Roosevelt moved much more aggressively after his 1904 election. Public demand for effective national regulation of interstate railroad rates had been growing since the Supreme Court had emasculated the Interstate Commerce Commission's (ICC) rate-making authority in the 1890s. Determined to bring the railroads—the country's single greatest private economic interest—under effective national control, Roosevelt waged an unrelenting battle with Congress in 1905–06. The outcome—the Hepburn Act of 1906—was his own personal triumph; it greatly enlarged the ICC's jurisdiction and forbade railroads to increase rates without its approval. By using the same tactics of aggressive leadership, Roosevelt in 1906 also obtained passage of a Meat Inspection Act and a Pure Food and Drug Act. Passage of the former was aided by the publication of Upton Sinclair's famous novel, *The Jungle* (1906), which revealed in gory detail the unsanitary conditions of the Chicago stockyards and meat-packing plants.

Meanwhile, almost from his accession to the presidency, Roosevelt had been carrying on a crusade, often independent of Congress, to conserve the nation's fast-dwindling natural resources and to make them available for exploitation under rigorous national supervision. He withdrew from the public domain some 148,000,000 acres of forest lands, 80,000,000 acres of mineral lands, and 1,500,000 acres of water-power sites. Moreover, adoption of the National Reclamation Act of 1902 made possible the beginning of an ambitious federal program of irrigation and hydroelectric development in the West.

Republican troubles under William Howard Taft. Roosevelt was so much the idol of the masses of 1908 that he could have easily gained the Republican nomination in that year. After his election in 1904, however, he had announced that he would not be a candidate four years later; adhering stubbornly to his pledge, he arranged the nomination of his secretary of war, William Howard Taft of Ohio, who easily defeated Bryan.

Taft might have made an ideal president during a time of domestic tranquility, but his tenure in the White House was far from peaceful. National progressivism was nearly at high tide; and a large group of Republican progressives, called "insurgents," sat in both houses of Congress.

The Republican insurgents. These Republicans, like a majority of Americans, demanded such reforms as tariff reductions, an income tax, the direct election of senators, and even stricter railroad and corporation regulations. Taft, who had strongly supported Roosevelt's policies, thought of himself as a progressive. Actually he was temperamentally and philosophically a conservative; more-

Marginal notes:

The breaking of the trusts

The high tide of progressivism

over, he lacked the qualities of a dynamic popular leader. In the circumstances, his ineptness, indecision, and failure to lead could only spell disaster for his party.

Taft's troubles began when he called Congress into special session in 1909 to take up the first item on his agenda—tariff reform. The measure that emerged from Congress actually increased rates. Republican insurgents and a majority of Americans were outraged, but Taft signed the bill and called it the best tariff law the Republicans had ever enacted. Conflicts and misunderstandings over conservation and legislative procedure caused the rift between Taft Republicans and the insurgents to grow. By 1910 the Republican insurgents were clearly in the ascendancy in the Congress. Taking control of the president's railroad-regulation measure, they added new provisions that greatly enlarged the ICC's authority. The following year they bitterly opposed Taft's measure for tariff reciprocity with Canada; it passed with Democratic support in Congress, only to go down to defeat at the hands of the Canadian electorate.

The 1912 election. Republican insurgents were determined to prevent Taft's renomination in 1912. They found their leader in Roosevelt, who had become increasingly alienated from Taft and who made a whirlwind campaign for the presidential nomination in the winter and spring of 1912. Roosevelt swept the presidential primaries, even in Taft's own state of Ohio; but Taft and conservative Republicans controlled the powerful state organizations and the Republican National Committee and were able to nominate Taft by a narrow margin. Convinced that the bosses had stolen the nomination from him, Roosevelt led his followers out of the Republican convention. In August they organized the Progressive ("Bull Moose") Party and named Roosevelt to lead the third-party cause.

Democrats had swept the 1910 congressional and gubernatorial elections; and, after the disruption of the Republican Party in the spring of 1912, it was obvious that almost any passable Democrat could win the presidency in that year. Woodrow Wilson, former president of Princeton University, who had made a brilliant Progressive record as governor of New Jersey, was nominated by the Democrats on the 46th ballot.

Taft's single objective in the 1912 campaign was to defeat Roosevelt. The real contest was between Roosevelt and Wilson for control of the Progressive majority. Campaigning strenuously on a platform that he called the New Nationalism, Roosevelt demanded effective control of big business through a strong federal commission, radical tax reform, and a whole series of measures to put the federal government squarely into the business of social and economic reform. By contrast Wilson seemed conservative with a program he called the New Freedom; it envisaged a concerted effort to destroy monopoly and to open the doors of economic opportunity to small businessmen through drastic tariff reduction, banking reform, and severe tightening of the antitrust laws. Roosevelt outpolled Taft in the election, but he failed to win many Democratic Progressives away from Wilson, who won by a huge majority of electoral votes, though receiving only about 42 percent of the popular vote.

The New Freedom and its transformation. A trained political scientist and historian, Wilson believed that the president should be the leader of public opinion, the chief formulator of legislative policy, and virtually sovereign in the conduct of foreign relations. With the support of an aroused public opinion and a compliant Democratic majority, he was able to put his theories of leadership into effect with spectacular success.

Wilson's domestic program The first item in Wilson's program was tariff reform, a perennial Democratic objective since the Civil War; the president's measure, the Underwood Tariff Act of 1913, reduced average rates from 40 percent to 25 percent, greatly enlarged the free list, and included a modest income tax. Next came adoption of the president's measure for banking and monetary reform, the Federal Reserve Act of 1913, which created a federal reserve system to mobilize banking reserves and issue a flexible new currency—federal reserve notes—based on gold and commercial paper; uniting and supervising the entire system was a federal reserve board of presidential appointees.

The third, and Wilson thought the last, part of the New Freedom program was antitrust reform. In his first significant movement toward Roosevelt's New Nationalism, Wilson reversed his position that merely strengthening the Sherman Anti-Trust Act would suffice to prevent monopoly. Instead, he took up and pushed through Congress the Progressive-sponsored Federal Trade Commission Act of 1914. It established an agency—the Federal Trade Commission (FTC)—with sweeping authority to prevent business practices that would lead to monopoly. Meanwhile, Wilson had abandoned his original measure, the Clayton Anti-Trust Act passed by Congress in 1914; its severe provisions against interlocking directorates and practices tending toward monopoly had been gravely weakened by the time the president signed it. The Clayton Act included a declaration that labour unions, as such, were not to be construed as conspiracies in restraint of trade in violation of the antitrust laws; but what organized labour wanted, and did not get, was immunity from prosecution for such measures as the sympathetic strike and the secondary boycott, which the courts had proscribed as violations of the Sherman Act.

In a public letter in November 1914, the president announced that his reform program was complete. But various groups were still demanding the advanced kind of social and economic legislation that Roosevelt had advocated in 1912; also, by early 1916 the Progressive Party had largely disintegrated, and Wilson knew that he could win reelection only with the support of a substantial minority of Roosevelt's former followers. Consequently—and also because his own political thinking had been moving toward a more advanced Progressive position—Wilson struck out upon a new political course in 1916. He began by appointing Louis D. Brandeis, the leading critic of big business and finance, to the Supreme Court. Then in quick succession he obtained passage of a rural-credits measure to supply cheap long-term credit to farmers; anti-child-labour and federal workmen's-compensation legislation; the Adamson Act, establishing the eight-hour day for interstate railroad workers; and measures for federal aid to education and highway construction. With such a program behind him, Wilson was able to rally a new coalition of Democrats, former Progressives, independents, social workers, and a large minority of Socialists; and he narrowly defeated his Republican opponent, Charles Evans Hughes, in the 1916 presidential election.

THE RISE TO WORLD POWER

Woodrow Wilson and the Mexican Revolution. Although Wilson's consuming interest was in domestic politics, he had to deal primarily with foreign affairs while in the White House; and before the end of his presidency he had developed into a diplomatist of great skill as well as one of the commanding figures in world affairs. He was a "strong" president in the conduct of foreign policy, writing most of the important diplomatic correspondence of his government and making all important decisions himself. He usually worked well with his secretaries of state, Bryan and Robert Lansing, and often relied for advice upon his confidential counselor, Colonel Edward M. House of Texas.

Wilson's conduct of foreign affairs

Wilson served his apprenticeship by having to deal at the outset of his administration with an uprising in Mexico, set off when a military usurper, Victoriano Huerta, murdered liberal president Francisco Madero and seized the executive power in February 1913. It was difficult for the United States to remain aloof because Americans had invested heavily in Mexico and 40,000 U.S. citizens resided there.

If Wilson had followed conventional policy and the urgings of Americans with interests in Mexico, he would have recognized Huerta (as most European governments did), who promised to respect and protect all foreign investments and concessions. But Wilson was revolted by Huerta's bloody rise to power; moreover, he believed that the revolution begun by Madero in 1910 was a glorious episode in the history of human liberty. Wilson thus not only refused to recognize Huerta but also tried to persuade the dictator to step down from office and permit the hold-

ing of free elections for a new democratic government. When Huerta refused to cooperate, Wilson gave open support to the Constitutionalists—Huerta's opponents under Madero's successor, Venustiano Carranza—and, when it seemed that the Constitutionalists could not themselves drive Huerta from power, Wilson seized the port of Veracruz in April 1914 to cut off Huerta's supplies and revenues. This stratagem succeeded, and Carranza and his army occupied Mexico City in August.

The revolutionary forces then divided between Carranza's followers and those of his chief rival and most colorful general, Pancho Villa; and civil war raged for another year. Wilson refused to interfere. Carranza emerged victoriously by the summer of 1915, and Wilson accorded him de facto recognition in October. But Villa, seeking to provoke war between the United States and Mexico, raided Columbus, N.M., on March 9, 1916, burning the town and killing 19 inhabitants. Wilson sent a punitive expedition under General John J. Pershing into Mexico in hot pursuit of Villa; but the wily guerrilla eluded Pershing, and, the deeper the U.S. forces penetrated into Mexican territory, the more agitated the Carranza government became. There were two serious skirmishes between regular Mexican and U.S. troops in the spring, and full-scale war was averted only when Wilson withdrew Pershing's column some months later. Relations between the two governments were greatly improved when Wilson extended de jure recognition to Carranza's new Constitutional regime in April 1917. Thereafter, Wilson adamantly rejected all further foreign and American suggestions for intervention in Mexico.

The struggle for neutrality. The outbreak of general war in Europe in August 1914 raised grave challenges to Wilson's skill and leadership in foreign affairs. In spite of the appeals of propagandists for the rival Allies and Central Powers, the great majority of Americans were doggedly neutral and determined to avoid involvement unless American rights and interests were grossly violated. This, too, was Wilson's own feeling, and in August he issued an official proclamation of neutrality and two weeks later appealed to Americans to be "impartial in thought as well as in action."

Loans and supplies for the Allies. Difficulties arose first with the British government, which at once used its vast fleet to establish a long-range blockade of Germany. The U.S. State Department sent several strong protests to London, particularly against British suppression of American exports of food and raw materials to Germany. Anglo-American blockade controversies were not acute, however, because the British put their blockade controls into effect gradually, always paid for goods seized, argued persuasively that in a total war food and raw materials were as essential as guns and ammunition, and pointed out that they, the British, were simply following blockade precedents established by the United States itself during the American Civil War. As a result of a tacit Anglo-American agreement, the United States soon became the chief external source of supply for the food, raw materials, and munitions that fed the British and French war machines. In addition, and in accordance with the strict rules of neutrality, the Wilson administration permitted the Allied governments to borrow more than $2,000,000,000 in the United States in order to finance the war trade. At the same time, the president resisted all efforts by German Americans for an arms embargo on the ground that such a measure would be grossly unneutral toward the Allies.

German submarine warfare. There was no possibility of conflict between Germany and the United States so long as the former confined its warfare to the continent of Europe; a new situation full of potential danger arose, however, when the German authorities decided to use their new weapon, the submarine, to challenge British control of the seas. The German admiralty announced in February 1915 that all Allied vessels would be torpedoed without warning in a broad area and that even neutral vessels were not safe. Wilson replied at once that he would hold Germany to "strict accountability" (a conventional diplomatic term) if submarines destroyed American ships and lives without warning. The Germans soon gave broad guarantees concerning American ships, and their safety

against illegal submarine attacks was not an issue between the two countries before 1917.

An issue much more fraught with danger was the safety of Americans traveling and working on Allied ships. A German submarine sank the unarmed British liner *Lusitania* without warning on May 7, 1915, killing, among others, 128 Americans. Wilson at first appealed to the Germans on broad grounds of humanity to abandon submarine warfare, but in the subsequent negotiations he narrowed the issue to one of safety for unarmed passenger liners against violent underseas attack. Momentary resolution came when a submarine sank the unarmed British liner *Arabic* in August. Wilson warned that he would break diplomatic relations if such attacks continued, and the Germans grudgingly promised not to attack unarmed passenger ships without warning. The controversy escalated to a more dangerous level when a submarine torpedoed the packet steamer *Sussex* in the English Channel with heavy loss of life in March 1916. In an ultimatum to Berlin, Wilson threatened to break diplomatic relations if the Germans did not cease attacking liners and merchantmen without warning; once again the Germans capitulated, but they threatened to resume unrestricted submarine warfare if the United States failed to force the British to observe international law in their blockade practices.

The Allies complicated the submarine controversy in late 1915 by arming many of their liners and merchantmen sailing to American ports. Wilson tried to arrange a compromise by which the Allies would disarm their ships in return for a German promise not to sink them without warning. When the British rejected the proposal, the president gave the impression that he would hold Germany accountable for American lives lost on armed ships, setting off a rebellion in Congress and the near passage of resolutions forbidding American citizens to travel on armed ships. Actually, the president had no intention of permitting armed ships to become a serious issue; their status was never a subject of serious controversy between the United States and Germany.

Arming for war. Meanwhile, the increasingly perilous state of relations with Germany had prompted Wilson, in December 1915, to call for a considerable expansion in the nation's armed forces. A violent controversy over preparedness ensued, both in Congress and in the country at large. The army legislation of 1916 was a compromise, with Wilson obtaining only a modest increase in the army and a strengthening of the National Guard; but the Naval Appropriations Act of 1916 provided for more ships than the administration had requested.

The United States enters the Great War. Wilson's most passionate desire, aside from avoiding belligerency, was to bring an end to the war through his personal mediation. He sent Colonel House to Europe in early 1915 to explore the possibilities of peace and again early in 1916 to press for a plan of Anglo-American cooperation for peace. The British refused to cooperate, and the president, more than ever eager to avoid a final confrontation with Germany on the submarine issue, decided to press forward with independent mediation. He was by this time also angered by the intensification of British blockade practices and convinced that both sides were fighting for world domination and spoils. On Dec. 18, 1916, Wilson asked the belligerents to state the terms upon which they would be willing to make peace. Soon afterward, in secret, high-level negotiations, he appealed to Britain and Germany to hold an early peace conference under his leadership.

Break with Germany. Chances for peace were blasted by a decision of the German leaders, made at an imperial conference on Jan. 9, 1917, to inaugurate an all-out submarine war against all commerce, neutral as well as belligerent. The Germans knew that such a campaign would bring the United States into the war; but they were confident that their augmented submarine fleet could starve Britain into submission before the United States could mobilize and participate effectively.

The announcement of the new submarine blockade in January left the president no alternative but to break diplomatic relations with Germany, which he did on February 3. At the same time, and in subsequent addresses, the

president made it clear that he would accept unrestricted submarine warfare against belligerent merchantmen and would act only if American ships were sunk. In early March he put arms on American ships in the hope that this would deter submarine attacks. The Germans began to sink American ships indiscriminately in mid-March, and on April 2 Wilson asked Congress to recognize that a state of war existed between the United States and the German Empire. Congress approved the war resolution quickly, and Wilson signed it on April 6. (For U.S. military involvement in World War I, see the article WORLD WARS.)

Mobilization. Generally speaking, the efforts at mobilization went through two stages. During the first, lasting roughly from April to December 1917, the administration relied mainly on voluntary and cooperative efforts. During the second stage, after December 1917, the government moved rapidly to establish complete control over every important phase of economic life. Railroads were nationalized; a war industries board established ironclad controls over industry; food and fuel were strictly rationed; an emergency-fleet corporation began construction of a vast merchant fleet; and a war labour board used coercive measures to prevent strikes. Opposition to the war was sternly suppressed under the Espionage Act of 1917. At the same time, the Committee on Public Information, headed by the progressive journalist George Creel, mobilized publicists, scholars, and others in a vast prowar propaganda effort. By the spring of 1918, the American people and their economy had been harnessed for total war (a near miracle, considering the lack of preparedness only a year before).

America's role in the war. The American military contribution, while small compared to that of the Allies during the entire war, was in two respects decisive in the outcome. The U.S. Navy, fully prepared at the outset, provided the ships that helped the British overcome the submarine threat by the autumn of 1917. The U.S. Army, some 4,000,000 men strong, was raised mainly by conscription under the Selective Service Act of 1917; the American Expeditionary Force of more than 1,200,000 men under General Pershing reached France by September 1918, and this huge infusion of manpower tipped the balance on the Western Front and helped to end the war in November 1918, a year earlier than military planners had anticipated.

Wilson's vision of a new world order. In one of the most ambitious rhetorical efforts in modern history, President Wilson attempted to rally the people of the world in a movement for a peace settlement that would remove the causes of future wars and establish machinery to maintain peace. In an address to the Senate on Jan. 22, 1917, he called for a "peace without victory" to be enforced by a league of nations that the United States would join and strongly support. He reiterated this program in his war message, adding that the United States wanted above all else to "make the world safe for democracy." And when he failed to persuade the British and French leaders to join him in issuing a common statement of war aims, he went to Congress on Jan. 8, 1918, to make, in his Fourteen Points address, his definitive avowal to the American people and the world.

In his general points Wilson demanded an end to the old diplomacy that had led to wars in the past. He proposed open diplomacy instead of entangling alliances, and he called for freedom of the seas, an impartial settlement of colonial claims, general disarmament, removal of artificial trade barriers, and, most important, a league of nations to promote peace and protect the territorial integrity and independence of its members. On specific issues he demanded, among other things, the restoration of a Belgium ravaged by the Germans; sympathetic treatment of the Russians, then involved in a civil war; establishment of an independent Poland; the return of Alsace-Lorraine to France; and autonomy or self-determination for the subject peoples of the Austro-Hungarian and Ottoman empires. A breathtaking pronouncement, the Fourteen Points gave new hope to millions of liberals and moderate socialists who were fighting for a new international order based upon peace and justice.

Government controls during the war

Wilson's Fourteen Points

The Paris Peace Conference and the Versailles Treaty. With their armies reeling under the weight of a combined Allied and American assault, the Germans appealed to Wilson in October 1918 for an armistice based on the Fourteen Points and other presidential pronouncements. The Allies agreed to conclude peace on this basis, except that the British entered a reservation about freedom of the seas, and Wilson agreed to an Anglo-French demand that the Germans be required to make reparation for damages to civilian property.

Wilson led the U.S. delegation and a large group of experts to the peace conference, which opened in Paris in January 1919. He fought heroically for his Fourteen Points against the Allied leaders—David Lloyd George of Britain, Georges Clemenceau of France, and Vittorio Orlando of Italy—who, under heavy pressure from their own constituencies, were determined to divide the territories of the vanquished and make Germany pay the full cost of the war. Wilson made a number of compromises that violated the spirit if not the letter of the Fourteen Points, including the imposition of an indefinitely large reparations bill upon Germany. Moreover, the Allies had intervened in the Russian Civil War against the dominant revolutionary socialist faction, the Bolsheviks; and Wilson had halfheartedly cooperated with the Allies by dispatching small numbers of troops to northern Russia, to protect military supplies against the advancing Germans, and to Siberia, mainly to keep an eye on the Japanese, who had sent a large force there. But Wilson won many more of his Fourteen Points than he lost; his greatest victories were to prevent the dismemberment of Germany in the west and further intervention in Russia and, most important, to obtain the incorporation of the Covenant of the League of Nations into the Versailles Treaty. He was confident that the League, under American leadership, would soon rectify the injustices of the treaty.

The fight over the treaty and the election of 1920. Public opinion in the United States seemed strongly in favour of quick ratification of the Versailles Treaty when the president presented that document to the Senate in July 1919. Traditional isolationist sentiment was beginning to revive, however, and a small minority of 16 senators, irreconcilably opposed to U.S. membership in the League, vowed to oppose the treaty to the bitter end. In addition, a crucial controversy developed between the president and a majority of the Republican senators, led by Henry Cabot Lodge of Massachusetts. Lodge insisted upon adding 14 reservations to the treaty. The second reservation declared that the United States assumed no obligations under Article X of the Covenant, which guaranteed the integrity and independence of members of the League; moreover it said that the president could not use the armed forces to support the Covenant without the explicit consent of Congress.

Calling this reservation a nullification of the treaty, Wilson in September made a long speaking tour of the West to build up public support for unconditional ratification. He suffered a breakdown at the end of his tour and a serious stroke on October 2. The president's illness, which incapacitated him for several months, increased his intransigence against the Lodge reservations; with equal stubbornness, the Massachusetts senator refused to consent to any compromise. The result was failure to obtain the necessary two-thirds majority for ratification, with or without reservations, when the Senate voted on Nov. 19, 1919, and again on March 19, 1920.

Wilson had suggested that the ensuing presidential campaign and election should be a "great and solemn referendum" on the League. The Democratic candidate, James M. Cox of Ohio, fought hard to make it the leading issue; but the Republican candidate, Warren G. Harding of Ohio, was evasive on the subject, and a group of 31 leading Republican internationalists assured the country that Harding's election would be the best guarantee of U.S. membership in the League of Nations. Harding swamped Cox, and his victory ended all hopes for U.S. membership. In his inaugural Harding announced that the United States would not be entangled in European affairs; he emphasized this determination by concluding a separate peace with Germany in 1921.   (A.S.L.)

The League of Nations

The United States from 1920 to 1945

Postwar conservatism. After the end of World War I, many Americans were left with a feeling of distrust toward foreigners and radicals, whom they held responsible for the war. The Russian Revolution of 1917 and the founding of the communists' Third International in 1919 further fanned American fears of radicalism. Race riots and labour unrest added to the tension. Thus, when a series of strikes and indiscriminate bombings began in 1919, the unrelated incidents were all assumed—incorrectly in most cases—to be communist-inspired. During the ensuing Red Scare, civil liberties were sometimes grossly violated and many innocent aliens were deported. The Red Scare was over within a year, but a general distrust of foreigners, liberal reform movements, and organized labour remained throughout the 1920s. In fact, many viewed Harding's landslide victory in 1920 as a repudiation of Wilson's internationalism and of the reforms of the Progressive era.

Peace and prosperity. Harding took office with a clear mandate to restore business as usual, a condition he termed "normalcy." Americans wished to put reminders of the Great War behind them, as well as the brutal strikes, the Red Scare, and the sharp recession of Wilson's last years in office. Peace and prosperity were what people desired, and these would be achieved under Harding.

The return to "normalcy"

As part of his policy of returning America to prewar conditions, Harding pardoned many individuals who had been convicted of antiwar activities or for being radicals. His main concern, however, was business. Reversing progressive and wartime trends, the Harding administration strove to establish probusiness policies. Attorney General Harry M. Daugherty obtained injunctions against striking workers. The Supreme Court sided with management in disputes over unions, minimum wage laws, child labour, and other issues. Secretary of Commerce Herbert Hoover expanded the size of his department fourfold during the next eight years in attempts to foster business growth and efficiency and to encourage trade associations and business–labour cooperation. Secretary of the Treasury Andrew W. Mellon, one of the nation's richest men, drastically cut taxes, especially on the wealthy; he also cut federal spending to reduce the national debt.

In foreign affairs the Harding administration tried to ensure peace by urging disarmament, and at the Washington Naval Conference in 1921 Secretary of State Charles Evans Hughes negotiated the first effective arms-reduction agreement in history. On the whole, however, the policies of the United States were narrow and nationalistic. It did not cooperate with the League of Nations. It insisted that Europeans pay their American debts but in 1922 passed the Fordney–McCumber Tariff, which raised duties so high that foreigners had great difficulty earning the necessary dollars. When immigration reached prewar levels (some 800,000 people entered the country between June 1920 and June 1921), Congress gave in to the protests of organized labour, which believed immigrants were taking jobs away from American citizens, and to the objections of business leaders and patriotic organizations, who feared that some of the immigrants might be radicals. Reversing traditional American policy, Congress passed first an emergency restriction bill and then in 1924 the National Origins Act. The act set a quota limiting the number of immigrants to 164,000 annually (150,000 after July 1, 1927); it discriminated against immigrants from southern and eastern Europe and barred Asians completely. The quota did not pertain to North Americans, however.

Harding's policies, his genial nature, and the return of prosperity made the president extremely popular. His sudden death, of a cerebral embolism, in the summer of 1923 resulted in a national outpouring of grief. Yet it soon became evident that his administration had been the most corrupt since Grant's. Harding had appointed venal mediocrities, many of them old cronies, to office, and they had betrayed his trust. The most publicized scandal was the illegal leasing of naval oil reserves at Teapot Dome, Wyo., which led to the conviction of Secretary of the Interior Albert B. Fall for accepting a bribe.

The Teapot Dome scandal

Calvin Coolidge, Harding's vice president and successor, was a taciturn, parsimonious New Englander who restored honesty to government. His administration suffered none of the stigma of the Harding scandals, and Coolidge, thanks to a buoyant economy and a divided Democratic Party, easily defeated the conservative Democrat John W. Davis in the election of 1924. Even though an independent campaign by Senator Robert M. La Follette of Wisconsin drew off insurgent Republicans, Coolidge received more popular, and electoral, votes than his opponents combined.

Coolidge followed Harding's policies, and prosperity continued for most of the decade. From 1922 to 1929, stock dividends rose by 108 percent, corporate profits by 76 percent, and wages by 33 percent. In 1929, 4,455,100 passenger cars were sold by American factories, one for every 27 members of the population, a record that was not broken until 1950. Productivity was the key to America's economic growth. Because of improvements in technology, overall labour costs declined by nearly 10 percent, even though the wages of individual workers rose.

The prosperity was not solidly based, however. The wealthy benefited most, and agriculture and several industries, such as textiles and bituminous coal mining, were seriously depressed; after 1926 construction declined.

New social trends. For millions of Americans, the sober-minded Coolidge was a more appropriate symbol for the era than the journalistic terms Jazz Age or Roaring Twenties. These terms were exaggerations, but they did have some basis in fact. Many young men and women who had been disillusioned by their experiences in World War I rebelled against what they viewed as unsuccessful, outmoded prewar conventions and attitudes. Women who had been forced to work outside the home because of labour shortages during the war were unwilling to give up their social and economic independence after the war had ended. Having won the right to vote when the Nineteenth Amendment was ratified in 1920, the new "emancipated" woman, the flapper, demanded to be recognized as man's equal in all areas. She adopted a masculine look, bobbing her hair and abandoning corsets; she drank and smoked in public; and she was more open about sex.

The Jazz Age

Social changes were not limited to the young. Productivity gains brought most Americans up to at least a modest level of comfort. People were working fewer hours a week and earning more money than ever before. New consumer goods—radios, telephones, refrigerators, and above all the motor car—made life better, and they were easier to buy thanks to a vastly expanded consumer credit system. Leisure activities became more important, professional sports boomed, and the rapid growth of tabloid newspapers, magazines, movies, and radios enabled millions to share in the exciting world of speakeasies, flappers, and jazz music, even if only vicariously.

On the darker side, antiforeign sentiment led to the revival of the racist, anti-Semitic, and anti-Catholic Ku Klux Klan, especially in rural areas. During the early 1920s the Klan achieved a membership of some 5,000,-000 and gained control of, or influence over, many city and state governments. Rural areas also provided the base for a Christian fundamentalist movement, as farmers and small-town dwellers who felt threatened and alienated by the rapidly expanding, socially changing cities fought to preserve American moral standards by stressing religious orthodoxy. The movement grew steadily until 1925, when John T. Scopes, a biology teacher in Dayton, Tenn., was tried for violating a law common to many Southern states prohibiting the teaching of the theory of evolution. Although Scopes was found guilty of breaking the law, both the law itself and fundamentalist beliefs were ridiculed during the course of the trial, which attracted national attention.

One fundamentalist goal that was achieved was the passage in 1919 of the Prohibition (Eighteenth) Amendment, which prohibited the manufacture, sale, or transportation of intoxicating liquors. Millions of mostly Protestant churchgoers hailed Prohibition as a moral advance, and the liquor consumption of working people, as well as the incidence of alcohol-related diseases and deaths, does seem to have dropped during the period. On the other

Prohibition

hand, millions of otherwise law-abiding citizens drank the prohibited liquor, prompting the growth of organized crime. The illegal liquor business was so lucrative and federal prohibition enforcement machinery was so slight that gangsters were soon engaged in the large-scale smuggling, manufacture, and sale of alcoholic beverages.

As in legitimate business, the highest profits came from achieving economies of scale, so gangsters engaged in complex mergers and takeovers; but, unlike corporate warfare, the underworld used real guns to wipe out competition. In 1931 a national law-enforcement commission, formed to study the flouting of prohibition and the activities of gangsters, was to report that prohibition was virtually unenforceable; and, with the coming of the Great Depression, prohibition ceased to be a key political issue. In 1933 the Twenty-first Amendment brought its repeal.

In the meantime, prohibition and religion were the major issues of the 1928 presidential campaign between the Republican nominee, Herbert Hoover, and the Democrat, Governor Alfred E. Smith of New York. Smith was an opponent of prohibition and a Roman Catholic. His candidacy brought enthusiasm and a heavy Democratic vote in the large cities, but a landslide against him in the dry and Protestant hinterlands secured the election for Hoover.

The Great Depression. In October 1929, only months after Hoover took office, the stock market crashed, the average value of 50 leading stocks falling by almost half in two months. Despite occasional rallies, the slide persisted until 1932, when stock averages were barely a fourth of what they had been in 1929. Industrial production soon followed the stock market, giving rise to the worst unemployment the country had ever seen. By 1933 at least a quarter of the work force was unemployed. Adjusted for deflation, salaries had fallen by 40 percent and industrial wages by 60 percent.

The causes of the Great Depression were many and various. Agriculture had collapsed in 1919 and was a continuing source of weakness. Because of poor regulatory policies, many banks were overextended. Wages had not kept up with profits, and by the late 1920s consumers were reaching the limits of their ability to borrow and spend. Production had already begun to decline and unemployment to rise before the crash. The crash, which was inevitable since stock prices were much in excess of real value, greatly accelerated every bad tendency, destroying the confidence of investors and consumers alike.

Hoover met the crisis energetically, in contrast to earlier administrations, which had done little to cope with panics except reduce government spending. He extracted promises from manufacturers to maintain production. He signed legislation providing generous additional sums for public works. He also signed the infamous Smoot–Hawley Tariff of 1930, which raised duties by as much as 50 percent. These steps failed to ease the depression, however, while the tariff helped to export it. International trade had never recovered from World War I. Europe still depended on American sales and investments for income and on American loans to maintain the complicated structure of debt payments and reparations erected in the 1920s. After the crash Americans stopped investing in Europe, and the tariff deprived foreigners of their American markets. Foreign nations struck back with tariffs of their own, and all suffered from the resulting anarchy.

In the 1930 elections the Democratic Party won control of the House of Representatives and, in combination with liberal Republicans, the Senate as well. Soon afterward a slight rise in production and employment made it seem that the worst of the depression was over. Then, in the spring of 1931, another crisis erupted. The weakening western European economy brought down a major bank in Vienna, and Germany defaulted on its reparations payments. Hoover proposed a one-year moratorium on reparations and war-debt payments, but, even though the moratorium was adopted, it was too little too late. In the resulting financial panic most European governments went off the gold standard and devalued their currencies, thus destroying the exchange system, with devastating effects upon trade. Europeans withdrew gold from American banks, leading the banks to call in their loans to Amer-

The stock market crash of 1929

ican businesses. A cascade of bankruptcies ensued, bank customers collapsing first and after them the banks.

Hoover tried hard to stabilize the economy. He persuaded Congress to establish a Reconstruction Finance Corporation to lend funds to banks, railroads, insurance companies, and other institutions. At the same time, in January 1932, new capital was arranged for federal land banks. The Glass–Steagall Act provided gold to meet foreign withdrawals and liberalized Federal Reserve credit. The Federal Home Loan Bank Act sought to prop up threatened building and loan associations. But these measures failed to promote recovery or to arrest the rising tide of unemployment. Hoover, whose administrative abilities had masked severe political shortcomings, made things worse by offering negative leadership to the nation. His public addresses were conspicuously lacking in candor. He vetoed measures for direct federal relief, despite the fact that local governments and private charities, the traditional sources for welfare, were clearly incapable of providing adequate aid for the ever-rising numbers of homeless and hungry. When unemployed veterans refused to leave Washington after their request for immediate payment of approved bonuses was denied, Hoover sent out the army, which dispersed the protesters at bayonet point and burned down their makeshift quarters.

Anti-depression measures

Hoover's failures and mistakes guaranteed that whoever the Democrats nominated in 1932 would become the next president. Their candidate was Governor Franklin Delano Roosevelt of New York. He won the election by a large margin, and the Democrats won majorities in both branches of Congress.

THE NEW DEAL

The first New Deal. Roosevelt took office amid a terrifying bank crisis that had forced many states to suspend banking activities. He acted quickly to restore public confidence. On Inaugural Day, March 4, 1933, he declared that "the only thing we have to fear is fear itself." The next day he halted trading in gold and declared a national "bank holiday." On March 9 he submitted to Congress an Emergency Banking Bill authorizing government to strengthen, reorganize, and reopen solvent banks. The House passed the bill by acclamation, sight unseen, after only 38 minutes of debate. That night the Senate passed it unamended, 73 votes to 7. On March 12 Roosevelt announced that, on the following day, sound banks would begin to reopen. On March 13, deposits exceeded withdrawals in the first reopened banks. "Capitalism was saved in eight days," Raymond Moley, a member of the president's famous "brain trust," later observed.

In fact, the legal basis for the bank holiday was doubtful. The term itself was a misnomer, intended to give a festive air to what was actually a desperate last resort. Most of the reopened banks were not audited to establish their solvency; instead the public was asked to trust the president. Nevertheless, the bank holiday exemplified brilliant leadership at work. It restored confidence where all had been lost and saved the financial system. Roosevelt followed it up with legislation that did actually put the banking structure on a solid footing. The Glass–Steagall Act of 1933 separated commercial from investment banking and created the Federal Deposit Insurance Corporation to guarantee small deposits. The Banking Act of 1935 strengthened the Federal Reserve System, the first major improvement since its birth in 1913.

With the country enthusiastically behind him, Roosevelt kept Congress in special session and piece by piece sent it recommendations that formed the basic recovery program of his first 100 days in office. From March 9 to June 16, 1933, Congress enacted all of Roosevelt's proposals. Among the bills passed was one creating the Tennessee Valley Authority, which would build dams and power plants and in many other ways salvage a vast, impoverished region. The Securities Exchange Act gave the Federal Trade Commission broad new regulatory powers, which in 1934 were passed on to the newly created Securities and Exchange Commission. The Home Owners Loan Act established a corporation that refinanced one of every five mortgages on urban private residences. Other bills passed

Roosevelt's recovery program

during the Hundred Days, as well as subsequent legislation, provided aid for the unemployed and the working poor and attacked the problems of agriculture and business.

Relief. Nothing required more urgent attention than the masses of unemployed workers who, with their families, had soon overwhelmed the miserably underfinanced bodies that provided direct relief. On May 12, 1933, Congress established a Federal Emergency Relief Administration to distribute half a billion dollars to state and local agencies. Roosevelt also created the Civil Works Administration, which by January 1934 was employing more than 4,000,-000 men and women. Alarmed by rising costs, Roosevelt dismantled the CWA in 1934, but the persistence of high unemployment led him to make another about-face. In 1935 the Emergency Relief Appropriation Act provided almost $5,000,000,000 to create work for some 3,500,000 persons. The Public Works Administration (PWA), established in 1933, provided jobs on long-term construction projects, and the Civilian Conservation Corps put 2,500,-000 young men to work planting or otherwise improving huge tracts of forestland. For homeowners, the Federal Housing Administration began insuring private home-improvement loans to middle-income families in 1934; in 1938 it became a home-building agency as well.

Agricultural recovery. Hoover's Federal Farm Board had tried to end the long-standing agricultural depression by raising prices without limiting production. Roosevelt's Agricultural Adjustment Act (AAA) of 1933 was designed to correct the imbalance. Farmers who agreed to limit production would receive "parity" payments to balance prices between farm and nonfarm products, based on prewar income levels. Farmers benefited also from numerous other measures, such as the Farm Credit Act of 1933, which refinanced a fifth of all farm mortgages in a period of 18 months, and the creation in 1935 of the Rural Electrification Administration (REA), which did more to bring farmers into the 20th century than any other single act. Thanks to the REA, nine out of 10 farms were electrified by 1950, compared to one out of 10 in 1935.

These additional measures were made all the more important by the limited success of the AAA. Production did fall as intended, aided by the severe drought of 1933–36, and prices rose in consequence; but many, perhaps a majority, of farmers did not prosper as a result. The AAA was of more value to big operators than to small family farmers, who often could not meet their expenses if they restricted their output and therefore could not qualify for parity payments. The farm corporation, however, was able to slash its labour costs by cutting acreage and could cut costs further by using government subsidies to purchase machinery. Thus, even before the Supreme Court invalidated the AAA in 1936, support for it had diminished.

Business recovery. As the economic crisis was above all an industrial depression, business recovery headed the New Deal's list of priorities. Working toward that goal, the administration drafted the National Industrial Recovery Act of 1933, which, among other things, created a National Recovery Administration to help business leaders draw up and enforce codes governing prices, wages, and other matters (coded industries would be exempt from the antitrust laws). Labour was offered protection from unfair practices and given the right to bargain collectively. A large-scale public works appropriation, administered through the PWA, was intended to pour sufficient money into the economy to increase consumer buying power while prices and wages went up.

Despite great initial enthusiasm for the NRA program, it was a failure. The codes became too numerous and complex for proper enforcement, and they were resented because they tended to favour the leading producers in each regulated industry. The protections afforded labour proved illusory, while the PWA, despite an impressive building record that included not only dams, bridges, and schools but also aircraft carriers, was too slow and too small to have much effect on the economy as a whole.

Yet, even if the NRA had overcome its technical problems, failure would probably still have resulted. What the country needed was economic growth, but the NRA assumed that the United States had a mature economic

Agricultural Adjustment Act

structure incapable of further expansion. Accordingly, it worked to stabilize the economy, eliminate wasteful or predatory competition, and protect the rights of labour. Encouraging growth was not on its agenda.

The second New Deal and the Supreme Court. In reaction to pressures from the left and hostility from the right, the New Deal shifted more toward reform in 1935–36. Popular leaders, promising more than Roosevelt, threatened to pull sufficient votes from him in the 1936 election to bring Republican victory. Senator Huey P. Long of Louisiana was building a national following with a "Share the Wealth" program. The poor in Northern cities were attracted to the Roman Catholic priest Charles E. Coughlin, who later switched from a program of nationalization and currency inflation to an antidemocratic, anti-Semitic emphasis. Many older people supported Francis E. Townsend's plan to provide $200 per month for everyone over age 60. At the same time, conservatives, including such groups as the American Liberty League, founded in 1934, attacked the New Deal as a threat to states' rights, free enterprise, and the open shop.

Roosevelt's response in 1935 was to propose greater aid to the underprivileged and extensive reforms. Congress created the Works Progress Administration, which replaced direct relief with work relief; between 1935 and 1941 the WPA employed an annual average of 2,100,000 workers, including artists and writers, who built or improved schools, hospitals, airports, and other facilities by the tens of thousands. The National Youth Administration created part-time jobs for millions of college students, high-school students, and other youngsters. Of long-range significance was the Social Security Act of 1935, which provided federal aid for the aged, retirement annuities, unemployment insurance, aid for persons who were blind or crippled, and aid to dependent children; the original act suffered from various inadequacies, but it was the beginning of a permanent, expanding national program. A tax reform law fell heavily upon corporations and well-to-do people. The National Labor Relations Act, or Wagner Act, gave organized labour federal protection in collective bargaining; it prohibited a number of "unfair practices" on the part of employers and created the strong National Labor Relations Board to enforce the law.

In the 1936 elections Roosevelt, aided by his reform program, formed a coalition that included liberals, urban ethnics, farmers, trade unionists, and the elderly. He easily defeated the Republican nominee for president, Governor Alfred ("Alf") M. Landon of Kansas, receiving more than 60 percent of the popular vote and the electoral votes of every state except Maine and Vermont. The Democratic majorities in the House and Senate were also strengthened. Viewing his decisive victory as an electoral mandate for continued reform, Roosevelt sought to neutralize the Supreme Court, which in 1935 had invalidated several early New Deal reform measures and now seemed about to strike down the Wagner Act and the Social Security Act. In February 1937 Roosevelt created a furor by proposing a reorganization of the court system that would have included giving him the power to appoint up to six new justices, thus giving the court a liberal majority. Some Democrats and a few liberal Republicans in Congress supported the proposal, but a strong coalition of Republicans and conservative Democrats, backed by much public support, fought the so-called court-packing plan.

Meanwhile the court itself in a new series of decisions began upholding as constitutional measures involving both state and federal economic regulation. These decisions, which began an extensive revision of constitutional law concerning governmental regulation, made the reorganization plan unnecessary; the Senate defeated it in July 1937 by a vote of 70 to 22. Roosevelt had suffered a stinging political defeat, even though he no longer had to fear the court. Turnover on the court was rapid as older members retired or died; by 1942 all but two of the justices were Roosevelt appointees.

The culmination of the New Deal. Roosevelt lost further prestige in the summer of 1937, when the nation plunged into a sharp recession. Economists had feared an inflationary boom as industrial production moved up to

The shift toward reform

Roosevelt's court-packing plan

within 7.5 percent of 1929. Other indices were high except for a lag in capital investment and continued heavy unemployment. Roosevelt, fearing a boom and eager to balance the budget, cut government spending, which most economists felt had brought the recovery. The new Social Security taxes removed an additional $2,000,000,000 from circulation. Between August 1937 and May 1938 the index of production fell from 117 to 76 (on a 1929 base of 100), and unemployment increased by perhaps 4,000,000 persons. Congress voted an emergency appropriation of $5,000,000,000 for work relief and public works, and by June 1938 recovery once more was under way, although unemployment remained higher than before the recession.

Roosevelt's loss of power became evident in 1938, when his attempts to defeat conservative congressional Democrats in the primaries failed. In the fall Republicans gained 80 seats in the House and seven in the Senate. The Democratic Party retained nominal control of Congress, but conservative Democrats and Republicans voting together defeated many of Roosevelt's proposals. A few last bills slipped through. The U.S. Housing Authority was created in 1937 to provide low-cost public housing. In 1938 the Fair Labor Standards Act established a minimum wage and a maximum work week. Otherwise, the president seldom got what he asked for.

The rise of organized labour

Apart from the New Deal itself, no development in the 1930s was more important than the rise of organized labour. This too had negative, or at least mixed, effects upon Roosevelt's political power. When the depression struck, only 5 percent of the work force was unionized, compared to 12 percent in 1920. The great change began in 1935 when the American Federation of Labor's Committee for Industrial Organization broke away from its timid parent and, as the Congress of Industrial Organizations (after 1938), began unionizing the mass production industries. The CIO had a unique tool, the sit-down strike. Instead of picketing a plant, CIO strikers closed it down from inside, taking the factory hostage and preventing management from operating with nonunion workers. This, together with the new reluctance of authorities, many of them Roosevelt Democrats, to act against labour, made sit-down strikes highly successful. On Feb. 11, 1937, after a long sit-down strike, General Motors, the country's mightiest corporation, recognized the United Auto Workers. The United States Steel Corporation caved in less than a month later, and by 1941 some 10,500,000 workers were unionized, three times as many as a decade before. The CIO became a mainstay of the New Deal coalition, yet it also aroused great resentment among middle-class Americans, who opposed strikes in general but the CIO's tactics especially. This further narrowed Roosevelt's political base.

An assessment of the New Deal. The New Deal established federal responsibility for the welfare of the economy and the American people. At the time, conservative critics charged it was bringing statism or even socialism. Left-wing critics of a later generation charged just the reverse—that it bolstered the old order and prevented significant reform. Others suggested that the New Deal was no more than the extension and culmination of progressivism. In its early stages, the New Deal did perhaps begin where progressivism left off and built upon the Hoover program for fighting the depression. But Roosevelt soon took the New Deal well beyond Hoover and progressivism, establishing a precedent for large-scale social programs and for government participation in economic activities. Despite the importance of this growth of federal responsibility, the New Deal's greatest achievement was to restore faith in American democracy at a time when many people believed that the only choice left was between communism and fascism. Its greatest failure was its inability to bring about complete economic recovery. Some economists, notably John Maynard Keynes of Great Britain, were calling for massive deficit spending to promote recovery; and by 1937 the New Deal's own experience proved that pump priming worked, whereas spending cutbacks only hurt the economy. Roosevelt remained unpersuaded, however, and the depression lingered on until U.S. entry into World War II brought full employment.

The road to war. After World War I most Americans concluded that participating in international affairs had been a mistake. They sought peace through isolation and throughout the 1920s advocated a policy of disarmament and nonintervention. As a result, relations with Latin-American nations improved substantially under Hoover, an anti-imperialist. This enabled Roosevelt to establish what became known as the Good Neighbor Policy, which repudiated altogether the right of intervention in Latin America. By exercising restraint in the region as a whole and by withdrawing American occupation forces from the Caribbean, Roosevelt increased the prestige of the United States in Latin America to its highest level in memory.

As the European situation became more tense, the United States continued to hold to its isolationist policy. Congress, with the approval of Roosevelt and Secretary of State Cordell Hull, enacted a series of neutrality laws that legislated against the factors that supposedly had taken the United States into World War I. As Italy prepared to invade Ethiopia, Congress passed the Neutrality Act of 1935, embargoing shipment of arms to either aggressor or victim. Stronger legislation followed the outbreak of the Spanish Civil War in 1936, in effect penalizing the Spanish government, whose fascist enemies were receiving strong support from Benito Mussolini and Adolph Hitler.

The policy of neutrality

In the Pacific Roosevelt continued Hoover's policy of nonrecognition of Japan's conquests in Asia. When Japan invaded China in 1937, however, he seemed to begin moving away from isolationism. He did not invoke the Neutrality Act, which had just been revised, and in October he warned that war was like a disease and suggested that it might be desirable for peace-loving nations to "quarantine" aggressor nations. He then quickly denied that his statement had any policy implications, and by December, when Japanese aircraft sank a U.S. gunboat in the Yangtze River, thoughts of reprisal were stifled by public apathy and by Japan's offer of apologies and indemnities. With strong public opposition to foreign intervention, Roosevelt concentrated on regional defense, continuing to build up the navy and signing mutual security agreements with other governments in North and South America.

When Germany's invasion of Poland in 1939 touched off World War II, Roosevelt called Congress into special session to revise the Neutrality Act to allow belligerents (in reality only Great Britain and France, both on the Allied side) to purchase munitions on a cash-and-carry basis. With the fall of France to Germany in June 1940, Roosevelt, with heavy public support, threw the resources of the United States behind the British. He ordered the War and Navy departments to resupply British divisions that had been rescued at Dunkirk minus their weaponry, and in September he agreed to exchange 50 obsolescent destroyers for 99-year leases on eight British naval and air bases in the Western Hemisphere.

The question of how much and what type of additional aid should be given to the Allies became a major issue of the election of 1940, in which Roosevelt ran for an unprecedented third term. Public opinion polls, a new influence upon decision makers, showed that most Americans favoured Britain but still wished to stay out of war. Roosevelt's opponent, Wendell Willkie, capitalized on this and rose steadily in the polls by attacking the president as a warmonger. An alarmed Roosevelt fought back, going so far as to make what he knew was an empty promise. "Your boys," he said just before the election, "are not going to be sent into any foreign wars." In truth, both candidates realized that U.S. intervention in the war might become essential, contrary to their public statements. Roosevelt won a decisive victory.

Upon being returned to office, Roosevelt moved quickly to aid the Allies. His Lend-Lease Act, passed in March 1941 after vehement debate, committed the United States to supply the Allies on credit. When Germany, on March 25, extended its war zone to include Iceland and the Denmark Straits, Roosevelt retaliated in April by extending the American Neutrality Patrol to Iceland. In July the United States occupied Iceland, and U.S. naval vessels began escorting convoys of American and Icelandic ships. That

summer Lend-Lease was extended to the Soviet Union after it was invaded by Germany. In August Roosevelt met with the British prime minister, Winston Churchill, off the coast of Newfoundland to issue a set of war aims known as the Atlantic Charter. It called for national self-determination, larger economic opportunities, freedom from fear and want, freedom of the seas, and disarmament.

Although in retrospect U.S. entry into World War II seems inevitable, in 1941 it was still the subject of great debate. Isolationism was a great political force, and many influential individuals were determined that U.S. aid policy stop short of war. In fact, as late as Aug. 12, 1941, the House of Representatives extended the Selective Training and Service Act of 1940 by a vote of only 203 to 202. Despite isolationist resistance, Roosevelt pushed cautiously forward. In late August the navy added British and Allied ships to its Icelandic convoys. Its orders were to shoot German and Italian warships on sight, thus making the United States an undeclared participant in the Battle of the Atlantic. During October one U.S. destroyer was damaged by a German U-boat and another was sunk. The United States now embarked on an undeclared naval war against Germany, but Roosevelt refrained from asking for a formal declaration of war. According to public opinion polls, a majority of Americans still hoped to remain neutral.

The war question was soon resolved by events in the Pacific. As much as a distant neutral could, the United States had been supporting China in its war against Japan, yet it continued to sell Japan products and commodities essential to the Japanese war effort. Then, in July 1940, the United States applied an embargo on the sale of aviation gas, lubricants, and prime scrap metal to Japan. When Japanese armies invaded French Indochina in September with the apparent purpose of establishing bases for an attack on the East Indies, the United States struck back by embargoing all types of scrap iron and steel and by extending a loan to China. Japan promptly retaliated by signing a limited treaty of alliance, the Tripartite Pact, with Germany and Italy. Roosevelt extended a much larger loan to China and in December embargoed iron ore, pig iron, and a variety of other products.

Japan and the United States then entered into complex negotiations in the spring of 1941. Neither country would compromise on the China question, however, Japan refusing to withdraw and the United States insisting upon it. Believing that Japan intended to attack the East Indies, the United States stopped exporting oil to Japan at the end of the summer. In effect an ultimatum, since Japan had limited oil stocks and no alternative source of supply, the oil embargo confirmed Japan's decision to eliminate the U.S. Pacific Fleet and to conquer Southeast Asia, thereby becoming self-sufficient in crude oil and other vital resources. By the end of November Roosevelt and his military advisers knew (through intercepted Japanese messages) that a military attack was likely; they expected it to be against the East Indies or the Philippines. To their astonishment, on December 7 Japan directed its first blow against naval and air installations in Hawaii. In a bold surprise attack, Japanese aircraft destroyed or damaged 18 ships of war at Pearl Harbor, including the entire battleship force, and 347 planes. Total U.S. casualties amounted to 2,403 dead and 1,178 wounded.

On Dec. 8, 1941, Congress with only one dissenting vote declared war against Japan. Three days later Germany and Italy declared war against the United States; and Congress, voting unanimously, reciprocated. As a result of the attack on Pearl Harbor, the previously divided nation entered into the global struggle with virtual unanimity.

The United States at war. Although isolationism died at Pearl Harbor, its legacy of unpreparedness lived on. Anticipating war, Roosevelt and his advisers had been able to develop and execute some plans for military expansion, but public opinion prohibited large-scale appropriations for armament and defense. Thus, when Pearl Harbor was attacked, the United States had some 2,200,000 men under arms, but most were ill-trained and poorly equipped. Barely a handful of army divisions even approached a state of readiness. The Army Air Corps possessed only 1,100 combat planes, many of which were outdated. The navy

was better prepared, but it was too small to fight a two-ocean war and had barely been able to provide enough ships for convoy duty in the North Atlantic. Eventually more than 15,000,000 men and women would serve in the armed forces, but not until 1943 would the United States be strong enough to undertake large-scale offensive operations. (For U.S. military involvement in World War II, see the article WORLD WARS.)

War production. Roosevelt had begun establishing mobilization agencies in 1939, but none had sufficient power or authority to bring order out of the chaos generated as industry converted to war production. He therefore created the War Production Board in January 1942 to coordinate mobilization, and in 1943 an Office of War Mobilization was established to supervise the host of defense agencies that had sprung up in Washington, D.C. Gradually, a priorities system was devised to supply defense plants with raw materials; a synthetic rubber industry was developed from scratch; rationing conserved scarce resources; and the Office of Price Administration kept inflation under control.

After initial snarls and never-ending disputes, by the beginning of 1944 production was reaching astronomical totals—double those of all the enemy countries combined. Hailed at the time as a production miracle, this increase was about equal to what the country would have produced in peacetime, assuming full employment. War production might have risen even higher if regulation of civilian consumption and industry had been stricter.

Scientists, under the direction of the Office of Scientific Research and Development, played a more important role in production than in any previous war, making gains in rocketry, radar and sonar, and other areas. Among the new inventions was the proximity fuse, which contained a tiny radio that detonated an artillery shell in the vicinity of its target, making a direct hit unnecessary. Of greatest importance was the atomic bomb, developed by scientists in secrecy and first tested on July 6, 1945.

Develop-ment of the atomic bomb

Financing the war. The total cost of the war to the federal government between 1941 and 1945 was about $321,-000,000,000 (10 times as much as World War I). Taxes paid 41 percent of the cost, less than Roosevelt requested but more than the World War I figure of 33 percent. The remainder was financed by borrowing from financial institutions, an expensive method but one that Congress preferred over the alternatives of raising taxes even higher or making war bond purchases compulsory. In consequence the national debt increased fivefold, amounting to $259,000,000,000 in 1945. The Revenue Act of 1942 revolutionized the tax structure by increasing the number who paid income taxes from 13,000,000 to 50,000,000. At the same time, through taxes on excess profits and other sources of income, the rich were made to bear a larger part of the burden, making this the only period in modern history when wealth was significantly redistributed.

Social consequences of the war. Despite the vast number of men and women in uniform, civilian employment rose from 46,000,000 in 1940 to more than 53,000,000 in 1945. The pool of unemployed men dried up in 1943, and further employment increases consisted of women, minorities, and over- or underage males. These were not enough to meet all needs, and by the end of the year a manpower shortage had developed.

One result of this shortage was that blacks made significant social and economic progress. Although the armed forces continued to practice segregation, as did Red Cross blood banks, Roosevelt, under pressure from blacks, who were outraged by the refusal of defense industries to integrate their labour forces, signed Executive Order 8802 on June 25, 1941. It prohibited racial discrimination in job training programs and by defense contractors and established a Fair Employment Practices Committee to insure compliance. By the end of 1944 nearly 2,000,000 blacks were at work in defense industries. As black contributions to the military and industry increased, so did their demands for equality. This sometimes led to racial hostilities, as on June 20, 1943, when mobs of whites invaded the black section of Detroit. Nevertheless, the gains offset the losses. Lynching virtually died out, several states outlawed

The Atlantic Charter

Declara-tion of war

discriminatory voting practices, and others adopted fair employment laws.

Full employment also resulted in raised income levels, which, through a mixture of price and wage controls, were kept ahead of inflation. Despite both this increase in income and a no-strike pledge given by trade union leaders after Pearl Harbor, there were numerous labour actions. Workers resented wage ceilings because much of their increased income went to pay taxes and was earned by working overtime rather than through higher hourly rates. In consequence, there were almost 15,000 labour stoppages during the war at a cost of some 36,000,000 man-days. Strikes were greatly resented, particularly by the armed forces, but their effects were more symbolic than harmful. The time lost amounted to only one-ninth of 1 percent of all hours worked.

Because Pearl Harbor had united the nation, few people were prosecuted for disloyalty or sedition, unlike during World War I. The one glaring exception to this policy The re- was the scandalous treatment of Japanese and Americans location of of Japanese descent. In 1942, on the basis of groundless Japanese- racial fears and suspicions, virtually the entire Japanese-Americans American population of the West Coast, amounting to 110,000 persons, was rounded up and imprisoned in "relocation" centres, which the inmates regarded as concentration camps. The Japanese-Americans lost their liberty, and in most cases their property as well, despite the fact that the Federal Bureau of Investigation, which had already arrested those individuals it considered security risks, had verified their loyalty.

The 1944 election. Roosevelt soundly defeated Governor Thomas E. Dewey of New York in the 1944 election, but his margin of victory was smaller than it had been previously. His running mate, chosen by party leaders who disliked former vice president Henry A. Wallace for his extreme liberalism, was Senator Harry S. Truman of Missouri, a party Democrat who had distinguished himself by investigating fraud and waste among war contractors.

The new U.S. role in world affairs. The U.S. entry into World War II had brought an end to isolation, and President Roosevelt was determined to prevent a retreat into isolationism once the war was over. After a series of conferences in December 1941, Roosevelt and Prime Minister Churchill announced the formation of the United Nations, a wartime alliance of 26 nations. In 1943 Roosevelt began planning the organization of a postwar United Nations, meeting with congressional leaders to assure bipartisan support. The public supported Roosevelt's efforts, and that fall Congress passed resolutions committing the United States to membership in an international body "with power adequate to establish and to maintain a just and lasting peace." Finally, in the spring of 1945, delegates from 50 nations signed the charter for a permanent United Nations. In addition to political harmony, Roosevelt promoted economic cooperation, and, with his full support, in 1944 the World Bank and the International Monetary Fund were created to bar a return of the cutthroat economic nationalism that had prevailed before the war.

Throughout the war Roosevelt met with Churchill and Stalin to plan military strategy and postwar policy. His last great conference with them took place at Yalta in the Crimea in February 1945. There policies were agreed upon to enforce the unconditional surrender of Germany, to divide it into zones for occupation and policing by the respective Allied forces, and to provide democratic regimes in eastern European nations. A series of secret agreements were also made at Yalta; chief among these was the Soviet pledge to enter the war against Japan after the German surrender, in return for concessions in East Asia.

Roosevelt died suddenly of a cerebral hemorrhage on April 12 and was succeeded by Truman. In the following months the German armed forces collapsed, and on May 7 all German forces surrendered. In the Pacific the invasions of Iwo Jima and Okinawa in early 1945 brought Japan under a state of siege. In the summer, before an invasion could take place, the United States dropped atomic bombs on Hiroshima and Nagasaki. On September 2 the surrender of Japan was signed in Tokyo harbour on the battleship *Missouri*.   (F.Fr./W.L.O'N.)

The United States since 1945

THE PEAK COLD WAR YEARS, 1945–60

The Truman Doctrine and containment. Truman, who had been chosen as vice president for domestic political reasons, was poorly prepared to assume the presidency. He had no experience of foreign affairs, knew little about Roosevelt's intentions, and was intimidated by the giant shoes he now had to fill. His first decisions were dictated by events or plans already laid. In July, two months after the German forces surrendered, he met at Potsdam, Ger., with Stalin and Churchill (who was succeeded at the conference by Clement Attlee) to discuss future operations against Japan and a peace settlement for Europe. Little was accomplished, and there would not be another meeting between Soviet and American heads of state for 10 years.

Hopes that good relations between the superpowers would ensure world peace soon faded as a result of the Stalinization of eastern Europe and Soviet support of communist insurgencies in various parts of the globe. Events came to a head in 1947 when Britain, weakened by a failing economy, decided to pull out of the eastern Mediterranean. This would leave both Greece, where a communist-inspired civil war was raging, and Turkey to the mercies of the Soviet Union. Truman now came into his own as a national leader, asking Congress to appropriate aid to Greece and Turkey and asserting, in effect, that henceforth the United States must help free peoples in general to resist communist aggression. This policy, known as the Truman Doctrine, has been criticized for committing the United States to the support of unworthy regimes and for taking on greater burdens than it was safe to assume. At first, however, the Truman Doctrine was narrowly applied. Congress appropriated $400,000,000 for Greece and Turkey, saving both from falling into unfriendly hands, and thereafter the United States relied mainly on economic assistance to support its foreign policy.

The keystone of this policy, and its greatest success, was the European Recovery Program, usually called the Mar- The shall Plan. Europe's economy had failed to recover after Marshall the war, its paralysis being worsened by the exceptionally Plan severe winter of 1946–47. Thus, in June 1947 Secretary of State George C. Marshall proposed the greatest foreign-aid program in world history in order to bring Europe back to economic health. In 1948 Congress created the Economic Cooperation Administration and over the next five years poured some $13,000,000,000 worth of aid into western Europe. (Assistance was offered to Eastern-bloc countries also, but they were forced by Stalin to decline.) The plan restored economic vitality and confidence to the region, while undermining the local communist parties. In 1949 Truman proposed extending similar aid to underdeveloped nations throughout the world, but the resulting Point Four Program was less successful than the Marshall Plan. Experience showed that it was easier to rebuild a modern industrial economy than to develop one from scratch.

U.S. policy for limiting Soviet expansion had developed with remarkable speed. Soon after the collapse of hopes for world peace in 1945 and 1946, the Truman administration had accepted the danger posed by Soviet aggression and resolved to shore up noncommunist defenses at their most critical points. This policy, known as containment, a term suggested by its principal framer, George Kennan, resulted in the Truman Doctrine and the Marshall Plan, as well as in the decision to make the western zones of Germany (later West Germany) a pillar of strength. When the Soviet Union countered this development in June 1948 by blocking all surface routes into the western-occupied zones of Berlin, Britain and the United States supplied the sectors by air for almost a year until the Soviet Union called off the blockade. A logical culmination of U.S. policy was the creation in 1949 of the North Atlantic Treaty Organization (NATO), a military alliance among 12 (later 16) nations to resist Soviet aggression.

Containment worked less well in Asia. In December 1945 Truman sent General Marshall to China with instructions to work out an agreement between the Communist rebels and the Nationalist government of Chiang Kai-shek. This was an impossible task, and in the subsequent

fighting Mao Zedong's Communist forces prevailed. The Nationalist government fled to Taiwan in 1949, and the United States then decided to concentrate its East Asian policy upon strengthening occupied Japan, with much better results.

Postwar domestic reorganization. *Military and nuclear policies.* After the end of World War II the vast U.S. military establishment was dismantled, its strength falling from 12,000,000 men and women to about 1,500,000 in 1947. The navy and army air forces remained the world's strongest, however, and the U.S. monopoly of atomic weapons seemed to ensure security. In 1946 the United States formed an Atomic Energy Commission for purposes of research and development. The armed forces were reorganized under a secretary of defense by the National Security Act of 1947, which also created the U.S. Air Force as an independent service. In 1949 the services were brought together in a single Department of Defense, though each retained considerable autonomy. In that same year the Soviet Union exploded its own atomic device, opening an era of intense nuclear, and soon thermonuclear, competition.

Social and economic development. Peace brought with it new fears. Demobilizing the armed forces might result in massive unemployment and another depression. Or, conversely, the huge savings accumulated during the war could promote runaway inflation. The first anxiety proved groundless, even though government did little to ease the transition to a peacetime economy. War contracts were canceled, war agencies diminished or dissolved, and government-owned war plants sold to private parties. But, after laying off defense workers, manufacturers rapidly tooled up and began producing consumer goods in volume. The housing industry grew too, despite shortages of every kind, thanks to mass construction techniques pioneered by the firm of Levitt and Sons, Inc., and other developers. All this activity created millions of new jobs. The Serviceman's Readjustment Act of 1944, known as the G.I. Bill of Rights, also helped ease military personnel back into civilian life. It provided veterans with loans, educational subsidies, and other benefits.

Inflation was more troublesome. Congress lacked enthusiasm for wartime price controls and in June 1946 passed a bill preserving only limited controls. Truman vetoed the bill as inadequate, controls expired, and prices immediately soared. Congress then passed an even weaker price-control bill, which Truman signed. Nevertheless, by the end of the year, most price and wage controls had been lifted. In December the Office of Price Administration began to close down. As a result the consumer price index did not stabilize until 1948, when prices were more than a third above the 1945 level, while wage and salary income had risen by only about 15 percent.

Truman's difficulties with Congress had begun in September 1945 when he submitted a 21-point domestic program, including proposals for an expansion of social security and public housing and for the establishment of a permanent Fair Employment Practices Act banning discrimination. These and subsequent liberal initiatives, later known as the Fair Deal, were rejected by Congress, which passed only the Employment Act of 1946. This clearly stated the government's responsibility for maintaining full employment and established a Council of Economic Advisers to advise the president.

The Fair Deal

Truman's relations with Congress worsened after the 1946 elections. Voters, who were angered by the price-control debacle, a wave of strikes, and Truman's seeming inability to lead or govern, gave control of both houses of Congress to Republicans for the first time since 1928. The president and the extremely conservative 80th Congress battled from beginning to end, not over foreign policy, where bipartisanship prevailed, but over domestic matters. Congress passed two tax reductions over Truman's vetoes and in 1947, again over Truman's veto, passed the Taft–Hartley Act, which restricted unions while extending the rights of management. Congress also rejected various liberal measures submitted by Truman, who did not expect the proposals to pass but wanted Congress on record as having opposed important social legislation.

By 1948, Truman had won support for his foreign policy, but he was expected to lose the presidential election that year because of his poor domestic record. Polls showed him lagging behind Dewey, again the Republican nominee, and to make matters worse the Democratic Party splintered. Former vice president Henry A. Wallace headed the Progressive Party ticket, which pledged to improve Soviet-American relations whatever the cost. Southerners, known as Dixiecrats, who were alienated by the Democratic Party's strong civil rights plank, formed the States' Rights Democratic Party and nominated Governor Strom Thurmond of South Carolina for president. These defections appeared to ensure Truman's defeat. Instead Truman won handily, receiving almost as many votes as his opponents combined. His support came largely from labour, which was upset by the Republican passage of the Taft–Hartley Act, from blacks, who strongly supported the Democrats' civil rights provisions, and from farmers, who preferred the higher agricultural subsidies promised by the Democrats, especially at a time when commodity prices were falling.

The election of 1948

The Democrats regained control of Congress in 1948, but Truman's relations with that body continued to be troubled. In January 1949 he asked for a broad range of Fair Deal measures, with uneven results. Congress did approve a higher minimum wage, the extension of social security to 10,000,000 additional persons, more public works, larger sums for the TVA and for rural electrification, and the Housing Act of 1949, which authorized construction of 810,000 units for low-income families. Truman failed, however, to persuade Congress to repeal Taft–Hartley, to reform the agricultural subsidy system, to secure federal aid to education, to adopt his civil rights program, or, most importantly, to accept his proposal for national health insurance. He succeeded nevertheless in protecting the New Deal principle of federal responsibility for social welfare, and he helped form the Democratic agenda for the 1960s.

The Red Scare. Truman's last years in office were marred by charges that his administration was lax about, or even condoned, subversion and disloyalty and that communists, called "reds," had infiltrated the government. These accusations were made despite Truman's strongly anticommunist foreign policy and his creation, in 1947, of an elaborate Federal Employee Loyalty Program, which resulted in hundreds of federal workers being fired and in several thousand more being forced to resign.

Charges of communist subversion

The excessive fear of communist subversion was fed by numerous sources. China's fall to communism and the announcement of a Soviet atomic explosion in 1949 alarmed many, and fighting between communist and U.S.-supported factions in Korea heightened political emotions as well. Real cases of disloyalty and espionage also contributed, notably the theft of atomic secrets, for which Soviet agent Julius Rosenberg and his wife Ethel were convicted in 1951 and executed two years later. Republicans had much to gain from exploiting these and related issues.

Senator Joseph R. McCarthy of Wisconsin stood out among those who held that the Roosevelt and Truman administrations amounted to "20 years of treason." In February 1950 McCarthy claimed that he had a list (whose number varied) of State Department employees who were loyal only to the Soviet Union. McCarthy offered no evidence to support his charges and revealed only a single name, that of Owen Lattimore, who was not in the State Department and would never be convicted of a single offense. Nevertheless, McCarthy enjoyed a highly successful career, and won a large personal following, by making charges of disloyalty that, though mostly undocumented, badly hurt the Democrats. Many others promoted the scare in various ways, leading to few convictions but much loss of employment by government employees, teachers, scholars, and people in the mass media.

The Korean War. On June 25, 1950, a powerful invading force from the Soviet-supported Democratic People's Republic of Korea (North Korea) swept south of the 38th parallel into the Republic of Korea (South Korea). Within days, President Truman resolved to defend South Korea, even though there were few Americans in Korea and few troops ready for combat. The UN Security Council, acting

during a Soviet boycott, quickly passed a resolution calling upon UN members to resist North Korean aggression.

After almost being driven into the sea, UN forces, made up largely of U.S. troops and commanded by U.S. General Douglas MacArthur, counterattacked successfully and in September pushed the North Korean forces back across the border. Not content with this victory, the United States attempted to unify Korea by force, advancing almost to the borders of China and the Soviet Union. China, after its warnings were ignored, then entered the war, driving the UN forces back into South Korea. The battle line was soon stabilized along the 38th parallel, and armistice talks began on July 10, 1951, three months after Truman had relieved MacArthur for openly challenging U.S. policies. The talks dragged on fruitlessly, interrupted by outbreaks of fighting, until Eisenhower became president. The United States sustained some 142,000 casualties in this limited war, most of them occurring after China's entry.

In addition to militarizing the Cold War, the Korean conflict widened its field. The United States assumed responsibility for protecting Taiwan against invasion from mainland China. Additional military aid was extended to the French in Indochina. In December 1950 Truman called for a crash program of rearmament, not just to support the forces in Korea but especially to expand the U.S. presence in Europe. As a result defense expenditures rose to $53,600,000,000 in 1953, four times the pre-Korean level, and would decline only modestly after the armistice.

Peace, growth, and prosperity. The stalemated Korean War, a renewal of inflation, and the continuing Red Scare persuaded Truman not to stand for reelection in 1952 and also gravely handicapped Governor Adlai E. Stevenson of Illinois, the Democratic nominee. His opponent, General Dwight D. Eisenhower, was an immensely popular war hero with great personal charm and no political record, making him extremely hard to attack. Although he disliked their methods, Eisenhower allowed Republican campaigners, including his running mate, Senator Richard M. Nixon of California, to capitalize on the Red Scare by accusing the Truman administration of disloyalty. Eisenhower himself charged the administration with responsibility for the communist invasion of Korea and won wide acclaim when he dramatically promised that if elected he would visit Korea in person to end the war.

Eisenhower won over many farmers, ethnic whites, workers, and Roman Catholics who had previously voted Democratic. He defeated Stevenson by a large margin, carrying 39 states, including three in the once solidly Democratic South. Despite Eisenhower's overwhelming victory, Republicans gained control of the House by just eight votes and managed only a tie in the Senate. Because the Republican margin was so slight, and because many right-wing Republicans in Congress disagreed with his policies, Eisenhower would increasingly depend upon Democrats to realize his objectives.

Eisenhower had promised to end the Korean War, hold the line on government spending, balance the budget, abolish inflation, and reform the Republican Party. On July 27, 1953, an armistice was signed in Korea freezing the status quo. By cutting defense spending while taxes remained fairly high, and by keeping a tight rein on credit, Eisenhower was able to avoid serious deficits, abolish inflation, and, despite several small recessions, encourage steady economic growth that made Americans more prosperous than they had ever been before. Eisenhower also supported public works and a modest expansion of government social programs. In 1954 the St. Lawrence Seaway Development Corporation was established by Congress. In 1956 Congress authorized the National System of Interstate and Defense Highways, Eisenhower's pet project and the greatest public works program in history. Amendments to the Social Security Act in 1954 and 1956 extended benefits to millions not previously covered. Thus, Eisenhower achieved all but the last of his goals, and even in that he was at least partially successful. At first Eisenhower did little to check the Red Scare, but in 1954 Senator McCarthy unwisely began to investigate the administration and the U.S. Army. This led to a full-scale investigation of McCarthy's own activities, and on December 2 the

Senate, with Eisenhower playing a behind-the-scenes role, formally censured McCarthy for abusing his colleagues. McCarthy soon lost all influence, and his fall did much to remove the poison that had infected American politics. In short, Eisenhower was so successful in restoring tranquility that, by the end of his first term, some people were complaining that life had become too dull.

Tensions eased in foreign affairs as well. On March 5, 1953, Joseph Stalin died, opening the door to better relations with the Soviet Union. In 1955 the Soviets agreed to end the four-power occupation of Austria, and in that July Eisenhower met in Geneva with the new Soviet leader, Nikita S. Khrushchev, for talks that were friendly though inconclusive.

As for military policy, Eisenhower instituted the "New Look," which entailed reducing the army from 1,500,000 men in 1953 to 900,000 in 1960. The navy experienced smaller reductions, while air force expenditures rose. Eisenhower was primarily interested in deterring a nuclear attack and to that end promoted expensive developments in nuclear weaponry and long-range missiles.

Eisenhower's second term. Despite suffering a heart attack in 1955 and a case of ileitis that required surgery the next year, Eisenhower stood for reelection in 1956. His opponent was once again Stevenson. Two world crises dominated the campaign. On October 23, Hungarians revolted against communist rule, an uprising that was swiftly crushed by Red Army tanks. On October 29, Israel invaded Egypt, supported by British and French forces looking to regain control of the Suez Canal and, perhaps, to destroy Egypt's president, Gamal Abdel Nasser, who had nationalized the canal in July. Eisenhower handled both crises deftly, forcing the invaders to withdraw from Egypt and preventing events in Hungary from triggering a confrontation between the superpowers. Owing in part to these crises, Eisenhower carried all but seven states in the election. It was a purely personal victory, however, for the Democrats retained control of both houses of Congress.

Domestic issues. Although the Eisenhower administration can, in general, be characterized as a period of growth and prosperity, some problems did begin to arise during the second term. In 1957–58 an economic recession hit and unemployment rose to its highest level since 1941. Labour problems increased in intensity, with some 500,000 steelworkers going on strike for 116 days in 1959. There was even evidence of corruption on the Eisenhower staff. The president remained personally popular, but public discontent was demonstrated in the large majorities gained by the Democrats in the congressional elections of 1958.

Problems associated with postwar population trends also began to be recognized. The U.S. population, which had grown markedly throughout the 1950s, passed 179,000,000 in 1960. Growth was concentrated in the West, and the country became increasingly urbanized as the middle class moved from the cities to new suburban developments. The migration left cities without their tax base but with responsibility for an increasing number of poor residents. It also resulted in a huge increase in commuters, which in turn led to continuing problems of traffic and pollution.

During Eisenhower's second term, race became a central national concern for the first time since Reconstruction. Some civil rights advances had been made in previous years. In 1954 the Supreme Court had ruled that racially segregated schools were unconstitutional. The decision provoked intense resistance in the South but was followed by a chain of rulings and orders that continually narrowed the right to discriminate. In 1955 Martin Luther King, Jr., led a boycott of segregated buses in Montgomery, Ala., giving rise to the nonviolent Civil Rights movement. But neither the president nor Congress became involved in the race issue until 1957, when the segregationist governor of Arkansas blocked the integration of a high school in Little Rock. Eisenhower then sent federal troops to enforce the court's order for integration. Congress was similarly prompted to pass the first civil rights law in 82 years, the Civil Rights Act of 1960, which made a serious effort to protect black voters.

World affairs. On Oct. 4, 1957, the Soviet Union orbited the first artificial satellite, arousing fears that the

United States was falling behind the Soviets technologically. This prompted Eisenhower, who generally held the line on spending, to sign the National Defense Education Act of 1958, which provided extensive aid to schools and students in order to bring American education up to what were regarded as Soviet levels of achievement. The event also strengthened demands for the acceleration of the arms and space races, which eventually led to the U.S. Moon landing on July 20, 1969, and to a remarkable expansion of scientific knowledge. In 1958, threatened and actual conflicts between governments friendly to Western powers and unfriendly or communist forces in Lebanon, the islands of Quemoy and Matsu offshore of China, Berlin, and Cuba caused additional concern. Only a minority believed that the United States was still ahead in military and space technology, though in fact this was true.

The illness of Secretary of State John Foster Dulles in March 1959, and his subsequent resignation, led the president to increase his own activity in foreign affairs. He now traveled more and met more often with heads of state. The most important meeting was to be a summit in 1960 with Khrushchev and Western leaders to discuss such matters as Berlin, German reunification, and arms control. But two weeks before the scheduled date an American U-2 spy plane was shot down deep inside the Soviet Union. Wrangling over this incident destroyed both the Paris summit and any hopes of bettering U.S.-Soviet relations.

An assessment of the postwar era. Despite great differences in style and emphasis, the administrations of Truman and Eisenhower were notable for their continuity. Both were essentially periods of reconstruction. After 15 years of depression and war, people were not interested in social reform but in rebuilding and expanding the educational and transportation systems, achieving stable economic growth, and, in the case of the younger generation whose lives had been most disrupted by World War II, in marrying and having children. Thus, the postwar era was the age of the housing boom, the television boom, and the baby boom, of high birth and comparatively low divorce rates, of proliferating suburbs and a self-conscious emphasis upon family "togetherness." Though frustrating to social reformers, this was probably a necessary phase of development. Once the country had been physically rebuilt, the practical needs of a rapidly growing population had been met, and standards of living had risen, there would come another age of reform.

The arrival of this new age was indicated in 1960 by the comparative youth of the presidential candidates chosen by the two major parties. The Democratic nominee, Senator John F. Kennedy of Massachusetts, was 43; the Republican, Vice President Nixon, was 47. They both were ardent cold warriors and political moderates. Kennedy's relative inexperience and his religion (he was the first Roman Catholic presidential nominee since Al Smith) placed him at an initial disadvantage. But the favourable impression he created during a series of televised debates with Nixon and the support he received from blacks after he helped the imprisoned black leader Martin Luther King, Jr., enabled him to defeat Nixon in the most closely contested election of the century.   (E.E.R./W.L.O'N.)

The New Frontier. During the campaign Kennedy had stated that America was "on the edge of a New Frontier"; in his inaugural address he spoke of "a new generation of Americans"; and during his presidency he seemed to be taking government in a new direction, away from the easygoing Eisenhower style. His administration was headed by strong, dedicated personalities. The Kennedy staff was also predominantly young. Its energy and commitment revitalized the nation, but its competence was soon called into question.

In April 1961 Kennedy authorized a plan that had been initiated under Eisenhower for a covert invasion of Cuba to overthrow the newly installed, Soviet-supported Communist regime of Fidel Castro. The invasion was repulsed at the Bay of Pigs, embarrassing the administration and worsening relations between the United States and the Soviet Union. These deteriorated further at a private meeting between Kennedy and Khrushchev in June 1961 when the Soviet leader was perceived as attempting to bully his young American counterpart. Relations hit bottom in October 1962 when the Soviets secretly began to install long-range offensive missiles in Cuba, which threatened to tip the balance of nuclear power. Kennedy forced the removal of the missiles, gaining back the status he had lost at the Bay of Pigs and in his meeting with Khrushchev. Kennedy then began to work toward improving international relations, and in July 1963 he concluded a treaty with Britain and the Soviet Union banning atomic tests in the atmosphere and underwater. His program of aid to Latin America, the Alliance for Progress, raised inter-American relations to their highest level since the days of Franklin Roosevelt.

Kennedy's domestic policies were designed to stimulate international trade, reduce unemployment, provide medical care for the aged, reduce federal income taxes, and protect the civil rights of blacks. The latter issue, which had aroused national concern in 1962 when federal troops were employed to assure the admission of a Negro at the University of Mississippi, caused further concern in 1963, when similar action was taken at the University of Alabama and mass demonstrations were held in support of desegregation. Although the Democrats controlled both houses of Congress, the administration's proposals usually encountered strong opposition from a coalition of Republicans and Southern Democrats. With Congress' support, Kennedy was able to increase military spending substantially. This led to greater readiness but also to a significant rise in the number of long-range U.S. missiles, which prompted a similar Soviet response.

On Nov. 22, 1963, President Kennedy was assassinated in Dallas, Texas, most probably by a lone gunman, though conspiracy theories abounded. Vice President Lyndon B. Johnson took the oath of office immediately.

Johnson and the Great Society. Johnson's first job in office was to secure enactment of New Frontier bills that had been languishing in Congress. By far the most important of these was the Civil Rights Act of 1964, which Johnson pushed through despite a filibuster by Southern senators that lasted 57 days. The act provided machinery to secure equal access to accommodations, to prevent discrimination in employment by federal contractors, and to cut off funds to segregated school districts. It also authorized the Justice Department to take a more active role in civil rights cases. Johnson went beyond the New Frontier in 1964 by declaring war on poverty. His Economic Opportunity Act provided funds for vocational training, created a Job Corps to train youths in conservation camps and urban centres, encouraged community action programs, extended loans to small businessmen and farmers, and established a domestic peace corps, the counterpart of a popular foreign program created by President Kennedy.

Johnson provided dynamic and successful leadership at a time of national trauma, and in the election of 1964 he won a landslide victory over his Republican opponent, the conservative senator Barry Goldwater of Arizona. More importantly, the Democrats gained 38 seats in the House of Representatives that year, enough to override the conservative bloc and enact a body of liberal social legislation.

With this clear mandate, Johnson submitted the most sweeping legislative program to Congress since the New Deal. He outlined his plan for achieving a "Great Society" in his 1965 state-of-the-Union address, and over the next two years he persuaded Congress to approve most of his proposals. The Appalachian Regional Development Act provided aid for that economically depressed area. The Housing and Urban Development Act of 1965 established a Cabinet-level department to coordinate federal housing programs. Johnson's Medicare bill fulfilled President Truman's dream of providing health care for the aged. The Elementary and Secondary Education Act of 1965 provided federal funding for public and private education below the college level. The Higher Education Act of 1965 provided scholarships for more than 140,000 needy students and authorized a National Teachers Corps. The Immigration Act of 1965 abolished the discriminatory national-origins quota system. The minimum wage was

raised and its coverage extended in 1966. In 1967, social security pensions were raised and coverage expanded. The Demonstration Cities and Metropolitan Area Redevelopment Act of 1966 provided aid to cities rebuilding blighted areas. Other measures dealt with mass transit, truth in packaging and lending, beautification, conservation, water and air quality, safety, and support for the arts.

Race relations.   The civil rights revolution came to a head under the Johnson administration. Despite the Civil Rights Act of 1964, most Southern blacks found it difficult to exercise their voting rights. In 1965, mass demonstrations were held to protest the violence and other means used to prevent black voter registration. After a peaceful protest march at Selma, Ala., was violently broken up by white authorities, Johnson responded with the Voting Rights Act of 1965, which abolished literacy tests and other voter restrictions and authorized federal intervention against voter discrimination. The subsequent rise in black voter registration transformed politics in the South.

Despite these gains, many blacks remained dissatisfied by the slow progress. The nonviolent Civil Rights movement was challenged by "black power" advocates, who expelled or alienated whites and crippled the movement. Race riots broke out in most of the nation's large cities, notably in 1965 in the Watts district of Los Angeles, leaving 34 dead, and two years later in Newark and Detroit. Four summers of violence resulted in many deaths and property losses that left whole neighborhoods ruined and their residents more distressed than ever. After a final round provoked by the assassination of Martin Luther King, Jr., in April 1968, the rioting abated.

Social changes.   The 1960s were marked by the greatest changes in morals and manners since the 1920s. Young people, college students in particular, rebelled against what they viewed as the repressed, conformist society of their parents. They advocated a sexual revolution, aided by the birth control pill and later by *Roe v. Wade* (1973), a Supreme Court ruling that legalized abortion. "Recreational" drugs such as marijuana and LSD were increasingly used. Opposition to U.S. involvement in Vietnam promoted the rise of a New Left, which was anticapitalist as well as antiwar. A "counterculture" sprang up that legitimized radical standards of taste and behaviour in the arts as well as in life. Feminism was reborn and joined the ranks of radical causes.

Except for feminism, most organized expressions of the counterculture and the New Left did not long survive the sixties. Nevertheless they changed American life. Drug taking, previously confined largely to ghettos, became part of middle-class life. The sexual revolution reduced government censorship, changed attitudes toward traditional sexual roles, and enabled homosexuals to organize and acknowledge their identities as never before. Unrestrained individualism played havoc with family values. People began marrying later and having fewer children. The divorce rate accelerated to the point that the number of divorces per year was roughly half the number of marriages. The number of abortions rose, as did the illegitimacy rate. By the 1980s one in six families was headed by a single woman, and over half of all people living in poverty, including some 12,000,000 children, belonged to such families. Because inflation and recession made it hard to support even intact families on a single income, a majority of mothers entered the work force. Thus the stable, family-oriented society of the 1950s became a thing of the past.

The Vietnam War.   U.S. involvement in Vietnam dated to the Truman administration, when economic and military aid was provided to deter a communist takeover of French Indochina. When France withdrew and Vietnam was divided in two in 1954, the United States continued to support anticommunist forces in South Vietnam. By 1964, communist insurgents were winning their struggle against the government of South Vietnam, which a decade of American aid had failed to strengthen or reform. In August, following an allegedly unprovoked attack on U.S. warships patrolling the Gulf of Tonkin, a resolution pledging complete support for American action in Vietnam was passed unanimously in the House of Representatives and with only two dissenting votes in the Senate.

After the fall elections, Johnson began deploying a huge force in Vietnam (more than half a million troops in 1968, together with strong air and naval units). This power was directed not only against the Viet Cong insurgents but also against North Vietnam, which increased its efforts as American participation escalated. Despite massive U.S. bombing of North Vietnam, the communists refused to yield. On Jan. 30, 1968, disregarding a truce called for the Tet (lunar new year) holiday, the communists launched an offensive against every major urban area in South Vietnam. Although the Tet Offensive was a military failure, it proved to be a political victory for the communists because it persuaded many Americans that the war could not be ended at a bearable price. Opposition to U.S. involvement became the major issue of the 1968 election. After Senator Eugene McCarthy, a leading critic of the war, ran strongly against him in the New Hampshire primary, Johnson announced that he would not seek or accept renomination. He also curtailed bombing operations, opened peace talks with the North Vietnamese, and on November 1 ended the bombing of North Vietnam.

While war efforts were being reduced, violence within the United States seemed to be growing. Just two months after King's assassination, Senator Robert F. Kennedy, a leading contender for the Democratic presidential nomination, was assassinated. President Johnson then secured the nomination of Vice President Hubert H. Humphrey at the Democratic National Convention at Chicago, where violence again erupted as antiwar demonstrators were manhandled by local police. Humphrey lost the election to the Republican nominee, former vice president Richard Nixon. The narrowness of Nixon's margin resulted from a third-party campaign by the former governor of Alabama, George Wallace, who attracted conservative votes that would otherwise have gone to Nixon. Democrats retained large majorities in both houses of Congress.

The Richard M. Nixon administration.   *Foreign affairs.* Nixon and his national security adviser, Henry Kissinger, believed that American power relative to that of other nations had declined to the point where a fundamental reorientation was necessary. They sought improved relations with the Soviet Union to make possible reductions in military strength while at the same time enhancing American security. In 1969 the Nixon Doctrine called for allied nations, especially in Asia, to take more responsibility for their own defense. Nixon's policy of détente led to Strategic Arms Limitation Talks (SALT), which resulted in a treaty with the Soviet Union all but terminating antiballistic missile systems. In 1972 Nixon and Kissinger negotiated an Interim Agreement that limited the number of strategic offensive missiles each side could deploy in the future. Nixon also dramatically reversed Sino-American relations with a secret visit by Kissinger to Peking in July 1971. This led to a presidential visit the following year and to the establishment of strong ties between the two nations. Nixon then visited Moscow as well, showing that détente with the rival communist powers did not mean that he would play them off against one another.

The limits of détente were tested by the Arab-Israeli Yom Kippur War of October 1973, in which the United States supported Israel and the Soviet Union the Arabs. Nixon managed the crisis well, preventing the confrontation with the Soviets from getting out of hand and negotiating a cease-fire that made possible later improvements in Israeli-Egyptian relations. Nixon and Kissinger dramatically altered U.S. foreign relations, modifying containment, reducing the importance of alliances, and making the balance of power and the dual relationship with the Soviet Union and China keystones of national policy.

Meanwhile, inconclusive fighting continued in Vietnam, and unproductive peace talks continued in Paris. Although in 1969 Nixon announced his policy of "Vietnamization," according to which more and more of the fighting was to be assumed by South Vietnam itself, he began by expanding the fighting in Southeast Asia with a 1970 "incursion" into Cambodia. This incident aroused strong protest; student demonstrations at Kent State University in Ohio led on May 4 to a confrontation with troops of the Ohio National Guard, who fired on the students without orders,

The 1960s counter-culture

The Gulf of Tonkin resolution

Nixon's policy of détente

Antiwar demonstrations

killing four and wounding several others. National revulsion at this act led to serious disorders at many universities and forced some of them to close for the remainder of the term. Further antiwar demonstrations followed the 1971 U.S. invasion of Laos and Nixon's decision to resume intensive bombing of North Vietnam in 1972.

Peace negotiations with North Vietnam slowly progressed, and a cease-fire agreement was finally signed on Jan. 27, 1973. The agreement ended 12 years of U.S. military effort that had taken some 58,000 American lives.

Domestic affairs. When Chief Justice Earl Warren retired in 1969, Nixon replaced him with the conservative Warren Burger. Nixon appointed three other moderate or conservative justices. The Burger court did not reverse the policies of its predecessor.

Congress enacted Nixon's revenue-sharing program, which provided direct grants to state and local governments. Congress also expanded social security and federally subsidized housing. In 1972 the Congress, with the support of the president, adopted a proposed constitutional amendment guaranteeing equal rights for women. Despite widespread support, the Equal Rights Amendment, or ERA, as it was called, failed to secure ratification in a sufficient number of states.

The cost of living continued to rise, until by June 1970 it was 30 percent above the 1960 level; industrial production declined, as did the stock market. By mid-1971 unemployment reached a 10-year peak of 6 percent, and inflation continued. Wage and price controls were instituted, the dollar was devalued, and the limitation on the national debt was raised three times in 1972 alone. The U.S. trade deficit improved, but inflation remained unchecked.

The Watergate scandal. In June 1972 five men were arrested for breaking into the Democratic national headquarters at the Watergate office-apartment building in Washington. When it was learned that the burglars had been hired by the Committee to Re-Elect the President (CRP), John Mitchell, a former U.S. attorney general, resigned as director of CRP. These events, however, had no effect on the election that fall. Even though the Democrats retained majorities in both the Senate and the House, Nixon won a landslide victory over Democratic nominee Senator George McGovern of South Dakota.

In 1973, however, it was revealed that an attempt to suppress knowledge of the connection between the Watergate affair and CRP involved highly placed members of the White House staff. The Senate opened hearings in May, and Nixon appointed Archibald Cox as a special prosecutor to investigate the scandal. Amid conflicting testimony, almost daily disclosures of further scandals, and continuing resignations of administrative personnel, a battle developed between the legislative and executive branches. Nixon attempted to stop the investigation by firing Cox, leading Attorney General Elliot Richardson and Deputy Attorney General William D. Ruckelshaus to resign. This "Saturday night massacre" of Justice Department officials did not, however, stem the flow of damaging revelations, confessions, and indictments.

The Watergate affair itself was further complicated by the revelation of other irregularities. It became known that a security unit in the White House had engaged in illegal activities under the cloak of national security. Nixon's personal finances were questioned, and Vice President Spiro T. Agnew resigned after pleading no contest to charges of income tax evasion. On Dec. 6, 1973, Nixon's nominee, Congressman Gerald R. Ford of Michigan, was approved by Congress as the new vice president.

On May 9, 1974, the Judiciary Committee of the House of Representatives began hearing evidence relating to a possible impeachment proceeding. On July 27–30 it voted to recommend that Nixon be impeached on three charges. On August 5 Nixon obeyed a Supreme Court order to release transcripts of three tape-recorded conversations, and he admitted that, as evidenced in the recordings, he had taken steps to direct the Federal Bureau of Investigation away from the White House when its inquiries into the Watergate burglary were leading it toward his staff.

It seemed probable that he would be impeached. On the evening of August 8, in a television address, Nixon announced his resignation, effective the next day. At noon on August 9, Vice President Ford was sworn in as his successor, the first president not elected either to the office or to the vice presidency.

The Gerald R. Ford administration. Ford's was essentially a caretaker government. He had no mandate and no broad political base, his party was tainted by Watergate, and he angered many when he granted Nixon an unconditional pardon on Sept. 8, 1974. Ford's principal concern was the economy, which had begun to show signs of weakness. A brief Arab oil embargo during the Yom Kippur War had led to a quadrupling of oil prices, and the oil shock produced both galloping inflation and a recession. Ford was no more able than Nixon to deal with the combination of inflation and recession, called "stagflation," and Congress had no remedies either. For the most part Congress and the president were at odds. Ford vetoed no fewer than 50 bills during his short term in office.

In 1976 Ford won the nomination of his party, fighting off a strong challenge by Ronald Reagan, the former governor of California. In a crowded field of contenders, the little-known ex-governor of Georgia, Jimmy Carter, won the Democratic nomination by making a virtue of his inexperience. Ford nearly won the election, Carter receiving the smallest electoral margin since 1916.

The Jimmy Carter administration. *Foreign affairs.* More than any other president, Carter used diplomacy to promote human rights. Efforts to continue the détente with the U.S.S.R. foundered as the Soviets supported revolutions in Africa, deployed medium-range nuclear weapons in Europe, and occupied Afghanistan. Relations with the People's Republic of China, on the other hand, improved, and full diplomatic recognition of the Communist government took effect on Jan. 1, 1979. In September 1977 the United States and Panama signed two treaties giving control of the Panama Canal to Panama in the year 2000 and providing for the neutrality of the waterway.

In September 1978 Carter met with Egyptian president Anwar el-Sādāt and Israeli prime minister Menachem Begin at a two-week negotiating session at Camp David, Md., and on September 17 Carter announced that two accords had been signed establishing the terms for a peace treaty between Egypt and Israel. Further torturous negotiations followed before the peace treaty was signed in Washington, D.C., on March 26, 1979.

Carter's greatest defeat was administered by Iran. Following the overthrow of Mohammad Reza Shah Pahlavi, who had been supported by the United States, the Islāmic Republic of Iran was proclaimed in Iran on Feb. 1, 1979, under the leadership of Ayatollah Ruhollah Khomeini. In November militants seized the U.S. embassy in Tehrān and held its occupants hostage. An attempt to rescue the hostages in April 1980 failed, and the hostages were not released until Carter left office in January 1981. Carter's inability to either resolve the hostage crisis or to manage American perceptions of it disabled him as a leader.

Domestic policy. Carter was ineffective in domestic affairs. He failed to establish good relations with Congress, frequently changed course, and was unable to inspire public confidence. In 1979 Carter's appointee as chairman of the Federal Reserve Board, Paul Volcker, raised interest rates to unprecedented levels, which resulted in a severe recession. In 1980 Republican Ronald Reagan easily defeated Carter, and the Republicans gained control of the Senate for the first time since 1954.   (W.L.O'N.)

The Ronald Reagan administration. Reagan pledged to reduce government and to rejuvenate the economy. His program, which was based on the theory that tax cuts would stimulate so much growth that tax revenues would rise, called for reducing income taxes by 25 percent over a three-year period, cutting federal spending on social programs, and accelerating a military buildup. After Congress approved the program in May 1981, the recession deepened, but by 1984 the U.S. economy was recovering.

In foreign affairs, Reagan's attempt to unseat the leftist Sandinista regime in Nicaragua through aid to the Contras, a rebel force, was unpopular and unsuccessful. U.S.-Soviet relations were tense. Reagan's dispatch of U.S. marines to Lebanon in support of a cease-fire was followed by a ter-

Margin notes:

Nixon's resignation

The Iran hostage crisis

Reagan's economic reforms

rorist attack in which some 260 marines were killed. He launched a successful invasion of Grenada, where Cuban influence was allegedly growing. Relations with China initially worsened but began to improve in 1984.

In 1984 Reagan easily defeated Democrat Walter Mondale, Carter's vice president, 59 percent to 41 percent. In his second term, Reagan negotiated a treaty with the Soviet Union that eliminated two classes of weapon systems that each country had deployed in Europe—the first arms-limitation agreement to result in the destruction of existing weapons. Relations between the superpowers improved radically by 1988, owing primarily to the new Soviet premier, Mikhail Gorbachev, whose domestic reforms were matched by changes in foreign policy.

Reagan's popularity dipped briefly in 1987 after it was revealed that his administration had secretly sold arms to Iran in exchange for American hostages and had illegally used the profits to subsidize the Contras. Inflation and unemployment remained low, and economic growth continued. While domestic spending fell, military spending continued to rise, and revenues did not increase as had been predicted. The result was a staggering budget deficit and a growing national debt. Nonetheless, in 1988 Reagan's vice president, George Bush, handily defeated the Democratic nominee, Massachusetts governor Michael Dukakis.

The George Bush administration. Bush continued Reagan's foreign policies, especially by retaining cordial relations with the Soviet Union and its successor states. In December 1989 Bush ordered U.S. troops to seize control of Panama and arrest its ruler, General Manuel Noriega, who faced U.S. drug trafficking and racketeering charges.

Bush's skills were severely tested by the Iraqi invasion of Kuwait in August 1990. At risk was not only the sovereignty of Kuwait but also U.S. interests in the Persian Gulf, especially access to the region's vast oil supplies. Bush quickly organized a multinational coalition. Under the auspices of the United Nations, some 500,000 U.S. troops were brought together with other coalition forces in Saudi Arabia. Lasting from January 16 to February 28, the war was easily won; allied material and human costs were only slight, though thousands of Iraqi soldiers were killed and Iraq's military and civilian infrastructure was devastated. In 1991 the Soviet Union collapsed, leaving the United States as the world's only military superpower.

Although popular, the war stimulated a recession that ruined Bush's approval rating. The immense national debt ruled out large federal expenditures, the usual cure for recessions. The modest bills Bush supported failed in the Democratic-controlled Congress. Apart from a budget agreement with Congress in 1990—which broke Bush's pledge not to raise taxes—little was done to control the annual deficits, made worse by the recession.

In the 1992 election, the Democratic nominee, Arkansas Governor Bill Clinton, defeated Bush in a race in which independent Ross Perot won 19 percent of the popular vote—more than any third-party candidate since Theodore Roosevelt in 1912.

The Bill Clinton administration. Clinton began his first term hampered by a sluggish economy and rising healthcare costs. He sought to institute universal health insurance, but the proposals drafted by his task force (led by his wife, Hillary Clinton, later a U.S. Senator), did not reach Congress.

Clinton successfully lobbied for the passage of the North American Free Trade Agreement, which created a free-trade zone with Canada and Mexico, and he signed a deficit-reduction package to decrease the national debt. Clinton also signed some 30 major bills on women's and family issues.

In the 1994 elections the opposition Republican Party won a majority in both houses of Congress for the first time in 40 years. Clinton accommodated some Republican proposals—offering a more aggressive deficit-reduction plan and a massive overhaul of the nation's welfare system—but opposed Republican efforts to cut spending on popular programs such as Medicare. After a budget impasse and government shutdowns in 1995–96, Clinton won considerable public support for his more moderate approach.

In foreign policy, Clinton successfully reinstated Haitian President Jean-Bertrand Aristide, who had been ousted by

a military coup in 1991; committed U.S. forces to a peace-keeping initiative in Bosnia and Herzegovina; and played a leading role in attempts to negotiate peace agreements in the Middle East and Northern Ireland.

The economy began to recover, and, buoyed by economic growth, Clinton was reelected in 1996, capturing 49 percent of the popular vote to 41 percent for Republican challenger Bob Dole and 8 percent for Perot. Economic growth continued during Clinton's second term. By 1998 the Clinton administration oversaw the first balanced budget and budget surpluses since 1969. But during much of Clinton's term, an independent counsel, Kenneth Starr, investigated various allegations against him. Starr eventually uncovered evidence of an affair between Clinton and a White House intern, Monica Lewinsky. The House of Representatives impeached Clinton in 1998 on charges of perjury and obstruction of justice, but he was acquitted by the Senate.

The 2000 presidential election between Clinton's vice president, Al Gore, and George W. Bush, the governor of Texas, was one of the country's closest and most controversial. Although Gore won the nationwide popular vote, the presidency hinged on the outcome in Florida, whose 25 electoral votes would give the winner of that state a narrow majority in the electoral college. Bush led in Florida by fewer than 1,000 votes after a mandatory statewide recount, but the election remained undecided for five weeks as Florida state courts and federal courts heard numerous legal challenges. Eventually the U.S. Supreme Court decided (5 to 4) to stop the statewide manual recount ordered by the Florida Supreme Court, thus enabling Bush to win the electoral college vote 271 to 266.   (W.L.O'N./Ed.)

The George W. Bush administration. Bush became the first Republican president since the 1950s to enjoy a majority in both houses of Congress. Despite having campaigned as a new type of "compassionate conservative," Bush promoted traditionally conservative policies in domestic affairs, including a $1.35 trillion tax-cut bill he signed into law in June 2001. In foreign affairs, the administration faced worldwide criticism for its abandonment of the 1997 Kyoto Protocol, a treaty aimed at reducing the emission of greenhouse gases; its withdrawal from the 1972 Treaty on Antiballistic Missiles; and its refusal to become a party to the new International Criminal Court.

The September 11 attacks in 2001 that resulted in the deaths of some 3,000 people were seen as a watershed moment in U.S. history. Those responsible for the attacks included Osama bin Laden, the exiled Saudi and radical Islāmist who masterminded the attack, and his al-Qaeda terrorist network, which thrived under the Taliban regime in Afghanistan. Declaring a "war on terror," the United States toppled the Taliban in Afghanistan by year's end. The September 11 attacks also led the Bush administration to introduce a sweeping domestic policy initiative that included the controversial Patriot Act (which some observers criticized as an impingement on personal liberties) and the creation of the Department of Homeland Security. Meanwhile, armed with what was later acknowledged as faulty intelligence, Bush portrayed Iraqi leader Saddam Hussein as an imminent threat to national security and in 2003 invaded Iraq and deposed Hussein. Domestically, the Republican majority in Congress enacted further tax cuts.

Following a contentious reelection campaign, Bush narrowly defeated his Democratic challenger, Senator John Kerry. In his second term, Bush failed to gain approval for initiatives to overhaul Social Security but did win confirmation of two Supreme Court nominees. His approval ratings fell in 2005 owing largely to what was widely seen as an inadequate federal response to the devastation wrought in several Gulf Coast states by Hurricane Katrina and to growing antipathy toward his handling of the Second Persian Gulf War and the increasingly costly reconstruction in Iraq. By mid-decade, the U.S. economy began to rebound, even as the trade deficit rose to unprecedented levels.

The First Persian Gulf War

The September 11 attacks

NEW ENGLAND

Connecticut

One of the original 13 states and one of the six New England states, Connecticut is located in the northeastern corner of the United States. In area it is the third smallest state in the nation, with 5,018 square miles (12,997 square kilometres), and it ranks among the most densely populated. It lies athwart the great urban-industrial complex along the Atlantic coast, with Massachusetts on the north, Rhode Island on the east, Long Island Sound (an arm of the Atlantic Ocean) on the south, and New York on the west. Hartford is the capital. Connecticut takes its name from an Algonquian word meaning "land on the long tidal river."

Connecticut, with its many beaches and harbours, its forest-clad hills, and its village greens that are often surrounded by houses dating from the 17th and 18th centuries, represents a special blend of modern urban life, rustic landscape, and historic sites. It is a highly industrial and service-oriented state, and its personal income per capita is among the highest in the nation. The strength of its economy lies in a skilled working force, much of it fabricating products that have been manufactured in Connecticut since the products were invented.

The population is heavily urban. The state has no single large city, however, and the intense crowding characteristic of many urban areas is not found in Connecticut. It continues its long tradition of being a prosperous state, with in-migration attracted by the good employment opportunities, excellent educational facilities, and pleasant living conditions for the majority of its people.

PHYSICAL AND HUMAN GEOGRAPHY

The land. *Relief.* Essentially a rectangle in shape, 90 miles (145 kilometres) west to east and an average of 55 miles north to south, Connecticut covers the southern portion of the New England section of the Appalachian Mountain system. It contains three major regions: the Western Upland, the Central Lowland (Connecticut Valley), and the Eastern Upland. The northern part of the Western Upland, often called the Berkshire Hills, contains the highest elevation in the state, 2,380 feet (725 metres), on the southern slope of Mount Frissell in the northwest corner. It is drained by one major river, the Housatonic, and numerous tributaries.

The Central Lowland is different in character, being a downfaulted block of land approximately 20 miles wide at the Massachusetts border and narrowing as it progresses toward the sea, which it meets at New Haven. It is filled with sandstone and shale. Periodic volcanic activity pushed immense quantities of molten rock to the surface and produced the igneous deposits of the central valley. These layers of sandstones and traprock have been faulted, broken, and tipped so that there are numerous small ridges, some reaching as high as 1,000 feet above their valleys. Within the lowland, the Connecticut and other rivers have eroded the soft sandstones into broad valleys.

The Eastern Upland resembles the Western in being a hilly region drained by numerous rivers. Their valleys come together to form the Thames River, which reaches Long Island Sound at New London. Elevations in this area rarely reach above 1,300 feet. In both uplands the hilltops tend to be level and have been cleared for agriculture.

Climate. In Connecticut's moderate climate, the average January temperature is around 26° F (−3° C), and most of the state receives from 35 to 45 inches (889 to 1,143 millimetres) of snow each year. In the northwest, however, the average snowfall exceeds 75 inches. Snow may remain on the ground until March, but usually mild spells and rains melt it earlier in the year. Summers average between 70° and 75° F (21° to 24° C), with occasional heat waves driving the daytime temperatures above 90° F (32° C). Precipitation, averaging from three to four inches per month, is evenly distributed. The coastal portions have somewhat warmer winters and cooler summers than

does the interior, while the northwestern uplands are high enough to have cooler and longer winters with heavier falls of snow. Occasionally, hurricanes have caused flooding and other damage, particularly along the coastline. Tornadoes and severe thunderstorms sometimes occur in the Connecticut River valley.

Perhaps the most marked characteristic of Connecticut's weather is its changeability. Cold waves and heat waves, storms and fine weather can alternate with each other weekly or even daily. The statement of Hartford resident Mark Twain, "If you don't like Connecticut weather, wait a minute," has become a widely appropriated and adapted proposition.

Plant and animal life. Originally, Connecticut was a forested region. The few Indian clearings, the swampy floodplains, and the tidal marshes accounted for about 5 percent of the total area. The southern two-thirds is largely an oak forest. The northern border belongs to the northern hardwood region of birch, beech, maple, and hemlock. A few higher elevations and some sandy sections support a coniferous forest. Virtually all of the primeval forest has been cut, and the current woodland that covers nearly two-thirds of the state is a mixed forest.

The animal life when the first European settlers arrived included deer, bear, wolves, foxes, and numerous smaller species, such as raccoon, muskrat, porcupines, weasels, and beaver. Deer are still found in the less densely settled regions, but in general the populations of larger animals have been severely reduced. Most birds are migratory, but chickadees, blue jays, and the immigrant English sparrows are year-round residents.

Settlement patterns. Most regions in Connecticut are not clearly defined, although Fairfield county in the southwest section is uniquely oriented toward New York City, serving as a suburb for many commuters. With two of the state's largest cities, Stamford and Bridgeport, Fairfield is one of the most populous counties in the state. The northwestern and northeastern quarters of Connecticut are less densely populated. They have some agriculture, but most residents there, as elsewhere in the state, work in the manufacturing cities and towns along the rivers.

Connecticut's small towns represent a territorial concept that is equivalent to a township in other parts of the country. Within each town, a town centre is surrounded by the town hall, schools, churches, usually a village green, a number of houses, and often a tiny business district with several stores. Elsewhere within the town, other hamlets may contain similar communal gatherings. If the hamlet is on a stream, the houses often cluster around a red brick factory that was erected in the 19th century to run its machinery from a waterwheel in the river. Such mill villages are to be found throughout the state, although many of the factories have been abandoned. Farmsteads and cultivated fields once lay between such small population nodes, but the roads connecting these villages have become sparsely lined with rural, nonfarm homes.

City status in Connecticut is determined not by population but by vote of the residents to change their governmental system from a town meeting to a city form. All of the larger towns and cities are manufacturing centres; some originated as mill towns and grew with their factories. The power source changed from water to steam and later to electricity, and often the products manufactured have changed to satisfy a new economic and social structure, but each city and town prides itself on the uniqueness that often is associated with its products.

The people. *Ethnic composition.* The Algonquian Indians, the original occupants of Connecticut, comprised about 16 separate tribes with some 5,000 to 7,000 members. The first European settlers were English, coming directly from England or by way of the Massachusetts Bay colony. During the 17th and 18th centuries population growth occurred primarily through an excess of births over deaths; immigrants, mainly from the British Isles, arrived at a rather slow rate. At the time of the first U.S. census, in

Margin notes:

Physiographic regions

Rural and urban settlement

Church in Litchfield, Conn.
D Forbert/Shostal Associates

1790, Connecticut had a homogeneous population, about 96 percent of which was of English ancestry; blacks accounted for only about 2 percent of the population.

The immigration of the Irish, beginning in the 1840s, and of French Canadians after the Civil War, continued throughout the 19th century. Later in the 19th century the primary sources of foreign immigration shifted to southern and eastern Europe—Italy, Poland, the Austro-Hungarian Empire, and Russia. Each immigrant group tended to congregate in certain parts of the state. Thus New Haven and its suburbs are populated with large numbers of descendants of Italian immigrants; Poles are concentrated in the Naugatuck valley; and French Canadians live in the northeast. The immigration of blacks into Connecticut after World War II showed the same tendency. Most blacks live in the five largest cities. New Haven and Hartford are more than 30 percent black. Puerto Ricans have moved from their island and from New York City into Connecticut's urban centres. Hartford has a large concentration of Jamaicans. Other West Indies islands are also well represented in the major cities.

Demographic trends. From 1790 to 1840 the state's growth rate hovered between 4 and 8 percent per decade. Connecticut was—considering its small size and its limited agricultural resources—quite adequately filled. During the 19th century thousands of Connecticut residents, especially the young, migrated to better agricultural lands in the western part of the country; their places were taken by newcomers from Europe. The state's population growth passed the national rate in 1900 and, with one exception, did not fall below it until 1980.

For more than 300 years the distribution of Connecticut's people has reflected the region's changing economy and the resources of the land. Settlement began in the middle Connecticut Valley, where the soils were good, and on the coast, where maritime activities, trading, and fishing supplemented the living that the settlers were able to derive from the land. The upland areas were not fully occupied until the late 18th century, yet by 1790 the population was fairly evenly distributed across the state. Towns with better agricultural lands or with other resources—marine or mineral—had denser populations. During the 19th century the rise of water-powered manufacturing attracted young people from the agricultural upland towns to the growing mill towns, and virtually all of the upland towns lost population. Manufacturing towns grew rapidly.

The movement of people and industry into the cities dominated the population movements until 1950. Since then, Bridgeport, Hartford, and New Haven, the three largest cities, have had a general movement of population to the suburbs and to the former agricultural hill towns.

The economy. With limited natural resources, a well-educated and innovative citizenry has enabled Connecticut to reach high levels of productivity. Connecticut's creative genius has produced large shares of significant inventions and patents.

Connecticut, like other areas of the Northeast, lost much traditional industry to the Sunbelt in the 1940s and '50s, but the '70s and '80s were marked by economic rebound. In the 1980s Connecticut ranked first in personal income per capita and had one of the lowest unemployment rates in the nation. Labour unions have been strong and may be given partial credit for the high wages and good working conditions characteristic of most Connecticut factories. Business is also a powerful force in the state. The Connecticut Business and Industry Association is sophisticated and influential, and there are many active local chambers of commerce.

Agriculture and fishing. Since 1870, agriculture has declined in importance, and it is now a relatively minor element in the economy. The precipitous decline in the number of farms resulted in the enactment in 1978 of a farmland preservation program. Livestock and animal products are the major source of farm income. Connecticut's farms produce substantial quantities of milk, eggs, poultry, and vegetables for local consumption and one important export crop, shade-grown tobacco, used mainly for cigar wrappers.

Except for the oyster industry and the historically important whaling industry, commercial fishing has never been very important in the state. The oyster industry has attempted a comeback from the devastation caused by natural elements and pollution of the coastal waters.

Industry. The foundation of Connecticut's economy is manufacturing, which employs about one-fourth of the state's work force. High-technology companies, small development firms, and service industries have all shown growth since the 1970s. Defense contracts play a vital role in Connecticut's manufacturing. In addition to military products, thousands of items that are sold on a worldwide basis are produced in the state. Among the items that have been manufactured in Connecticut by long tradition are pins, clocks, silverware, sewing machines, Winchester rifles, and many brass products.

Historically, mining was important; but the last iron and copper mines closed long ago, and the state's high ranking in value added by manufacture is due mainly to the import of nearly all raw materials. Only sand, gravel, stone, feldspar, clay, and mica are still produced within the state. A large number of minerals were first discovered in Connecticut by Yale University mineralogists, and many quarries still yield interesting finds to collectors.

Connecticut is often referred to as the nation's insurance centre and Hartford as The Insurance City. Marine insurance was the first concern of Connecticut companies, and eventually the coverages that they offered expanded to many forms of casualty insurance. Some of the largest insurance companies of the United States are based in Connecticut.

Transportation. Connecticut's railroad network is a basic link in the Boston–New York City transportation pattern. The first railroads were constructed to bring the produce of the agricultural interior to Connecticut ports. Each of the larger river valleys—the Housatonic, Naugatuck, Connecticut, Willimantic, and Quinebaug—supported its own railroad. The line along the coast was completed in 1852. Until 1930 the railroads flourished with the expanding Connecticut economy, but highway competition for passengers and products reduced railroad traffic severely. Most of the river lines have dropped passenger service; freight service continues on some, but on others it has been abandoned. Amtrak operates two passenger lines through Connecticut: the New York-to-Boston route and the route from New York to Springfield, Mass. Service on the New York–New Haven line has deteriorated despite

(margin notes)

Patterns of immigration

An economic overview

The insurance industry

its heavy use as a commuter facility between southern Connecticut and New York City. Rehabilitation began in the early 1980s.

Interstate highways crisscross the state, but they are concentrated in the densely settled coastal and Connecticut Valley regions. Connecticut pioneered in the limited-access highway. The first section of the Merritt Parkway, from New York to near Milford, opened in 1938 and is often acclaimed as one of the most scenic and best designed. On June 28, 1983, several lives were lost with the collapse of the Mianus River bridge. The governor and legislature responded with the nation's first comprehensive infrastructure renewal program for roads and bridges.

Bradley International Airport, north of Hartford, is the major air terminal, but there are many other airports throughout the state that offer regional services. The port of New Haven is one of the largest in New England, and the U.S. Coast Guard Academy facilities are at New London.

Administration and social conditions. *Government.* Connecticut has enjoyed 350 years of constitutional government, from the Fundamental Orders of 1638 to the present constitution of 1965. Connecticut's state government is headed by a strong governor who is elected for a four-year term. The governor initiates legislation, prepares the state budget, appoints department heads, and can veto individual items of an appropriation bill. An Office of Policy and Management develops the governor's proposed budget and oversees executive agencies. Major oversight is also provided by an independent, bipartisan auditors' office.

Executive branch

Connecticut's legislative branch, the General Assembly, is composed of a 151-member House and a 36-member Senate. It met biennially until a constitutional amendment adopted in 1970 provided for annual legislative sessions. The 36 senatorial districts are approximately equal in population. The House of Representatives was originally based on towns, with each town, regardless of size, having at least one representative. The 1965 constitution reapportioned the lower branch so that it, like the Senate, is based on equivalent population. Connecticut's General Assembly is different from most state legislatures in that all business is conducted through joint House–Senate standing committees. Although the legislature is in session for only three to five months each year, there is interim committee activity. Major legislative issues include the budget, education, solid-waste disposal, drugs, local aid and property tax relief, crime, and housing.

The state's judiciary is headed by the Supreme Court. Superior courts were formed in 1978 by a merger of the courts of common pleas and the juvenile courts. The justices of the Supreme Court and of the superior courts are nominated by the governor and appointed by the General Assembly for eight-year terms. Probate judges are elected on partisan ballots for four-year terms.

Below the state government are 169 local units called towns. They are creations of the state, with their rights and responsibilities set out in state statutes. There is, nonetheless, a long-standing, intense tradition of local autonomy. These local governments maintain roads and provide elementary and secondary education and police and fire protection. Larger municipalities also provide water and sewage facilities and other services. Originally, government was based on the town meeting, at which the citizens elected selectmen to run the town between the annual meetings. As populations increased and problems of administration became more complex, other systems were substituted. Most larger communities have opted for a city form with an elected mayor and council. Some smaller communities have elected mayors; some have town or city managers. Many towns have retained the town meeting or have substituted the representative town meeting.

The state government provides funds to local governments for the many social programs that are operated. Although Connecticut has no broad-based income tax, it does tax interest, dividends, and capital gains above certain income levels. State government relies heavily on high sales and business taxes for revenue. Local governments are almost entirely reliant on property taxes, supplemented by state and federal aid.

Education. From the earliest days, every town has been required to maintain public elementary schools and, as the town grew in size, secondary schools as well. Connecticut is renowned for its many private schools and colleges. Yale University (1701), in New Haven, is regarded as one of the world's great universities; other institutions, such as Wesleyan University (1831) in Middletown, have national recognition. Public higher education has expanded considerably. The community college system, founded in 1965, has more than 10 colleges. Also under the aegis of the State Board of Governors for Higher Education are the University of Connecticut (1881) at Storrs, with several branches, four other state universities, and five technical colleges.

Major universities

Health and welfare. The community and the state have become increasingly involved in health and medical care. Most people live within 10 miles of hospital services, and doctors and other medical personnel are numerous. There are many community health clinics in addition to the advanced medical centres of the University of Connecticut at Farmington and of the Yale–New Haven Hospital. A Health Care Cost Commission has endeavoured to control rapidly spiraling cost increases. In relation to most states, Connecticut provides generous welfare benefits. Departments for the aged and for children and youth services have been established to meet the special needs of communities.

Despite inner-city blight and abandoned housing, progress has been made by urban redevelopment programs in Connecticut's larger cities. Urban renewal programs in New Haven during the 1950s and '60s became a prototype for the nation. Much work in rehabilitating urban areas remains to be done, however, especially in residential neighbourhoods. There is also a shortage of lower- and middle-income housing.

To correct abuses in the free enterprise system, Connecticut enacted numerous regulations. The first child-labour law was passed in 1842, but it was ineffectual: for 30 years more, hundreds of children continued to work long hours in the textile mills. A labour department was set up by the state in 1873, and since then hundreds of laws and regulations have been enacted to control working conditions. The length of the working day, minimum wage rates, equal pay for equal work, and similar protective regulations have been passed. State departments supervise banks, insurance companies, and the public utilities, and in 1959 the Department of Consumer Protection was organized to consolidate several existing agencies.

Labour legislation

Cultural life. Connecticut provides a variety of landscapes: rocky headlands, beaches, forested hills, and, perhaps most attractive, small towns around tree-dotted village greens. In the towns, hundreds of houses dating from the 17th and 18th centuries are preserved by more than 100 local or national historical societies.

Numerous sites important in Connecticut's past or associated with illustrious individuals are maintained by state or private organizations. These include the Putnam Wolf Den in Pomfret, Mount Riga Furnace in Salisbury, Fort Griswold State Park in Groton, Old New-Gate Prison and Copper Mine in East Granby, the Mark Twain Memorial home in Hartford, the Tapping Reeve House and Law School in Litchfield, and the (William) Gillette Castle State Park in East Haddam. Perhaps the best known is Mystic Seaport and Marine Museum in Mystic, where a small New England seaport has been recreated with all its ships and shops. The outdoorsman can tramp the many miles of trails and camp in one of the 30 state forests, covering more than 130,000 acres (52,500 hectares), or in one of 90 state parks, comprising some 30,000 acres (12,000 hectares). Colourful autumn foliage impresses many visitors to Connecticut and the rest of New England. Sport fishing, particularly for bluefish, is popular in Long Island Sound.

Art exhibitions are held annually in many cities, a number of which have art galleries and museums. The best known are the Yale University Art Gallery, the Wadsworth Atheneum in Hartford, and the New Britain Museum of American Art. Symphony concerts and concerts by smaller groups are presented regularly in the larger communi-

Theatre companies

ties. Several educational institutions have public concerts throughout the year. Repertory companies operating in or near resort areas in the summer include the Westport County Playhouse in Westport and the Oakdale Musical Theatre in Wallingford. The American Shakespeare Theatre in Stratford, the Long Wharf Theatre in New Haven, and the Goodspeed Opera House in East Haddam are well known. The Yale School of Drama was, at its founding in 1925, the first such school at an institution of higher learning. Southwestern Connecticut is also within easy reach of the vast artistic resources of New York City.

HISTORY

Colonization. In contrast to many of the other New England areas, relations between Indians and the early settlers in Connecticut were good. Trading posts were established along the Connecticut River by the Dutch from New Amsterdam and by the English from the Plymouth colony, but the first permanent European settlers in the state came from the Massachusetts Bay colony to the middle Connecticut Valley during 1633–35 and to the Saybrook–New Haven coastal strip during 1635–38. In 1665 the Connecticut River settlements and the New Haven colony were united, and the general outline of the state emerged, although its borders were not finally demarcated until 1881, more than 200 years later. The New Haven colony was unsuccessful in an attempt to settle Delaware Bay, and the united Connecticut colony, despite its charter provisions, lost its claim to a strip of land extending to the Pacific. Following the American Revolution, settlers from Connecticut, with claims in the Midwest, were among the first to move into an area that became known as the Western Reserve, now northeastern Ohio.

Political, economic, and social maturation. The political development of the colony began with the Fundamental Orders of Connecticut (1638), a civil covenant by the settlers establishing the system by which the river towns of Windsor, Hartford, and Wethersfield agreed to govern themselves. The orders created an annual assembly of legislators and provided for the election of a governor. This was superseded by the royal charter of 1662, a liberal document that provided for virtual self-government by the propertied men of orthodox faith in the colony. It served Connecticut well until it was replaced by the state constitution adopted in 1818, a document that after being amended many times was replaced by a new constitution in 1965, reflecting the more complex needs of contemporary government. The Congregational church was disestablished by the constitution of 1818.

Connecticut remained an agricultural region of farms with a few small urban areas—Hartford, New Haven, New London, and Middletown—until the early 19th century. The economy began to change, however, after 1800, when textile factories were established, and, by 1850, employees in manufacturing outnumbered those in agriculture. The shift to manufacturing had been aided by the inventive genius of a number of Connecticut residents. Eli Whitney, well known for his invention of the cotton gin in 1794, developed the idea of machine-made parts for guns. An order for muskets from the federal government enabled him to build a musket factory in Hamden. The principle of interchangeable parts, adapted to clock manufacturing by Eli Terry of Plymouth in 1802, rapidly became basic to all manufacturing.

The economic, social, and political innovations that emerged in the 19th and 20th centuries were often resisted at first, but eventually they were accepted. Slavery, first attacked by legislation in 1784, was not abolished completely until 1848. The constitution of 1818 granted suffrage to men with certain property qualifications, but women's suffrage came only through federal enactment in 1920.

Connecticut's concentration of military and small-arms manufacture contributed much to the nation's efforts in World Wars I and II and the Korean and Vietnam wars.

While Connecticut has a healthy two-party system, Democrats have dominated state politics since the Great Depression of the 1930s. Governors Wilbur Cross, Chester Bowles, Abraham Ribicoff, and John Dempsey all presided

Industrial development

over periods of unprecedented economic development, school construction, civil rights activity, and increased health and social services. In 1974 Ella Grasso became the first woman in any state elected in her own right to the office of governor.

Connecticut displays sharp contrasts between areas of great wealth and deep poverty. The central cities of Hartford, New Haven, and Bridgeport are particularly affected. In this sense there are two Connecticuts. Closing the gap remains the state's major challenge.   (J.B.Ho./I.J.S.)

Maine

Maine, the largest of the six New England states in area, lies at the northeastern tip of the United States. Its 33,265 square miles (86,156 square kilometres), including 2,270 square miles of inland water area, represent nearly one-half of the total area of New England. Maine is bounded on the northwest and northeast by the Canadian provinces of Quebec and New Brunswick, respectively, and on the west by New Hampshire. The famed rocky coastline of the state is angled from southwest to northeast along the Atlantic Ocean. Maine's capital has been Augusta since its admission on March 15, 1820, as the 23rd state of the Union. There are two theories of the derivation of the state's name: that the state was named for the former French province of Maine and that it was so named for being the "mainland," as opposed to the coastal islands.

Maine is the most sparsely populated state east of the Mississippi River. Nearly 90 percent of its total land area is under forest cover. It is also, by most statistical measures, an economically depressed state, but the rugged beauty and challenge of its climate and landscape and the character of its people have given Maine an importance beyond its economic and political power. Limited economic growth, in fact, has contributed to the preservation of much of its natural appearance. Since 1970 the state's southwestern coastal counties have recorded accelerating growth rates, increased residential and commercial construction, and increased tax revenues. Maine's economy remains dependent on manufacturing related to the timber harvest (mostly paper and paper products). The extractive industries of fishing, mining, and agriculture have been surpassed by trade and the recreational and service industries, these latter accounting for an increasing percentage of the state's income. The state epitomizes the increasingly

Vernon Sigl/Shostal Associates

difficult national choices between preservation of environmental quality and potential economic expansion.

PHYSICAL AND HUMAN GEOGRAPHY

The land.   *Relief.* The Appalachian Mountain chain ex-

Mountain-
ous areas
tends into Maine from New Hampshire, terminating in Mount Katahdin, at 5,268 feet (1,606 metres) the state's tallest peak. The western and northwestern borders adjoining New Hampshire and Quebec have the most rugged terrain, with numerous glacier-scoured peaks, lakes, and narrow valleys. South and east of the mountain areas lie rolling hills and smaller mountains and the broad valleys of the Saco, Androscoggin, Kennebec, and Penobscot rivers.

From Kittery, at the southern tip of the state, to Cape Elizabeth, just southwest of the state's largest city, Portland, long sand beaches are interrupted intermittently by rocky promontories. North and east of Cape Elizabeth the coastline of Maine is a series of peninsulas, narrow estuaries, bays, fjords, and coves, once glacier-covered mountains and valleys now partially submerged in the post-Ice Age rise in sea level. The Camden Hills and Mount Desert Island are the largest of the coastal mountains. The tides along this famous rockbound coast are among the strongest in the world, running between 12 and 24 feet (3.7 and 7.3 metres). Off the coast of the state lie about 1,200 islands, some no more than rocky ledges, others topped with trees and sheltering the homes of fishermen, lobstermen, and summer residents. All told, the coast of Maine—including the bays, islands, and inlets washed by the tides—totals some 3,500 miles (5,630 kilometres).

Drainage and soils.   Most of Maine's river systems flow from north to south. The St. John River and its principal tributary, the Allagash, are the major exceptions, flowing north and then east along the northern border of Maine and turning south through New Brunswick, Can., to the

Lakes and
ponds
sea. The state is dotted with 2,500 lakes and ponds, the largest of which is Moosehead Lake (120 square miles). Soils in southwestern Maine were formed primarily from granite; coastal, central, and eastern soils are composed of shale, sand, and limestone; while the soils of Aroostook county, in the northeast, which are among the most productive in the state, are largely composed of caribou loam.

Climate.   Maine has three relatively well-defined climatic areas: southern interior, coastal, and northern. The southern and coastal regions are influenced by air masses from the south and west. North of the land dividing the St. John and Penobscot river basins, air masses moving down the St. Lawrence River basin tend to prevail. Mean annual temperatures range from 37° to 39° F (3° to 4° C) in the north and from 43° to 45° F (6° to 7° C) in the southern interior and coastal regions. Mean temperatures are about 62° F (17° C) throughout the state during the summer and 20° F (−7° C) during the winter. Clear days range from about 100 per year in the south to only 70 in the north, and annual precipitation averages 36 to 48 inches (910 to 1,220 millimetres). Snowfall averages more than 100 inches in the north and at higher elevations.

Plant and animal life.   Flora and fauna represent a combination of subarctic and Appalachian species. Forests include heavy stands of pine, spruce, and fir among the softwoods. Sugar maple, yellow birch, aspen, and paper birch dominate the extensive stands of hardwoods. Among the fauna are deer, moose, black bear, fox, lynx, hare, raccoon, porcupine, skunk, and woodchuck. Songbirds, lake birds, seabirds, and many game species abound throughout the state. Among the many aquatic species are the seal, whale, porpoise, lobster, shrimp, clam, haddock, cod, mackerel, and Atlantic and landlocked salmon, as well as many freshwater game fishes.

Settlement patterns.   Maine's general population distribution reflects the early patterns of settlement along the coast and the river valleys, with vast sections of the interior covered with forest and virtually uninhabited except for occasional lumber encampments. About one-half of the population is concentrated in four southwestern counties: Androscoggin, Cumberland, Kennebec, and York. Almost one-half of Maine's residents live in what are classified as urban areas, but there are only a few cities of 25,000 or more inhabitants.

Coastal Maine is best known, from anecdotes and dialect

The
coastal
region
stories, as the traditional home of the "Down East Yankee." Many communities in the region, relatively isolated from the principal avenues of highway traffic, were once bustling centres of ocean commerce and river trade. Population movements in the state have blurred some of the regional differences, but within the coastal region there are three distinct areas. The southwestern coast, predominantly a resort area, extends from Kittery to the Portland metropolitan region on Casco Bay. The midcoast region, marked by a combination of fishing and maritime activities, vacation and retirement homes, and resort centres, runs from Bath (long a shipbuilding centre) and the mouth of the Kennebec River to Belfast, on the western shore of Penobscot Bay. The eastern coastal region of Maine begins on the eastern shore of Penobscot Bay and ends at Calais, on the St. Croix River, at the New Brunswick border.

Central and southern Maine form a contiguous region covering the southern half of the state, from the New Hampshire border to the Penobscot River. It contains the bulk of the population and most of the industrial and commercial activities. The western border areas of York, Cumberland, Oxford, and Franklin counties form a subregion within the state, but increased mobility is tending to erode the distinctive community and speech patterns of those sections.

Aroostook county, a region by itself, is often referred to as "the" county. Central and southern Aroostook areas were settled by English and Irish immigrants whose speech patterns continue to resemble those of their neighbours across the border in New Brunswick more than they do the broad *a*'s and dropped *r*'s of the rest of Maine speech. The St. John valley along the northern border of Aroostook county was settled by Acadians of French descent from Nova Scotia and New Brunswick. The communities of the valley retain their French character and speech.

Maine's rocky terrain limits the size of farms in most areas of the state. With the exception of Aroostook county and a few broad valleys in the central region, the fields are small, and in many cases they are marked by old stone walls or separated by wooded lots.

Interior rural communities in Maine vary according to

Rural
life
the terrain and their economic history. Some consist only of a crossroads settlement with a store, gas station, post office, and three or four homes; others have a church, school, a few stores, and small establishments clustered around a millsite; still others have the traditional village green, often with the typical white frame, single-spired New England church, as well as such social centres as a grange hall. Communities in the state that prospered during the height of the lumber trade are marked, where the terrain permits, by broad avenues and imposing wooden homes. Coastal communities are similar, with commercial areas on the waterfront and social, cultural, and residential centres on higher ground.

Maine's largest urban communities are Portland, Lewiston–Auburn, Bangor, Augusta, Biddeford, and Waterville. Portland is the centre of a metropolitan area spreading inland and around the harbour city, which lies on Casco Bay. It is the commercial and transportation hub of the state, whose economy has a growing and diversified industrial base, including paper manufacturing, steel fabrication, light manufacturing, and assembly. Bangor, an old lumbering town at the head of navigation on the Penobscot River, is the commercial centre for eastern and northern Maine. Augusta, the state capital, lies at the head of navigation on the Kennebec River. State government is the principal source of employment for the city, but it is also the site of textile, shoe, and paper industries.

The twin cities of Lewiston and Auburn form the second largest urban centre in the state. Long dependent on textile and shoe manufacturing, the two communities have pursued aggressive industrial development programs and have diversified into electronics and light manufacturing. They also serve as a commercial and trade centre for the Androscoggin valley and eastern Oxford county. Biddeford, south of Portland at the base of Saco Falls, is a lumbering and textile centre. Waterville, north of Augusta on the Kennebec, with its neighbouring communities of

Winslow and Fairfield, is a pulp-and-paper and textile centre and a commercial and trade centre for the central and northern Kennebec valley.

The people. The original Down East Yankees were English and Scotch-Irish Protestant immigrants who made the most substantial and persistent early European settlements in Maine. They set the style of dour and taciturn industry and dry wit that is characteristic of Maine legends and stories. Their descendants dominated the political and economic life of the state during most of its development, and they constitute its largest population group, particularly in the smaller communities and rural areas.

Contrary to popular impressions, however, Yankees are not the sole inhabitants of Maine. Two groups of French descent make up the second largest ethnic bloc in the state. The Acadians, originally from Brittany and Normandy, were driven out of Nova Scotia in 1763 by the British; many of them settled in the St. John valley, which now forms the northern border of Maine, while others made the long trip to Louisiana. The later French-Canadian migration from Quebec province began with the growth of the lumber and textile industries following the American Civil War. French is the primary language in much of the St. John valley, and it is the second language in Maine's industrial cities. Irish immigration to the state began in the 18th century, and the Irish and the French make up the bulk of Maine's Roman Catholic population. French Huguenot and German settlements were established early near the coast. During the 1870s the state encouraged the building of a Swedish settlement in Aroostook county as part of a program for agricultural development and population growth.

Most of the remaining few thousand members of the original American Indian population of the area live on state reservations. The nonwhite population of Maine is less than 2 percent.

The economy. Maine's forest and waterpower resources invited exploitation during the early years of the Industrial Revolution; for a long time, skilled, low-cost labour provided an advantage to the textile and shoe industries until those industries moved their operations to factories in low-wage areas of the South and overseas.

Aroostook county, where the potato is the main crop, is one of the few areas with rich agricultural soils. Terrain and soil conditions throughout most of the state are inadequate for large-scale farming. With the exception of lobster production, fishing is a marginal industry. As a result of these factors, Maine is a relatively poor state, with the lowest income per capita in New England.

Since 1955 the state government has promoted an active economic development program through the Department of Economic and Community Development. Public and private agencies have combined to form the Finance Authority of Maine and the Maine Municipal Bond Bank to encourage investment and provide loan guarantees. The state also has used the services and financial assistance of the federal Economic Development Administration and of the Small Business Administration.

Economic resources and components. Maine's primary natural resources are timber, sand, gravel, limestone and building stone, fish, and shellfish. There are limited deposits of copper, zinc, feldspar, and semiprecious stones. Peat is mined for horticultural use. Soils and climate have contributed to the production of high-quality potatoes and of apples, blueberries, and other fruits. Dairying is also an important activity.

The services sector represents the largest component in the market value of Maine goods and services; the manufacturing sector is second, and the trade sector is third. Pulp and paper constitute the largest item in manufactured products, potatoes and poultry in farm income, and lobsters in the fishery industry. Tourists—attracted by Maine's picturesque lakes, streams, and coast and the opportunities for swimming, boating, fishing, hunting, hiking, and winter sports—account for a large portion of retail sales and service income.

Electrical power. More than three-fourths of the electrical energy generated within the state is produced in steam plants; a large percentage of the steam is supplied by nuclear power, hydroelectric stations and diesel and gas-turbine units providing the remainder. Many of the state's hydroelectric sites have been restored, and biomass generators have been constructed in eastern Maine. Agreements to purchase surplus power from Canadian hydroelectric generating stations have been negotiated. Since 1972 a consortium of New England utility companies has operated the Maine Yankee atomic power plant at Wiscasset.

Transportation. Maine depends heavily on its roads for ground transportation. Railroads carry freight but no longer carry passengers. Buses provide interstate, intrastate, and some suburban and urban passenger transportation. Portland and Searsport are the major seaports. State and private passenger and freight ferry services operate to many of the coastal islands, and Portland and Bar Harbor have ferry connections with Yarmouth, N.S., Can. Several airlines operate from Presque Isle, Bangor, and Portland to points outside Maine; commuter airlines provide intrastate and interstate service to other Maine communities. Some international nonscheduled air passenger and freight traffic is routed through Bangor International Airport.

Administration and social conditions. *Government.* The constitution of the state was adopted in 1819. It is based on the constitution of the Commonwealth of Massachusetts and reflects colonial traditions of checks and balances. The governor, Maine's chief executive officer, is checked by the members of the Maine House of Representatives and Senate and their joint standing committees. This legislature elects several constitutional officers, including the attorney general, the secretary of state, the auditor, and the state treasurer. Department heads, appointed by the governor, are approved or rejected by the Senate. In 1957 the state legislature approved a constitutional amendment extending the governor's term to four years, with a two-term limit.

The legislature, which has a 151-member House and a 35-member Senate, is elected every two years. The president of the Senate is the constitutional successor to the governor. Maine has a three-tiered judicial branch, including district judges, a superior court, and a supreme court. Probate courts serve at the county level.

Maine's 16 counties traditionally have provided an administrative framework for the superior court system, law enforcement, land records, and probate practice and for some road maintenance and construction functions. Town government, with the annual town meeting and a board of selectmen, prevails in most communities. More than 20 communities operate under city charters. Professional managers are used in most cities and in many towns.

Local communities depend for revenues on property taxes, on automobile excise taxes, on fees for hunting, driving, and other licenses, on state aid for education, roads, and welfare, and on federal grants-in-aid. State revenues are obtained from a corporate and personal income tax, inheritance tax, sales and use taxes, motor fuel taxes, tobacco and alcoholic beverage taxes, licenses and miscellaneous taxes, federal grants-in-aid, and a state lottery.

With the election of 1954, traditional Republican dominance in Maine's state offices and national representation ended. Thereafter, Democrats have competed successfully with Republicans for the governorship and for federal and state legislative seats. Party officials are elected in local caucuses and state conventions. Nominations for county and state offices are obtained through primary elections, but Maine has no presidential-preference primary.

Education. Local governments are responsible for public elementary and secondary education, under the general supervision of a state board of education. Most rural areas are served by multicommunity school administrative districts. The state operates technical institutes for post-secondary vocational training. The University of Maine, established in 1865 in Orono as a college of agriculture and mechanic arts, has been reorganized into a seven-branch system and offers a broad range of undergraduate and graduate curricula. Private liberal arts colleges include Bowdoin College (Brunswick; 1794), Bates College (Lewiston; 1864), and Colby College (Waterville; 1813).

Welfare. Maine's chronic economic problems are reflected in the high incidence of poverty. The largest pro-

Marginal notes:

French language in Maine

Economic development programs

Executive officers

portion of poverty is found in the rural counties of the state, particularly in the eastern coastal counties and in Aroostook county. Public awareness of Maine's poverty and of the particular difficulties faced by the state's small Indian and black populations has led to vigorous efforts by community action groups, civil rights organizations, and health and housing associations to improve economic opportunity, as well as to deal with the related problems of housing, education, and health. Most poverty assistance is administered by the state Department of Health and Welfare.

Cultural life.   In its culture, as in its social and economic development, Maine reveals the attributes of both a struggling frontier community and an eclectic society immersed in commerce with other cultures. Folktales, songs, local humour, and the short stories and poems of native authors are direct, earthy, and filled with a sense of the absurdity of man's awkward attempts to subdue nature.

The tools of the woodsman, farmer, and fisherman are clean and simple, as are the lines of country homes, meetinghouses, and working boats. The great mansions of the old seaports, among some of the finest memorials to an earlier America, are filled with chairs, tables, chests, books, prints, hangings, screens, pottery, and bric-a-brac gathered on the many voyages of Maine's seamen to Europe and Asia, as well as with examples of the shipbuilders' and sailors' arts of wood carving and scrimshaw. Maine has, in addition, the unique contributions of such groups as the Shakers and its own local versions of the Federal, Greek Revival, Gothic, and Victorian periods of American architecture.

Maine has had a revival in crafts production, including pottery, metalworking, block and silk-screen printing, weaving, furniture making, and carving. State agencies, historical societies, museums, and local associations are engaged in preserving historic sites and in the collection, preservation, and presentation of materials on Maine's heritage. The Marine Maritime Museum is located in Bath.

Maine has been, and continues to be, the birthplace or the permanent or seasonal home of well-known figures in the American arts. They have included such writers as Henry Wadsworth Longfellow, Harriet Beecher Stowe, Sarah Orne Jewett, Edwin Arlington Robinson, and Edna St. Vincent Millay; the painters Winslow Homer, John Marin, Edward Hopper, and Andrew Wyeth; and composer Walter Piston. Among the state's largest and finest museums are the Portland Museum of Art; the Colby (College) Museum of Art, which has a large collection of works by Winslow Homer; and the Museum of Art on the Bowdoin College campus. Active cultural programs are sponsored by the state's colleges and universities, museums, community symphonies, workshops and camps, and numerous summer theatres.

Acadia National Park, which extends over most of Mount Desert Island and Isle au Haut, was the first national park east of the Mississippi River. Other recreational attractions include Baxter State Park, a wilderness area of 200,000 acres (80,940 hectares) surrounding Mount Katahdin; the 92-mile Allagash Wilderness Waterway; and more than 100 state parks and historic sites.

HISTORY

Indians

Algonquian Indians were the earliest known settlers in Maine. They lived along the river valleys and the coasts, hunting, fishing, and planting crops. Few of them survived the arrival of the European settlers. But the earlier tribes are remembered in numerous place-names; in the sites of their camps and burial grounds; in ancient trails and water routes; in the use of the canoe, the snowshoe, and the toboggan; in crops such as corn (maize), beans, and squash; and in the revived concern for the natural environment.

Explorations and disputes.   The first European explorations of Maine are shrouded in mystery. Evidence that Norsemen landed on the coast is scant and disputed, and serious questions exist about some of the early British claims based on John Cabot's voyages in the late 1490s. Portuguese, Spanish, French, and English explorers did probe the islands, the bays, and the rivers of the "maine" throughout the 16th century; by the first decade of the

17th century, summer fisheries had been established on some of the coastal islands, and fur trade had begun with the Indians.

An area claimed by both the French and English crowns was an intermittent battleground between the English, the Indians, and the French from 1615 until 1675 and a constant battleground from that date until 1763, when the British conquered the French in eastern Canada.

Maine was given separate provincial status in New England under royal patents granted by Charles I. The Puritans of Massachusetts took over the territory when the proprietor, Sir Ferdinando Gorges, backed the losing side in the English Civil Wars. Frontier settlers in Maine chafed under Massachusetts rule, but the merchants of the coastal towns resisted the separation movement until the War of 1812, when popular resentment against the failure of the Massachusetts Commonwealth to protect the District of Maine against British raids tipped the scales in favour of separation. Maine entered the Union as a free state under the Missouri Compromise of 1820.

The northeast boundary of the state was a matter of serious controversy between the United States and Britain. The Treaty of Paris (1783) identified the boundary in part as extending along the middle of the St. Croix River to its source and from there north to highlands running northwest to the "head of Connecticut river." Identifying these highlands proved to be difficult. Efforts at arbitration failed in 1831, and the disputed area was the scene of the so-called Aroostook War of 1838–39. In March 1839 General Winfield Scott arranged a truce calling for joint occupancy of the disputed territory. This remained in effect until 1842, when a settlement was reached that divided the territory virtually in half.

Statehood.   Maine intrigued entrepreneurs who hoped to make their fortune in furs, fisheries, timber, and land development. The first three proved to be lucrative for a few, but the climate, border troubles, and the availability of more fertile land in the newer territories to the west curtailed settlement of the area before and after statehood. The period of greatest economic growth came between 1830 and 1860, when lumber, ice, granite, lime (extracted from limestone), and fishing and shipbuilding dominated the state's economy. Coastal communities flourished and railroads developed as Maine merchants traded around the world.

Economic growth

The American Civil War and the Industrial Revolution diverted workers and capital from Maine during the last decades of the 19th century. Textiles and paper products became the primary sources of manufacturing employment, while fisheries and agriculture continued as important but uncertain sources of income. The details of economic activity changed during the first half of the 20th century, but the overall picture remained one of precarious prosperity and extreme susceptibility to swings in the national economy.

Political development.   Maine's social and political history has been dominated by struggles against the adversity of frontier life and economic limitations, coupled with strong drives within the state for social reform, including world peace, abolition of slavery, prohibition, and women's suffrage. Jeffersonian and Jacksonian Democrats held sway from statehood until the rise of the Whigs and the emergence of the Republican Party. The Abolitionist movement gave the Republican Party its start in Maine in 1854, and the Grand Old Party dominated the state for almost a century. Democrats scored temporary gains in the elections of 1910 and 1912 and, during the Great Depression, in the elections of 1932 and 1934, but it was not until 1954 that sustained competition began to develop between the major parties.

Aboli-
tionism
encourages
Republican
growth

Since the 1950s Maine has had Republican, Democratic, and Independent governors, each presiding over an economy that has recorded slow but steady gains. These gains have been the result of an increase in the service economy of southwestern coastal Maine, an economy energized by the in-migration of new residents, many from Northeastern corridor states. The resulting pressures on native coastal residents have produced local and state regulations designed to plan for and control economic growth rates

that have exceeded 10 percent per year in Maine's southern counties. (E.S.M./J.N.C.)

Massachusetts

Like others of the 13 British colonies along America's Atlantic seaboard in the 17th and 18th centuries, Massachusetts was founded by people seeking in a wilderness for a new way of life involving such then-untried notions as freedom of religion and self-government. These and other ideals were severely tested during more than 150 years of colonial life, but they came to provide much of the ideological underpinning of the American Revolution, from which Massachusetts emerged as one of the founding and leading members of the new United States.

One of the six New England states lying in the northeastern corner of the nation, the Commonwealth of Massachusetts, as it is known officially, is bounded on the north by Vermont and New Hampshire, on the east and southeast by the Atlantic Ocean, on the south by Rhode Island and Connecticut, and on the west by New York. It covers 8,284 square miles (21,456 square kilometres) and ranks 45th among the states in area. The residents represent an amalgamation of the prototypical Yankee spirit of an earlier America and the energies of the later immigrants who flocked to its cities in the 19th century.

Massachusetts has been, nearly from its founding, a leading force in American education During the 19th century Boston, its capital, became synonymous with the highest attainments in America's cultural and artistic life, and the state as a whole provided industrial and financial leadership for the nation. Though these latter positions have long since been yielded to larger and faster-growing states and regions, the history and people of Massachusetts have left an indelible mark on the development of the American consciousness.

PHYSICAL AND HUMAN GEOGRAPHY

The land. The Massachusetts coastline is about 1,500 miles (2,400 kilometres) in length, yet the cross-country distances are only 190 miles from east to west and 110 miles from north to south. The jagged coast winds from Rhode Island around Cape Cod, in and out of scenic harbours along the shore south of Boston, through Boston harbour and up the North Shore, swinging around the painters' paradise of Cape Ann, to New Hampshire.

Relief. The indented coast of Massachusetts was formed by the great glaciers that in places covered the land with several thousand feet of ice. When the last ice disappeared some 11,000 years ago, massive chunks of rocks were exposed along the shore. Hard, flat land stretches out beyond, becoming stony upland pastures near the central part of the state and a gently hilly country in the west. Except toward the west, the land is rocky, often sandy, and not fertile.

Cape Cod and the offshore islands
In the southeast Cape Cod juts out into the ocean. This 65-mile-long appendage is rectangular in shape except at its easternmost point, where it hooks northward. The offshore waters are among the most treacherous in the country. Henry David Thoreau wrote that to the people of Provincetown, at the tip of the cape, the sea is their garden and the dog that growls at their door is the Atlantic Ocean. Tufts of grass spring up along the sand dunes, and gnarled jack pines and scrub oaks, some only head high, grow in bunches. Off the southeastern coast lie the islands of Nantucket and Martha's Vineyard, lashed by the gray Atlantic in winter but in summer alive with thousands of tourists and longtime seasonal residents.

Central Massachusetts comprises rolling plains fed by innumerable streams. Beyond lies the broad and fertile Connecticut Valley and the Berkshire Hills. The now-paved Mohawk Trail crosses the Berkshires, the Hoosac Range on the east and the Taconic Range on the west. The state's highest point, 3,491 feet (1,064 metres), is Mount Greylock on the Taconic side near Adams. In North Adams a natural bridge of white marble has been formed by the wind and water, and at nearby Sutton is a half-mile-long gorge that knifes through the rock, exposing 600,000,000 years of geologic history.

Farmland along the Connecticut River near Sunderland, Mass.
Gene Ahrens/Shostal Associates

Drainage. The land is veined with rivers—19 main systems, the best known of which are the Connecticut, Charles, and Merrimack. More than 1,100 ponds or lakes lie among the hollows of the hills, one in almost every one of the more than 350 communities. Many bear long Indian names, most notably Lake Chargoggagoggmanchauggagoggchaubunagungamaugg (which, translated, means "You Fish on Your Side; I Fish on My Side; Nobody Fishes in the Middle"). The best-known small body of water, however, is Walden Pond, immortalized by Thoreau.

Rivers and lakes

Although clean-up efforts have lessened the pollution, nearly all the rivers and many lakes are unsuitable for swimming. This has long been true of the meandering Charles, which separates Boston and Cambridge and which is favoured by college rowing crews, canoeists, and sailboat enthusiasts.

Climate. The state has a temperate climate. The climate is colder but drier in western Massachusetts, although its winter snowfalls may be more severe than those nearer the coast. July is the hottest month, averaging about 71° F (22° C), in contrast to 26° F (−3° C) in January. Annual precipitation averages 42 inches (1.067 millimetres) in Boston and 44 to 45 inches in Worcester and Pittsfield.

Plant and animal life. Despite its industrialization, Massachusetts has preserved many of its forests, and there are now nearly 150 state forests, reservations, and parks. Public hunting grounds amount to some 23,000 acres (9,300 hectares). Three national wildlife refuges and the Cape Cod National Seashore allow further contact with nature. Not far from downtown Boston is the Arnold Arboretum, which has one of the largest collections of trees and shrubs in the United States.

Few large animals remain in the wild, but an occasional bear or moose is sighted. Other animals seen in the woods include deer, beaver, muskrat, mink, otter, snowshoe hare, red fox, woodchuck, raccoon, and chipmunk. Along the shores the sandpiper, blue heron, American egret, sanderling, and turnstone can be seen. Water birds include the gull, scoter, cormorant, and loon, while those most often seen on land are the kingfisher, warbler, bobwhite, brown thrasher, sparrow hawk, yellow-shafted flicker, and whippoorwill. Game birds include ruffed grouse, wild turkey, and pheasant.

Settlement patterns. The earliest settlements were along the seacoast, with the population most heavily concentrated in those towns that lay at the mouths of rivers. The

settlers fanned inland along these streams, drawing on them at first for farm use and later for the power to run mills. Early towns were also settled along the Connecticut River in the western part of the state.

Today, the lure of the sea results in nearly equal popularity for all of the towns along the coast, where sunbathing, swimming, yachting, and fishing are a way of life. Among these coastal towns are Plymouth, with its long harbour; Duxbury, Marshfield, Scituate, and Cohasset, where the first suburbs sprang up in colonial days; the boating bays from Hingham to Boston; the beaches at Revere and Lynn; Gloucester and Cape Ann, famous for fishing; and Marblehead, the yachting capital of the world.

Boston is surrounded by communities many of whose residents work in the city by day, sleep in the suburbs by night, and clog the highways commuting back and forth. Other urban cores include Springfield, Worcester, Fall River–New Bedford, Lowell–Lawrence, Pittsfield, and Fitchburg. These cities, which grew large during the Industrial Revolution, have since declined in population.

The people.   *Ethnic composition.*   Boston and San Francisco are often referred to as sister cities because of such similarities as busy oceanside ports, good restaurants, emphasis on culture, prominence of religion in civic and social life, fine architecture, and echoes of a colourful history. Their ethnic mix is comparable as well. The blend of peoples in Boston has spread across the state. Although Boston is heavily Irish, so too are the urban areas in western Massachusetts, and the native brogue of Irish immigrants is more likely to be heard around Springfield, Westfield, and Holyoke than it is in Boston. In the first half of the 20th century, large numbers of Italians followed the Irish immigrations of the 1800s. By the 1960s and '70s the newcomers to the state were mostly Spanish-speaking, from Cuba and Puerto Rico.

The English stock that still forms the backbone of the population is intermingled with Slovaks, Poles, Canadians, Russian Jews, Greeks, Scandinavians, Syrians, Germans, French, and Chinese. Fall River and New Bedford are the homes of many Portuguese and Cape Verdians. Blacks are concentrated mainly in the Roxbury and Dorchester sections of Boston and in Cambridge and Springfield.

Few Indians remain in Massachusetts, despite the prevalence of Indian place-names. The state was named by Captain John Smith for the Massachuset tribe, whose name meant "Near the Great Hill," believed to refer to Blue Hill that rises south of Boston in an otherwise flat area.

Religion.   Massachusetts is now largely Roman Catholic, though its religious foundation was solidly Protestant. The Pilgrims, who established the Plymouth colony in 1620, and the Puritan settlers came to Massachusetts mainly for religious reasons. The *Mayflower* colonists were a small groups of Separatists who had fled to Holland from England to practice their religion without official interference. Economic hardship and a desire to establish an identity free of Dutch influence prompted them to seek out America. The Puritans, persecuted in England because of their religious beliefs, sought ecclesiastical reform, but only within the church structure. They were not advocates of religious tolerance, as other Protestant groups and radical thinkers discovered. Many with differing religious views were banished, including Roger Williams from Salem and Anne Hutchinson from Boston. Unrepentent Quakers and Anabaptists were banished, and a few were executed.

The Puritan Massachusetts Bay Company essentially established a theocracy, with close ties between the government and the clergy. The leaders felt comfortable not only in establishing patterns of government by interpreting the colony charter but also in interpreting the will of God for the people. The arrangement fell short of its purpose. When in 1634 Governor John Winthrop refused to call a meeting of the legislature, or General Court, the freemen demanded to see the charter. He acceded, divulging his infringement on the rights of the legislature, and a bill was quickly passed vesting governmental power in the freemen.

During the subsequent development of Massachusetts, religion remained important. The Puritan Congregational church was not formally disestablished until an amendment to the state constitution was passed in 1833. Following colonial patterns, churches often are found in the most prominent places of the towns and villages, symbolizing their traditional role in social life.

Social hierarchies.   All the people of Massachusetts may be created equal, but some gained an edge earlier than others. The variety of peoples in the state fails to alter the fact that the major concentration of wealth and power continues to be controlled by the 800 or so families who trace their pedigrees to the *Mayflower* and those who in the following centuries so successfully trod the avenues of commerce, finance, and culture that they came to be considered among the ranks of that still-relevant cadre, the Proper Bostonians. Many descendants of later immigrants also have found their way to the top of the financial—and often political—ladder. The proud tradition of family participation in the building of the state extends also to those of less-exalted position: a large proportion of the residents of small-town Massachusetts, especially in the west, can claim many generations of Yankee background.

The economy.   The economy of Massachusetts today is based largely on technological research and development, service industries, and tourism. This represents a major shift from the state's preindustrial agricultural basis in the 17th and 18th centuries and the heavy manufacturing that characterized the 19th and the first half of the 20th centuries.

Fishing and agriculture.   Foreign trade, fishing, and agriculture long buoyed the economy. Salem sailors brought exotic goods from China, the West Indies, and other faraway lands. Fishing was lucrative, adventuresome, and dangerous—more than 10,000 Gloucester fishermen have lost their lives over the centuries. Fishing and shipbuilding went hand in hand. Between 1789 and 1810 the Massachusetts fleet grew 10-fold, some of it to aid in defense against British and French aggressions on the high seas. Yankee sailors also found much "black gold" in the slave trade between West Africa and Southern ports.

At the height of the whaling boom in the 19th century, 329 whaling vessels sailed from New Bedford, in addition to others from Nantucket and other ports, bringing in $10,000,000 worth of cargo each year in their holds. This great industry was not to last, however: by the turn of the century its contribution to the state's economy had dwindled to only a fraction of its former importance. Fishing later suffered substantial reverses as well. A $42,000,000 annual business in the early 1960s, fishing began to wane late in the decade because of foreign competition in the traditional Atlantic fishing grounds and the depletion from overfishing of such species as haddock and lobster. By the late 1970s, however, the industry had made a comeback, and Massachusetts usually ranks among the top three or four U.S. states in value of fish landings.

The generally rocky soils support only truck gardening, although the purple sandy bogs of southeastern Massachusetts and Cape Cod produce about 50 percent of the U.S. cranberry supply. Greenhouse and nursery products are the main source of farm income, followed by dairy products.

Industry.   Massachusetts has been a manufacturing state since the early 1640s, when John Winthrop, Jr. (son of Governor Winthrop), opened a saltworks in Beverly and ironworks in Saugus and Quincy. Francis Cabot Lowell was largely responsible, however, for raising the state to its manufacturing eminence. Lowell went to England to study methods of textile operations and built a power loom in Waltham in 1814. He died in 1817, but his associates developed Lowell, the city built of bricks, with its mills driven by the Merrimack River.

Yankee ingenuity fostered much early handicraft-based industry, though the influx of unskilled, low-paid labourers from Europe during the 19th century was the necessary ingredient for the mass production that developed in the state's shoe and textile factories. One of the first and largest shoe plants in America was the United Shoe Machinery Corporation in Beverly, while the building of the Springfield armory in 1777 boosted industry in western Massachusetts at the same time that it aided the Revolutionary cause. Other well-known goods from

(margin notes:)

Coastal towns

Religious Separatists and other dissenters

The golden age of the Yankee seafarers

Massachusetts factories included watches from Waltham, Salem, and Boston; rockers from Gardner; cutlery and hand tools from Greenfield; guns and motorcycles from Springfield; leather goods from Peabody; shovels (which were used by the forty-niners during the California gold rush) from North Eaton; envelopes from Worcester; paper from Holyoke; silverware from Newburyport; and razor blades from Boston.

Today, the electronics and communications industries draw heavily upon the many educational institutions in and around Boston. The suburbs of Boston have become known for their research-and-development facilities, which have contributed significantly to computer technology. Copper and iron were once mined in Massachusetts, but mineral production is currently limited to sand and gravel, stone, and clay.

Transportation. "Never, in these United States, has the brain of man conceived, or the hand of man fashioned, so perfect a thing as the clipper ship," wrote historian Samuel Eliot Morison in *Maritime History of Massachusetts.* All clipper ships were built between 1850 and 1855, and from then on a kind of World Series of ship racing began. The champion was Donald McKay's *Flying Cloud,* which sailed to San Francisco in 89 days, went 374 miles in one day, and averaged 13.5 knots over four days. Records were not the only motivating factor: the clippers carried 1,700 tons of cargo.

Symbolic of Massachusetts' close relation to the sea, the first lighthouse in the United States, Boston Light, was built off that busy port in 1716.

Water formed the Bay State's highway system for 200 years. Rivers such as the Connecticut and Merrimack and man-made canals such as the Middlesex served early needs well. The Boston Post Road and the Mohawk Trail were the most heavily traveled of the early roadways. Opened to Boston–New York mail in 1673, the Post Road consisted of three routes. The Mohawk, an Indian footpath that was converted to an ox road by the settlers, became the first interstate toll-free road, called Shunpike, in 1786.

In 1826 the nation's first railroad brought granite from the quarries of Quincy and Charlestown for the building of the Bunker Hill Monument in Charlestown. The cars were horse drawn. A steam railroad connected Springfield and Worcester in 1839, and 15 systems were shuttling freight among western Massachusetts cities by 1855. Among the most impressive feats of early railroad building was the 4.5-mile Hoosac Tunnel, drilled under the Hoosac Range between 1851 and 1875. The first electric street railway was built in Brockton, and Boston had the nation's first passenger subway, as well as an elevated system. Boston's Logan International Airport, stretching parallel to the harbour, is one of the few large air terminals in close proximity to a major city.

Administration and social conditions. *Government.* From the Mayflower Compact, drawn up by the Pilgrims in 1620 when the concept of "the divine right of kings" dominated Europe and the idea of self-government was little more than an exotic notion, a form of government evolved of which the people could feel themselves a part. In 1630 the Puritans settled in Massachusetts under the authority of a charter granted them by King Charles I of England. The charter was similar to those of many other trading companies, except that it allowed the officers of the company to meet in Massachusetts rather than in England. The relative isolation of the colony and the lack of interference from England allowed the development of a virtually autonomous government. The state's legislature, known officially as the Great and General Court, traces its origins to John Winthrop and his 18 assistants. In a dispute over a stray pig, the court became bicameral in 1644. The assistants became the upper chamber, while two deputies elected from each town constituted the House.

After independence was declared, the General Court drew up a constitution for the State of Massachusetts Bay. It was rejected by the people, in part because it lacked a declaration of rights but also because it was not written by an elected constitutional convention. In 1779 a new convention was elected and convened in Cambridge. John Adams was the principal author of the new constitution of

the Commonwealth of Massachusetts, which was ratified in 1780. Many of its features were directly incorporated into the federal Constitution. One of its provisions permits the governor and his council or the legislature to seek advisory opinions on questions pertaining to the scope of gubernatorial or legislative power from justices of the Supreme Judicial Court. Today, Massachusetts is the only one of the 13 original states still governed under its first constitution, which is the oldest governing constitution in the world. It has, however, been amended many times.

The first meeting of the General Court as the legislative body of the new state took place in October 1780, exactly 150 years after the first meeting of the Puritans' Great and General Court. It today comprises 40 senators and 160 representatives; both houses serve two-year terms. The state's judiciary mainly divides into the district courts for handling minor matters, superior courts for trial by jury, and the Supreme Judicial Court. Justices are appointed by the governor with the advice and consent of the Executive Council. The legislature establishes details concerning the arrangement and operation of the judicial system.

The legislative process in Massachusetts is characterized by several distinctive features: legislation may be introduced by citizen petitions; bills are referred to the appropriate joint standing committee prior to legislative debate; public hearings are held by the committees for most legislative proposals; and the committees are required to submit a report to the General Court for each bill, with their recommendation.

Another political phenomenon that grew up shortly after the settlers arrived was the town meeting, which started as a forum for settling local quarrels and grew to what is in many smaller towns the community event of the year. (As the poet James Russell Lowell observed, "Puritanism, believing itself quick with the seed of religious liberty, laid, without knowing it, the egg of democracy.") The first recorded meeting was in Dorchester in 1633, when citizens were summoned by the roll of a drum. A year later Charlestown organized the first Board of Selectmen, the emergence of such local government balancing the power of the colony's executive. The relationship between the General Court and municipal governments, which was not specified in the constitution, was finally addressed with the passage of the Home Rule Amendment in 1966. This provides that municipalities can make changes in their government without securing the permission of the legislature. A county system was patterned after the English model, in which the greater powers reside in townships and cities rather than in the counties, which serve chiefly judicial purposes.

Massachusetts politics is now dominated by the Democratic Party. Fueled by the massive Irish immigration of the 1840s and '50s, the Democrats slowly broke the Republican monopoly on state political offices. During the late 19th and early 20th centuries, politics became a means to a better life—to a place alongside the "Boston Brahmins" of *Mayflower* heritage—for the Irish and other immigrant groups who experienced great discrimination and hostility. In 1881 Lawrence became the first major city to elect an Irish Catholic mayor; Boston followed suit in 1884. The Boston Irish politician has become legendary, mostly because of Mayor (and Governor) James Michael Curley, a skillful orator from a lowly background who was jailed twice, once while in office.

The state has played an important role in national politics. It has contributed five presidents—John Adams, John Quincy Adams, Calvin Coolidge, John F. Kennedy, and George Bush—as well as a great number of Cabinet officers, career officers, diplomats, and congressional leaders.

Education. Education lies close to the heart of Massachusetts' social and cultural life. Harvard College (now Harvard University) was founded in 1636 in New Towne (now Cambridge). Although it was designed originally to provide the wilderness colony with a continuing supply of trained clergy rather than an educated lay population, its graduates became community leaders and schooling soon was provided colonywide. In 1647, towns with 50 householders were required to support an elementary school; those with 100, a secondary school.

(margin left) Electronics and communications

(margin left) The state constitution

(margin right) Founding of Harvard University

Massachusetts became a pioneer as well in kindergarten and secondary education and developed a uniform state public school system in 1840. The state has numerous private preparatory schools of national ranking. Roxbury Latin School, founded in 1645, is among the nation's oldest.

Many of the nation's oldest and most prestigious institutions of higher learning, in addition to Harvard, are located in Massachusetts. The largest, both in Boston, are Boston University (1839) and Northeastern University (1898). Nearby are the Massachusetts Institute of Technology (Cambridge; 1861) and Tufts (Medford; 1852) and Brandeis (Waltham; 1948) universities. Amherst (Amherst; 1821) and Williams (Williamstown; 1793) colleges have perpetuated traditions of academic excellence at small schools, while Mount Holyoke (South Hadley; 1837), Wellesley (Wellesley; 1870), Smith (Northampton; 1871), and Radcliffe (Cambridge; 1879) colleges have been pioneers in women's education. Boston College (Chestnut Hill; 1863) and College of the Holy Cross (Worcester; 1843) are major Roman Catholic institutions. The University of Massachusetts (Amherst and Boston; 1863) is the principal state university.

World medical centre

Health and welfare. Massachusetts is one of the chief medical centres of the world, particularly in the area of specialists and specialty hospitals. It has also been a leader in research, notably at Boston's Children's Cancer Research Foundation. An urgent contemporary challenge is the delivery of medical services to the poor, who have been affected by urbanization and the gradual disappearance of the family physician.

The state was an early leader in the fight to improve social conditions. Regulatory laws were passed, beginning in the early 19th century, to protect residents. State boards, under the supervision of the governor, later grew out of the need to improve conditions in health, education, welfare, labour, banking, insurance, and prisons. The state recognized its responsibility as early as 1818, when it opened an asylum for the insane. The first state almshouse opened in 1854, while the nation's first public health hospital for tubercular patients began operations in 1898. Despite these early gains, care for the mentally ill, alcoholics, addicts, the homeless, and juvenile delinquents remains a problem.

Following colonial tradition, welfare remained the province of the municipalities until it was taken over by the state in 1970. Although the new program was fraught with difficulty, it was an improvement over the system that existed in the mid-19th century, when citizens were still imprisoned for debt. State programs now stress training and educating welfare recipients to allow them to become self-sufficient. Massachusetts' welfare payments are well above the national average.

Cultural life. The blending of an Old World heritage and a New World spirit produced a bountiful cultural environment in Massachusetts.

Literature was virtually lost in the leaden language of the early writings and sermons, though poets such as Anne Bradstreet and Edward Taylor rose well above the level of dogmatizing, and Jonathan Edwards combined taut language and a brilliant theological mind. During what has been called the American renaissance, however, beginning around the time of the Revolution and lasting through much of the 19th century, the state nourished many writers who might be said to have founded the bases of American literature—and who brought it recognition outside the new nation.

Place in American arts and letters

The group of writers who brought fame to Concord are an indication of the inspiration of this period. A deep sense of both community responsibility and individualism may be traced through the writings of Ralph Waldo Emerson, Henry David Thoreau, Nathaniel Hawthorne, and Louisa May Alcott, all of whom were neighbours. The eloquence of Emerson, preacher, philosopher, and poet, carried his concepts of individual spiritual freedom to faraway lands, while Hawthorne found tranquillity in the small town after growing up in the shadows of Salem witches near the House of Seven Gables.

The mountains of Pittsfield also provided a conge-

nial working environment for Hawthorne, as well as for Herman Melville, Oliver Wendell Holmes, and Henry Wadsworth Longfellow (the latter two combining, respectively, medicine and scholarship with their writings). Among other famous writers of the era were John Greenleaf Whittier and James Russell Lowell, as well as Emily Dickinson, today generally acclaimed as one of the finest American poets of the 19th century.

The universities have become central to many of the performing arts (theatre, dance, and music) in Massachusetts, and the Boston Symphony Orchestra generally is regarded as among the finest musical ensembles in the world. Its Tanglewood concerts at Lenox in the Berkshires (begun in 1938) are, with the Jacob's Pillow Dance Festival at nearby Becket, among the major attractions of the New England summer.

Performing arts

Boston's museums appeal to a variety of interests, ranging from the renowned collections of the Museum of Fine Arts, to the Computer Museum, to the John F. Kennedy Library and Museum. Visitors with children often gravitate toward the Museum of Science, the New England Aquarium, and the Children's Museum, which pioneered the use of participatory exhibits. Important collections of historical records are held by the Massachusetts Historical Society, the Massachusetts Archives, the Boston Athenaeum, the Boston Public Library, and the New England Historic Genealogical Society.

Historical sites in Boston draw many tourists. The Freedom Trail provides a trip that includes Boston Common, the old and new (1795) state houses, Park Street Church, the Old Granary Burying Ground, Old Corner Bookstore, Faneuil Hall, Paul Revere House, the Old North Church, and the USS *Constitution,* better known as *Old Ironsides.*

Outside the capital the past seems still alive in three villages: Plimoth Plantation, Old Sturbridge Village, and Shaker Village in Hancock, where the sect established its communal-church concept in the 1780s. Harvard Square in Cambridge is a favourite tourist stop for its potpourri of people, its proximity to Harvard and the Massachusetts Institute of Technology, and the history imbedded in the cobblestone atmosphere along its narrow side streets.

Salem prefers to forget its witch-hunting period of the late 17th century, but visitors to the House of Seven Gables and other "haunted houses" keep the memories alive. In the elm-shrouded Chestnut Street area are Federal-style homes that reflect the days of prosperity for merchants, shipowners, diplomats, congressmen, and writers.

Along the South Shore are Quincy, where the humble homes of the eminent Adams family are located next door to one another, and Hingham, where the Old Ship Church is the oldest surviving church of the 13 colonies. The Bourne Whaling Museum in New Bedford includes a half-size reproduction of a whaling vessel and some 600 logbooks, and the Seamen's Bethel (chapel) there was immortalized by Melville in *Moby Dick.*

West of Boston lies Concord and its Old Manse, home of the Emersons and, for four years, of the Hawthornes. Past the Old Mill and Longfellow's Wayside Inn in Sudbury are Worcester and then Springfield, where the armoury and arsenal are reminders of the city's famous rifle. In nearby Pelham the Town Hall complex has the oldest continuously used meetinghouse in the country and a monument to Captain Daniel Shays, who led a rebellion of poor farmers in 1786. Chesterwood in Stockbridge was the site of the studio of Daniel Chester French, sculptor of the great seated Lincoln statue in Washington's Lincoln Memorial. Some of the doors of houses in Old Deerfield bear the marks of Indian tomahawks wielded during the raids of the early 18th century.

Historic western Massachusetts

Private clubs, both social and athletic, long have been Massachusetts institutions, especially for golf, tennis, and yachting. Among the most exclusive are the Brookline Country Club and the Longwood Cricket Club in Brookline, the Myopia Hunt Club in Hamilton, and various yacht clubs along the North Shore above Boston, particularly in Marblehead.

Athletics have come to form a subculture among all social classes. The professional teams—Boston's Red Sox in baseball, Bruins in hockey, and Celtics in basketball and

the Foxboro-based New England Patriots in football—attract the most attention, but the state also gives considerable emphasis to high school and college athletics.

Although the landing of the Pilgrims on Nov. 21, 1620, was important, Indians had found this corner of the country some 3,500 years earlier, and Leif Eriksson and his Norsemen may have landed somewhere in the Cape Cod region in 1003. European seafarers tapped the fertile fishing areas throughout the 1500s, the French explorer Samuel de Champlain mapped the area in 1605, and in 1614 Captain John Smith of the Virginia colony drafted a detailed map of the New England coast from Penobscot Bay in Maine to Cape Cod.

The two colonies

European settlement.   Prior to 1685 there were two separate colonies within the boundaries of present-day Massachusetts. The area around Plymouth and Cape Cod, settled by the Pilgrims, was known as Plymouth colony, or the Old Colony. By the mid-1640s its population numbered about 3,000 people. The Pilgrims were never granted a royal charter; their government was based on the Mayflower Compact, a document signed by 41 male passengers on the *Mayflower* five weeks before their arrival in the New World. The compact was hardly democratic since it called for rule by the elite, but it established an elective system and a basis for limited consent of the governed as the source of authority. The Old Colony was rapidly overshadowed by its Puritan neighbour to the north, the Massachusetts Bay Company. Fueled by the Puritan migration of the 1630s, and an aggressive sense of authority, the Massachusetts Bay colony expanded rapidly. By the mid-1640s it numbered more than 20,000 people, and it began absorbing settlements in Maine and New Hampshire. The government of the colony was based on a providential interpretation of the royal charter granted by King Charles I, which was transferred to the new settlement by John Winthrop. The exhortation by Winthrop, "For wee must Consider that wee shall be as a Citty uppon a Hill, the eies of all people are uppon us . . . ," underlines the strength of conviction of the Puritan mission.

The Puritan government often operated as an independent state, to the point of minting its own money and even conducting its own foreign affairs. King Charles II finally abrogated the colony's charter in 1684 for repeatedly overstepping its authority. In 1691 a new charter was granted to the Province of Massachusetts Bay after the Glorious Revolution brought William and Mary to the throne in England. The new province formally united Plymouth, Maine, and the islands of Nantucket and Martha's Vineyard with Massachusetts—a configuration that remained until 1820, when Maine was established as a separate state.

Settlers had feared Massachusetts for its hostile Indians, but until 1675 relative peace prevailed because of a pact with Massasoit, chief of the Wampanoag. This accord was ended by King Philip (Metacom), Massasoit's son. His open warfare, King Philip's War (1675–76), ended with his own death, but only after hundreds of settlers had been killed and some 50 towns raided in southeastern and central Massachusetts. Repeated expeditions against the Indians were common in the 18th century, as Massachusetts men joined with British troops to fight the French and their Indian allies.

Commercial and industrial expansion marked 18th-century Massachusetts and resulted in the rapid settlement of new communities, many spurred by speculation. Between 1692 and 1765, 111 new towns and districts were incorporated, while the population increased to 222,563.

Revolutionary period and statehood.   "The shot heard round the world" initiated a new order in Massachusetts and her sister provinces. The struggle had actually begun several years earlier, when a new spirit grew out of years of physical struggle and radical ideas involving such concepts as equality, freedom, and unity. Events in Boston—

Revolutionary War Battles

the fight against the writs of assistance, the Boston Massacre, the Boston Tea Party and resulting closure of the port of Boston, the Battles of Lexington and Concord, Bunker Hill, and the evacuation of the British troops from Boston—inspired song and verse that came to typify

the spirit of the Revolutionary era. Agrarian unrest in 1786–87 resulted in the only military threat to the new commonwealth. Governor James Bowdoin was forced to call out a special state army of 4,400 men to suppress Shays's Rebellion. The unrest and fear generated by the armed insurrection probably helped advance support for the ratification of the new U.S. Constitution. A year later, in 1788, Massachusetts became the sixth state to ratify the Constitution.

Massachusetts was in the forefront of the Industrial Revolution, and the resulting changes guaranteed that by the mid-19th century the state would be vastly different from its colonial antecedents. A decline in agricultural lands fostered both a migration away from Massachusetts and the development of large-scale manufacturing enterprises producing textiles, shoes, and machinery. The rural outlook of the state was lost with the rise of a number of urban areas, connected by turnpikes, canals, and, later, railroads. The shattering of ethnic and religious homogeneity through immigrant migration, especially the arrival of the Irish, accentuated these changes. Property requirements were removed for voters, the Congregational church was disestablished, black Massachusetts regiments fought in the American Civil War, and Irish politicians began to be elected to public office. The population of Massachusetts continued to expand, although at a slower rate than the rest of the country, until by 1860 it had become the second most densely populated state in the nation.

The 20th century.   The consequences of the Industrial Revolution—increasing urbanization, an economy based on manufacturing, and a large immigrant population of low-paid workers—had a major impact on Massachusetts in the 20th century. Most noticeable was the shift of the textile and shoe industries out of Massachusetts to Southern and Midwestern states. Labour unrest, economic stagnation, and urban decay followed. The two world wars brought only brief respites from this decline. The advent of the electronics and communications industries after World War II finally brought this cycle to a halt. Aided by federal money for research and development, numerous small corporations began to draw on the expertise of academics from Boston and Cambridge. High-technology industry began as a suburban phenomenon, but it has also revitalized many of the larger cities, with their large mill complexes now home to numerous research and development firms. This renewal has allowed Massachusetts to maintain its financial, educational, and cultural prominence.   (J.S.D./M.L.Cl.)

Economic changes

New Hampshire

New Hampshire, one of the 13 original U.S. states, is located in New England at the extreme northeastern corner of the nation. With an area of 9,279 square miles (24,032 square kilometres), it is bounded on the north by the Canadian province of Quebec, on the east by Maine and a 16-mile (25-kilometre) stretch of the Atlantic Ocean, on the south by Massachusetts, and on the west by Vermont. The capital is Concord, located in the south central part of the state.

The Granite State, as New Hampshire is popularly known, is a study in contrasts. Since the late 19th century it has been among the half-dozen most-industrialized states in the Union, yet it is frequently portrayed as agricultural and pastoral. Vermont and New Hampshire supposedly constitute a "Yankee Kingdom" dominated by WASPs (white Anglo-Saxon Protestants), yet the state has a large population of residents with French-Canadian, German, Italian, Polish, and other non-English ancestors. Its political reputation is probusiness and conservative, yet the single largest internal source of state funds is a business profits tax. New Hampshire's regional subdivisions are so distinct that numerous people have suggested it be divided in thirds, with roughly equal parts being added to Maine, Vermont, and Massachusetts.

Despite these contrasts, the state has developed a distinct identity. Central to that identity is the image of governmental frugality: New Hampshire has no general sales or individual income taxes but still manages regularly to have

a budget surplus. Frugality at the state level has accentuated the dispersal of responsibility to towns. Although town governments exist in all the New England states, in no state do they carry as much authority as in New Hampshire. Still another component of that identity is a craggy adherence to tradition, symbolized powerfully by the rock profile in Franconia Notch known as the Old Man of the Mountain. The combination of frugality, decentralization, traditionalism, industrialization, ethnicity, and geographic diversity makes New Hampshire very attractive to many Americans. East of the Mississippi, only Florida and Delaware have outpaced it in rate of population growth since 1950.

PHYSICAL AND HUMAN GEOGRAPHY

The land.   *Relief.* The basic physical features of New Hampshire are the result of the last glacial age (approximately 70,000 to 10,000 years ago), during which the Wisconsin ice sheet moved like a huge bulldozer across New England from the northwest to the southeast. Loose sand,

Glacier-formed topography silt, clay, and gravel were deposited as masses of glacial till that, near the town of Greenland, are 395 feet (120 metres) in depth. The mountain notches of New Hampshire—Crawford, Dixville, Franconia, and Pinkham—are the result of the glacial action, as are the potholes and cirques found in the state. The great glacier left many deltas and hillocks of stratified deposits. New Hampshire's lakes are also the results of glacial action.

The mountains are the most striking feature of New Hampshire's landscape. There are about 1,500 classified elevations, including eight mountains rising more than a mile in altitude, 61 rising more than three-quarters of a mile in height, and 157 with an elevation of a half mile or more. The best-known is Mount Washington, at 6,288 feet (1,917 metres) the third highest peak in the nation east of the Mississippi River. The mean elevation of the state is about 1,000 feet above sea level.

Drainage and soils.   New Hampshire has five main river-drainage basins. The largest is that of the Merrimack River in the central part of the state. Second in size is the Connecticut River drainage basin along the western border. The remaining waters flow into the Saco, Piscataqua, and Androscoggin rivers, known collectively as the coastal rivers, as well as into several smaller streams. There are some rich deposits of deep soil along these rivers, but in general the soils within the state are rocky, thin, and difficult to farm.

Climate.   New Hampshire's climate is highly varied. In winter temperatures may drop below 0° F (−18° C) for days at a time. Summers are relatively cool, and the mean annual temperature is about 44° F (6.7° C). Annual precipitation is approximately 42 inches (1,067 millimetres) and is rather evenly distributed over the four seasons.

Plant and animal life.   More than 80 percent of New Hampshire remains under forest cover. The majority of the trees found in eastern United States are indigenous to the state. The most valuable single species of tree has always been the white pine.

The wooded areas support a flourishing wildlife. Whitetail deer are numerous everywhere; the moose herd is limited largely to Coos county. There is a hunting season for deer each year, but the killing of moose is prohibited. Beaver, once almost exterminated, have been protected and are making a comeback. Black bear are relatively common, while smaller mammals like rabbit, squirrel, raccoon, fox, and mink are plentiful. There is an abundance of birdlife, including such species as grouse, woodcock, pheasant, and duck. State rearing stations keep the interior lakes and rivers well stocked for fishing. There has been much concern about the effects of pollution on aquatic life, and strenuous efforts, both public and private, are under way to prevent further contamination of lakes, streams, and coastal waters.

Settlement patterns.   New Hampshire has six distinct regions, each deeply rooted in the state's history. The heavily

Major regions forested White Mountain area in the north is popular with mountaineers and tourists in summer and winter alike. The lakes region around Lake Winnipesaukee is a favoured locality for summer camps and resorts and for water

sports. The seacoast region, which includes Portsmouth, Dover, Exeter, and Hampton, has many maritime activities. The south central, or Merrimack, region surrounds Manchester and Nashua and is the most heavily industrialized section of the state. The Dartmouth–Sunapee Lake region in the west central portion of New Hampshire is dotted with educational institutions and summer homes. The area around Mount Monadnock, in the southwestern corner of the state, is noted for many small industries and such attractions as the MacDowell Colony, a residential retreat in Peterborough for artists, and for the Cathedral of the Pines in Rindge, an outdoor shrine dedicated to the nation's war dead. Each region is officially organized and finances its own promotional activities. The 11 percent of the state's area that constitutes the White Mountain National Forest is almost uninhabited.

The people.   In the first U.S. census, in 1790, New Hampshire had a population of 141,885. Since then each decennial count has recorded a growth, except for that of 1870, when there was an extensive post-Civil War exodus to the Midwest. The urban population is concentrated to a large extent in the southern and southeastern regions, and the larger urban centres are all located south of the White Mountains. In the area nearest Boston, New Hampshire has become a bedroom suburb for thousands of commuters to that metropolis.

In the colonial period the majority of the people were of English origin, but a significant influx of Scotch-Irish, who were largely Presbyterian in faith, began in 1719. They settled in the south central and southwestern portions of New Hampshire and named their principal towns Derry, Londonderry, Antrim, and Dublin.

New Hampshire had a system of town churches in which any officially recognized denomination could be designated at the annual town meeting to receive public tax support. Prior to the American Revolution five denominations were officially recognized: Congregational, Baptist, Presbyterian, Quaker, and Church of England. The system was discarded in 1819 by the Toleration Act passed by the legislature. Since then all churches have been privately supported, and any denomination may function freely.

During the 19th and 20th centuries waves of immigrants came into the state from central and eastern Europe. The first Roman Catholic congregation was established in 1823, the first Roman Catholic school in 1859, and a statewide diocese in 1884. The first Jewish congregation was orga-

nized in 1892 and the first Greek Orthodox church in 1905. The New Hampshire Council of Churches, organized in 1945, has developed broad ecumenical policies to include many faiths.

Blacks comprise less than 1 percent of the population, and those of Asian origin are even fewer. The largest group not directly descended from origins in the British Isles are the French Canadians, or Canado-Americaines, who first began to arrive in the years immediately after the Civil War, chiefly from Quebec. They were attracted mainly to such industrial cities as Manchester, Nashua, Laconia, and Berlin. By the end of World War I, New Hampshire had the largest percentage of French Canadians among the states.

The economy.   The historic shoemaking, woodworking, apparel, and textile industries have declined in productivity and employment, while space-age industries have grown rapidly. Among nonmanufacturing industries that also have grown significantly are public utilities, insurance and banking, medical and health service establishments, miscellaneous business services, and wholesale and retail trades. Tourism is also of major importance.

Agriculture, forestry, and fisheries.   Agricultural acreage has decreased by two-thirds in the 20th century. Dairy products are the chief source of agricultural income, followed by ornamental and greenhouse plants and a variety of fruits and vegetables. More than half of the timber harvested is used for sawlogs, and nearly 40 percent for pulpwood to supply paper and newsprint industries. The state ranks low in commercial fishing yields but has marketable catches of lobsters and deep-sea fish.

Industry.   Machinery and electrical- and electronic-goods manufacturing has largely supplanted the textile and garment industry, much of which either closed or moved to the South after 1945. Paper and wood products are the next largest industries. The only large industrial centre north of the White Mountains is Berlin, with large paper and pulp mills.

There are many rock quarries, chiefly of granite, throughout New Hampshire. Sand and gravel are the major minerals produced in terms of both tonnage and value. Other native minerals that have commercial value include garnet, zircon, beryl, and bog iron.

In 1955 the state legislature established an Industrial Park Authority, now the Industrial Development Authority, to attract more business into New Hampshire. Supplemented by the endeavours of individual cities and towns and by various private organizations, the authority has been successful in modernizing the industrial and business life of the state. An organized effort began in 1925 to publicize New Hampshire as a tourist area, and this effort has steadily expanded. With the increase in popularity of winter sports following World War II, New Hampshire became as attractive to visitors in the cold months as it had been in the summer.

Transportation.   The New Hampshire railroad network is now barely one-fourth its former length. Hundreds of miles of right-of-way have been abandoned, and there is no passenger service except on a six-mile cog railway on Mount Washington. The line opened in 1869 as the first construction of its kind in the world, and it is now used to carry tourists behind steam locomotives during the summer. As the railroad disappeared, the bus and highway systems of the state greatly increased. Several branches of the interstate highway system have given New Hampshire residents easy access to the major metropolitan areas of the Northeast. Regularly scheduled commercial air carriers serve airports in Keene, Lebanon, and Manchester; New Hampshire also has dozens of smaller landing strips for private planes. The transportation system as a whole makes it possible for many people to live in New Hampshire while working out of state and for the important tourist industry to function smoothly.

Administration and social conditions.   *Government.*   The constitution of New Hampshire, the second oldest among the 50 states, was adopted in 1784. Every 10 years the residents may vote on the question of holding a convention to consider modifications of the constitution. Proposals that pass these conventions must be approved by two-thirds of

the voters at a popular referendum. Several conventions have been held in the state's history, and a large number of modifications have been adopted, but a considerable portion of the original constitution remains intact.

The governor is elected for a two-year term and is assisted by a five-member executive council, a survival from the colonial era. Members, elected every two years from five geographic districts in the state, must approve most appointments to state offices and all appointments to judicial posts.

The state legislature, the General Court, comprises more than 400 members elected every two years. The lower body, the House of Representatives, has between 375 and 400 delegates, depending on changes in population. It is thus one of the largest legislative bodies in the English-speaking world. The state Senate has 24 members.

The state's judicial functions take place in three levels of courts: municipal and district courts, county superior and probate courts, and the state Supreme Court. All justices are appointed by the governor and executive council and serve during good behaviour or until they are 70 years old. The state police, in addition to their usual duties, are at the disposal of the governor for emergency assignments.

Counties, cities, and towns are the units of organization for government below the state level. The 10 counties have few nonjudicial functions. Each of the 13 cities has its own charter providing for a mayor–council, a council–manager, or a commission system of government. Virtually all the 221 incorporated towns rely on the annual town meeting to guide policy. Towns have a variety of elected and appointed committees, but those matters of general concern recommended by these advisory groups appear as articles in a warrant distributed before the town meeting. With an elected moderator presiding, the town votes on every article. It also elects a wide range of local officials. Elected selectmen, from three to five in number, manage daily affairs. In larger towns they are authorized to have a manager to assist them.

New Hampshire has an unusual system for raising revenue. The state has clung tenaciously to its distinction of having neither a general sales tax nor a comprehensive state individual income tax. Because it raises some money from dog and horse racing, from state-operated liquor stores, and from a lottery, New Hampshire has a reputation for relying on "sin" taxes. The state actually derives only a small portion of its revenue from these sources, however. Much more important are a business profits tax, license fees, and taxes on meals, lodging, and motor fuel. The state provides the standard health and social welfare services; the provisions, however, are not as extensive as in adjoining states. Administration of the welfare system rests primarily with the towns, as does the responsibility for financing public elementary and secondary education. Local property taxes provide the bulk of this financing. The entire tax structure became a matter of intense partisan dispute in the 1960s and '70s. State budgetary surpluses in the 1980s and the advantages of local financial control have silenced many critics of the current system.

New Hampshire has always been a two-party state. Prior to the Civil War, New Hampshire was overwhelmingly Democratic, but from then to the depression of the 1930s it was dominated by the Republicans. The voters, however, have opted on several occasions for Democratic presidential candidates—Woodrow Wilson, Franklin D. Roosevelt, and Lyndon B. Johnson—and have sent a number of Democrats to Congress.

Education.   New Hampshire has had a public school system since 1647, when, as a part of Massachusetts, it was required to provide different kinds of schools depending on community size. The statewide system is administered by a board of education headed by a commissioner. Each town is constituted a school district, with its main support coming from local property taxes. Towns frequently join to form consolidated public high-school districts. The land-grant college that became the University of New Hampshire was founded in 1866 in Hanover and moved to Durham in 1893. Affiliated colleges are located at Plymouth and Keene. There are several state vocational colleges and a technical institute; an educational television

(margin notes, left column)

French-Canadian population

Winter sports

(margin notes, right column)

Local government

system at the state university has been operated since 1959.

New Hampshire also has many private educational in-
stitutions. Phillips Exeter Academy and St. Paul's School
are the best known among the state's preparatory schools.
Colleges include Dartmouth, founded at Hanover in 1769,
St. Anselm (Manchester; 1889), and Colby-Sawyer (New
London; 1837).

Cultural life.   New Hampshire has several outstanding
cultural institutions. The MacDowell Colony, a retreat
for musicians and writers, was founded in 1907 and
is a memorial to the composer and Peterborough resi-
dent Edward MacDowell (1860–1908). The 86-acre (35-
hectare) former home of the noted sculptor Augustus
Saint-Gaudens (1848–1907) at Cornish was designated a
National Historic Site in 1964. The Currier Gallery of
Art and an institute of arts and sciences are located
in Manchester; Dartmouth College is a distinguished
fine arts centre, and there is an arts and science cen-
tre in Nashua. Several towns have smaller galleries, art
centres, and museums. Summer theatres flourish in a
dozen or more resort areas.

Recreation and tourism are important parts of the cul-
tural pattern of the state. New Hampshire has some 30
ski areas, many of which operate their lifts in the summer
for sightseers. There are more than 200 youth camps and
more than 70 golf courses. Historical sites throughout the
state include restored colonial homes and Fort Constitu-
tion at New Castle. There are more than 30 state parks
and more than 800,000 acres (324,000 hectares) of pub-
licly owned forest preserves.

American Indian population.   Before contact with the
English about 3,000 American Indians inhabited what
eventually became New Hampshire. They were organized
into clans, semiautonomous bands, and larger tribal en-
tities; the Pennacook, with their central village near the
town that bears their name, were by far the most pow-
erful of these tribes. The entire Indian population was
part of the linguistically unified Algonquian culture that
dominated northeastern North America. Disease, war, and
migration quickly reduced the population after contact
with English settlers. By 1700 few Indians resided within
colonial boundaries. The primary contemporary reminder
of American Indian inhabitation is in place-names like
Lake Winnipesaukee, Kancamagus Highway, and Mount
Passaconaway.

The English colony.   The New Hampshire region was
included in a series of grants made by the English crown
to John Mason and others during the 1620s. A fishing
and trading settlement was established in 1623, and in
1629 the name New Hampshire, after the English county
of Hampshire, was applied to a grant for a region be-
tween the Merrimack and Piscataqua rivers. The towns of
Dover, Portsmouth, Exeter, and Hampton were the main
settlements.

From 1641 to 1679 the region was administered by
the colonial government of Massachusetts. Following
territorial and religious disputes between Massachusetts
and Mason's heirs, New Hampshire became a separate
royal province in 1679. Bitter boundary feuds with Mas-
sachusetts and New York over that part of the New Hamp-
shire grant that became Vermont continued almost until
the American Revolution. Benning Wentworth held the
post of colonial governor from 1741 to 1767, the longest
tenure of any royal governor in any of the colonies.

In 1767 the colony took its first census and reported
about 52,700 people. By 1772 the state was divided into
five counties, to which five others have been added since
1800. New Hampshire soldiers played an active part in
the colonial wars between Great Britain and France from
1689 to 1763. By the end of the colonial period the seat
of government was at Portsmouth, and there were 147
chartered towns in the province.

Revolution and statehood.   In December 1774 there was
armed resistance to the British at New Castle, where Fort
William and Mary (now Fort Constitution) was seized
by colonists. The citizens of New Hampshire were over-
whelmingly in sympathy with the aims of the revolution-

ary leaders. The state furnished two brigadier generals to
the Continental Army, three regiments of regular troops,
and hundreds of short-term militiamen. New Hampshire
officially became a state in 1776 and issued its own Decla-
ration of Independence several weeks before the national
Declaration of July 4, 1776. New Hampshire's vote was
the ninth and decisive vote in ratifying the Constitution
of the United States in 1788.

Following the establishment of the nation, the state grew
rapidly. Agriculture, notably sheep raising, flourished, and
manufacturing developed along the fast-flowing rivers,
particularly in Manchester. When the railroads came to
the Northeast, an extensive rail network was constructed
in New Hampshire. Portsmouth and its surrounding towns
were shipbuilding centres. In 1846 Manchester became
the first incorporated city in the state. New Hampshire
was also the birthplace of such noted statesmen as Daniel
Webster and President Franklin Pierce.

Contributions to war and politics.   New Hampshire
played an active part in the American Civil War, and,
following that conflict, the state voted regularly for Re-
publican candidates until the New Deal of the 1930s. The
Progressive movement had an impact upon the state in
the early 20th century, and the economic depression of the
1930s left scars that were only slowly effaced. In World
Wars I and II and in the Korean and Vietnamese conflicts,
soldiers from New Hampshire played important roles, and
the shipbuilding and naval facilities at Portsmouth were
of special value.

Because it holds the earliest presidential primary in the
nation, New Hampshire has furnished the first testing
ground for many candidacies. In 1905 Portsmouth was
the site of the peace conference that ended the Russo-
Japanese War, and in 1944 the state was host to the
Bretton Woods Conference that founded the International
Bank for Reconstruction and Development and the Inter-
national Monetary Fund. The U.S. Air Force constructed
a huge Strategic Air Command base at Newington in
1957, and the Portsmouth Naval Shipyard, across the Pis-
cataqua River from Portsmouth in nearby Kittery (Maine),
has continued to specialize in building and repairing sub-
marines.   (J.D.S./J.R.D.)

Rhode Island

Rhode Island, one of the original 13 states and one of the
six New England states, is often remembered for being
the smallest state in the Union, only about 48 miles (77
kilometres) long and 37 miles (60 kilometres) wide. More
remarkable, however, are the state's contributions to the
forming of the new nation, of its concept of liberty of
conscience—the legacy of Roger Williams, its founder—
and of its influence on the industrial development of the
United States.

Rhode Island is one of the most densely populated states
in the nation. Providence, the founding settlement, is the
capital and the cultural, political, and financial centre of
the state. The extreme compactness of area, large popula-
tion, and economic activity have tied Rhode Island closely
to its neighbours, Connecticut on the west and Mas-
sachusetts on the north and east. The Rhode Island Sound
on the south is the basis of the state's fishing industry.

The land.   *Relief.* The western two-thirds of the state is
part of the New England Upland, with hills rising as high
as 800 feet (240 metres) above sea level. The Narragansett,
or Seaboard, Lowland comprises coastal lowlands and is-
lands that are less than 200 feet (61 metres) in elevation.
The highest point in the state is Jerimoth Hill, 812 feet
(247 metres), near North Foster.

Drainage. Several river systems drain Rhode Island.
The most important are the Blackstone, the Pawtuxet,
and the Pawcatuck. The Blackstone River and its tribu-
taries drain the northern part of the state. Originating in
Massachusetts, the Blackstone once provided waterpower
for the textile mills built at Woonsocket, Pawtucket, and
a dozen villages in between. The Pawtuxet River drains
the central part of the state. Its north branch was flooded

Margin notes:

Early
colonial
disputes

Role in
forming
the nation

when Providence built a dam at the village of Kent. The resulting Scituate Reservoir is now the state's largest body of fresh water, supplying Providence and its neighbouring communities. The Pawcatuck River flows west across the southern part of the state into Block Island Sound south of Westerly.

Narra-
gansett
Bay

Mount Hope Bay feeds water from Massachusetts into Narragansett Bay, which has always been Rhode Island's greatest asset, providing a convenient waterway running two-thirds the length of the state. The commercial trade on which the wealth of Newport, Bristol, and Providence was founded provided some of the capital for the industrial development of the state. There is now a large ocean-borne bulk commerce centred on the bay.

Soils. The state's soils are primarily glacially derived. In the western area many rocks and boulders lie on rolling land with outcrops of granite and gneiss. Better soils with fewer rocks are found in the lowlands and adjacent bay islands, where the soil base is sedimentary. Along the west side of Narragansett Bay and in river valleys, glacial out-washes of sand and gravel are rapidly drained.

Climate. The state has a humid continental climate, with winds predominantly from the west. Marine influences are discernible in differences between coastal and inland locations. The average monthly temperature in January is 29° F (−2° C), in July 71° F (22° C), and for the year 50° F (10° C). Annual precipitation is about 42 inches (1,067 millimetres). The major weather characteristic is variability, with extreme weather conditions including tropical storms, ice storms, and heavy snow. By 1980, 29 storms of hurricane force had struck Rhode Island.

Plant and animal life. More than 60 percent of the state is forested with secondary tree growth. White pine grows in scattered locations. Several varieties of oak are abundant and, with other hardwoods, form the bulk of the timber harvest. Ash, hickory, and maple are widely dispersed, with some birch and hemlock in mixed wood-lands. Swamp maple grows in wet places, while cedar, juniper, and poplar fill in abandoned fields and pastures. Favoured species of spruce, fir, and pine are grown on tree farms for commercial use.

Small animals such as rabbits, woodchucks, raccoons, gray squirrels, minks, and beavers are distributed widely outside urbanized areas. Foxes are less widely distributed, while white-tailed deer are found on Prudence and Block islands and in the western woodlands.

Settlement patterns. Rhode Island comprises five counties, eight cities, and 31 towns (townships). The major population centre is Providence and the nearby communities of Pawtucket, North Providence, Johnston, Cranston, Warwick, and East Providence. Warwick and Cranston are the state's second and third largest cities. Major clusters of population in Woonsocket, Newport, and Westerly are close to the state's borders.

Providence
and
other
cities

The people. Before the arrival of the British colonists, about 7,000 Narraganset Indians lived along the west side of the bay and islands, where they fished and farmed in summer and moved into the forest in winter. They spoke a dialect of the Algonquian language family, as did their neighbours, the Wampanoag to the east and the Niantic and Nipmuc. The Narraganset were detribalized in 1880 when they sold their communal land to the state. The Narraganset continued their traditions, however, and maintained a group registry, and in 1934 they incorporated and reorganized their internal government to include an elected chief and a council. A suit to reclaim their land, based on a 1790 statute that prohibited sales of Indian land without federal approval, was settled out of court in 1978 for about 1,800 acres. A petition for tribal status was recognized in 1983, but the Narraganset's endeavour to gain reservation status was refused in 1985. Tribal programs and financial compensation continued, however.

During the colonial era, most settlers were English Protestants, although some Irish, Huguenots, Jews, and blacks also arrived then. Irish Catholics began to come in large numbers in the 1820s, and they settled in Providence, Pawtucket, and Newport. The largest groups of French-Canadians came during the American Civil War; they were followed by small numbers of Scandinavians, Ger-

mans, Portuguese, and Cape Verdians. New arrivals settled first in the river valley mill villages; later immigrants settled in the cities. At the turn of the century, immigrants included eastern Europeans—Poles, Russian Jews, Ukrainians, and Lithuanians—and Greeks, Armenians, and Syrian-Lebanese. This was also a period of significant Italian immigration.

After World War II, blacks came from the South or from New York City, and Hispanics came from Puerto Rico, the Dominican Republic, Colombia, and Mexico. They were followed during the 1970s and '80s by Southeast Asians.

The economy. Since the mid-20th century, high taxes, high energy costs, and low wages have combined to keep the Rhode Island economy from expanding. In 1985 the state passed legislation to reduce the tax burden and overhaul unemployment and worker's compensation programs. In the same year, the legislature created the Business Action Center, a problem-solving agency designed to help businesses with their concerns.

Resources. The major resources of Rhode Island are human: muscles, skills, intellectual creativity, and an increasing mastery of technology. In addition, the forests have been used for centuries for fuel and lumber. The soils, where cleared of rocks, offer good potential for producing food. Reservoirs and groundwater provide drinking water and are important industrial resources. Narragansett Bay and the Atlantic Ocean provide food, transportation, and recreational opportunities.

Narragansett Bay has also attracted the U.S. Navy. The Naval War College has operated at Newport since 1884; the naval presence grew through World War II until the closing of the Quonset Point Naval Air Station and the reassignment of ships in 1974. The navy, however, has continued as the second largest employer in Rhode Island, after state government.

U.S. Navy
installa-
tions

Agriculture. Agriculture has decreased steadily in Rhode Island. The leading areas of agriculture are nurseries, lumbering, and harvesting turf. Dairy products and poultry are also important. Potatoes are the major field crop and apples the major fruit. In 1985 a bond issue was passed to buy up development rights and permit farmers to continue to farm; this is an endeavour to preserve rural areas and save a vanishing heritage.

Fishing. The most valuable shellfish landings are lobsters and quahogs (hard-shell clams). Finfishing takes place in Narragansett Bay, but more fish are caught offshore from Galilee, where a cooperative processing plant is located. Flounder, butterfish, whiting, scup, and cod are the main species. Despite larger trawlers and more technical equipment, yields have declined. Laws restrict fishing methods and the size and number of fish to be taken.

Industry. Relying in its early years almost entirely on subsistence agriculture and seaborne trade, Rhode Island became a pioneer manufacturing state, principally in textiles, after the American Revolution. Manufacturing concerns producing jewelry, silverware, electrical equipment, textiles, transportation equipment, and fabricated materials have given way in importance to the service industry (including tourism), wholesale and retail trade, government, finance, insurance, and real estate.

Transportation. Amtrak, Conrail, and the Providence and Worcester Railroad serve the state's rail needs. The major arteries for road travel are Interstate Highways 95 and 295 (the Providence bypass), which offer connections to cities in Connecticut and Massachusetts as well as between communities in Rhode Island. A limited-access connector road links I-95 to the state's main air terminal, T.F. Green State Airport, in Warwick. General aviation is also served by state airports at Smithfield, Newport, Westerly, Block Island, and Quonset.

The Rhode Island Port Authority and Economic Development Corporation operates port facilities for ocean-borne commerce at Providence and Davisville/Quonset Point. The port of Providence, at the head of Narragansett Bay, handles petroleum, automobiles, scrap iron, lumber, and steel. The Davisville/Quonset Point facility (formerly the Quonset Point Naval Air Station) is part of a large industrial park with rail and air connections.

Administration and social conditions. Atop the state capitol in Providence is the statue of "The Independent Man," a symbol of so much that is characteristic of Rhode Island. Roger Williams wrote that he had founded Providence as a place of refuge for "those distressed for cause of conscience," and the principle of absolute religious freedom has been an abiding article of Rhode Island's political philosophy.

Principle of religious freedom

Government. Rhode Islanders count their colonial charter (1663) as the first constitution. A new constitution, approved in 1986, replaced the 1842 constitution, which had been amended more than 50 times.

Ever since its founding, the state has shown a reluctance to permit elected officials to exercise extensive powers. In the early years legislatures and elected officials served for only six months. Prior to 1854 the state had five capitals—Providence, Newport, East Greenwich, Bristol, and South Kingstown—and the General Assembly traveled from one to another. In 1900 Providence was chosen as the sole capital.

Elected officials are the governor, lieutenant governor, secretary of state, attorney general, and treasurer, each serving unlimited two-year terms. The governor has veto power and the power to name certain department heads. The 150 members of the General Assembly (50 senators, 100 representatives) are paid by the day for 60 legislative days. Attempts to amend the state constitution to increase legislators' pay have been defeated by the voters.

The state has a district court system; superior courts; a Supreme Court, which also can give advisory opinions if requested; and municipal and probate courts, the latter often identical with the town council in the smaller communities. There is also a Family Court, which handles both juvenile and domestic cases. Supreme court judges are elected by both houses of the General Assembly sitting as a committee of the whole, and since the 1930s they have had tenure.

Most of the cities in Rhode Island operate with a mayor and city council form of government, but East Providence and Newport have city managers, with mayors chosen from among the councilmen to act as the ceremonial heads of the local government. Most of the towns are governed by a town council, but in some cases operations are conducted by a town manager. Some call an annual financial town meeting.

Rhode Island has a sales tax, which exempts food and prescription drugs. In 1971, after many defeats in the General Assembly, the state adopted a personal income tax. Lotteries were used widely in colonial times and after the Revolution to raise capital for civic improvements; they were prohibited later but were reestablished in 1974. A share of the state's income derives from its tax on pari-mutuel betting at the Lincoln Greyhound Track and Newport Jai Alai.

There are jails in cities and towns throughout the state, but most persons awaiting trial or sentenced to prison are sent to the state Adult Correctional Institutions (ACI) at Cranston. In 1975 the ACI adopted a work-release program to rehabilitate prisoners. Rhode Island has a strong state police force that operates throughout the state.

Education. In 1969 a Board of Regents was created and charged with responsibility over all public education, from elementary schools through the state-operated colleges and the university. In 1981 the board was divided into the Board of Regents for Elementary and Secondary Education and the Board of Governors for Higher Education. A number of private preparatory schools, both sectarian and nonsectarian, send graduates to many of the major colleges and universities, especially in the East.

Higher education

Rhode Island is strong in its institutions of higher education. Brown University in Providence, founded in 1764 as Rhode Island College, is one of the major Eastern universities that make up the so-called Ivy League. It is noted for its library facilities, especially the John Carter Brown Library of early Americana. The Rhode Island School of Design, in Providence (founded 1877), is widely known, primarily for its training in the visual and graphic arts. The University of Rhode Island, in Kingston, is a land-grant institution dating from 1888. Roman Catholic colleges

include Providence College (1917) and Salve Regina-The Newport College (1934) in Newport. Rhode Island College, a four-year public liberal arts college, dates from 1854. Other institutions include Bryant College (1863), Johnson and Wales University (1914), the New England Institute of Technology (1940), Roger Williams College (1948), and the Community College of Rhode Island (1960).

Health and welfare. Local communities are handicapped by limitations on property taxes as a major source of revenue. The state's capacity to raise taxes, however, has permitted it to play a significant role in establishing acceptable standards of support for municipal services. State funds subsidize teachers' pay, provide grants for school construction, protect public health, support the needy, aid dependents, and offer incentives for achieving specified goals in these areas.

The state maintains elaborate facilities to care for the sick and indigent of all ages. Rhode Island has a national reputation for deinstitutionalization of clients into group homes. A system of outpatient care and of referral for mental health patients is available.

Biomedical research has been important since the establishment in 1975 of the Brown University Program in Medicine, which operates a full biological science program. More than 350 laboratories support university research at hospital centres. The University of Rhode Island has a large biological sciences faculty and conducts research in pharmacology.

Cultural life. Library facilities are plentiful throughout the state. The Redwood Library, in Newport, and the Providence Athenaeum, both proprietary libraries housed in architecturally important buildings, have roots going back to the mid-18th century. The public libraries of Providence and Westerly have important holdings, the former having special collections on whaling, printing, slavery, and Irish literature. The library of the Rhode Island Historical Society, in Providence, has more than 1,000,000 manuscripts and is especially strong in its holdings of the state's genealogical records. The society operates John Brown House, a merchant's mansion in Providence; built in 1786, the house is furnished with masterpieces of the Newport school of cabinetmakers and with other 18th-century antiques. The Museum of Rhode Island History, Aldrich House, also run by the society, is a converted mansion that features changing exhibits.

The Museum of Art of the Rhode Island School of Design has impressive collections, including early Rhode Island furniture and silver. Roger Williams National Memorial (Providence), Slater Mill Historic Site (Pawtucket), and South County Museum (Narragansett) offer specialized insights into other aspects of the state's past.

Preservation of early homes

Preservation societies in both Providence (1956) and Newport (1945) restore and preserve surviving colonial homes, while the state Historical Preservation Commission is a major centre for research and publications. There are more than 11,500 Rhode Island properties listed on the National Historic Register. The Preservation Society of Newport County operates as museums several mansions that were formerly the summer homes of millionaires. The Newport Historical Society museum, with its fine collections; Touro Synagogue, a magnificent example of colonial architecture; Old Colony House; Redwood Library; Hunter House; the restored colonial homes of the Point section; and the International Lawn Tennis Hall of Fame and Tennis Museum in the Newport Casino building give Newport an extraordinary and varied cultural heritage.

The Rhode Island Philharmonic Orchestra, the Rhode Island Civic Chorale and Orchestra, the Community Chorus of Westerly, and numerous smaller groups and organizations are among the state's musical resources. Newport has an annual chamber music series, as well as several series featuring renowned soloists. Many of the restored houses in Newport are the setting for these performances, and jazz, modern, and folk festivals are held at Fort Adams. The State Ballet of Rhode Island performs throughout the state. The Trinity Square Repertory Company (1964), with its own home in Providence, is renowned for producing works by new playwrights, as well as for staging novel productions of classic works.

Many recreational activities are centred on the state's water. For many years the waters off Newport have been the site of the yacht races for the America's Cup. An annual tuna tournament is held in Rhode Island and Block Island sounds. Newport Casino, one of the early centres of tournament tennis, has an annual grass-court tournament of national importance.

HISTORY

Colonial period. The name Rhode Island owes its origin to the 16th-century Italian explorer Giovanni da Verrazzano, who compared the size of Block Island to the Mediterranean island of Rhodes. The earliest settlers thought that Verrazzano had referred to the island which the Indians called Aquidneck and thus began calling it Rhode Island.

In the state's official name—The State of Rhode Island and Providence Plantations—lies a clue to its founding. The first settlement was made by the minister Roger Williams and a few followers at Providence, near the head of Narragansett Bay, in 1636. They were either under edict of banishment from Massachusetts Bay colony— Williams for advocating freedom of conscience in religion—or were in trouble with the authorities there. In 1638 a group of Bostonians, in similar difficulties, purchased the island of Aquidneck, now Rhode Island, from Indians and settled Portsmouth. Factional strife split this settlement, and William Coddington and his adherents moved to the southern end of the island, where they founded Newport, leaving Anne Hutchinson and her followers in Portsmouth. In 1643 Samuel Gorton and a dissident group settled Warwick.

Williams went to England in 1643 and returned the following year with a royal patent for the colony, but the four towns could not agree on a form of government until 1647, when a loose confederacy was established. The colony was never accepted into membership in the United Colonies of New England—comprising Plymouth, Massachusetts, Connecticut, and New Haven—and it was constantly threatened with a takeover by these governments. Coddington, having himself made ruler for life of the island towns, split the colony between the mainland and the island towns. Williams and John Clarke, the latter representing island elements unhappy about Coddington's commission, sailed for England in 1651, succeeded in getting the commission rescinded, and in 1654 set up a

Sailboats at Watch Hill, R.I.

reunited government. Clarke remained in England and, in 1663, won a royal charter that was to be the basis of colonial and state government for 180 years.

Although the colony never officially joined the New England colonies in King Philip's War (1675–76), it suffered greatly. All mainland settlements were burned, including, in 1676, many houses in Providence. Most of the mainland settlers took refuge on Rhode Island, which was not attacked. The Great Swamp Fight, which broke the power of the Narraganset Indians, took place in December 1675 west of the present village of Kingston.

Rhode Island had commerce with the West Indies, selling horses, barrel staves, and salt fish. Eventually, some merchants plied the triangular trade: taking rum to the African coast, where it was traded for slaves; carrying the slaves to Charleston, S.C., or to the West Indies, where they were traded for molasses; and carrying the molasses to Rhode Island, where it was distilled into rum. The passage of the Sugar Act by Parliament in 1764 seriously restricted this trade, and the colony, never enthusiastic about obeying unpopular laws, began to indulge in smuggling of sugar and molasses. In 1772 the British customs vessel *Gaspee*, patrolling Narragansett Bay, ran aground off Namquit (now Gaspee) Point while pursuing a suspected smuggler; that night it was burned by a group of townsmen from Providence. This has been widely regarded as the first act of outright violence against the British crown in the period leading to the American Revolution.

Revolution and independence. During the war Newport was occupied by the British. In 1778 a land force under General John Sullivan and the French fleet commanded by the Count d'Estaing cooperated in an operation designed to dislodge them. Before the French troops could be landed, however, a British fleet appeared in the bay; d'Estaing halted the landing and set out in pursuit. Two days later, before the ships had actually engaged, they were dispersed by a storm. The American ground forces, lacking French assistance, were forced to retreat from the island. At Butts Hill they fought a strong rearguard action that became known as the Battle of Rhode Island and in which a battalion of freed slaves distinguished itself. A Rhode Islander, General Nathanael Greene, distinguished himself as Washington's second-in-command.

After the war Rhode Island was reluctant to ratify the Constitution until the Bill of Rights was proposed in the form of 10 amendments. The state's largely agricultural population was opposed to joining the Union, while the merchants of Providence and Newport worked hard for ratification. When threats of commercial isolation from the other states were raised, Rhode Island accepted the document in May 1790 by a margin of two votes.

Newport, preeminent before the war, lost much of its economic power during the British occupation, and Providence, led by such merchants as the four Brown brothers, John, Joseph, Nicholas, and Moses, assumed the leadership.

In 1842 a movement for widening the franchise, limited under the 1663 charter to freeholders and their eldest sons, resulted in a conflict known as the Dorr Rebellion. Led by Thomas Wilson Dorr, the son of an aristocratic family, the faction favouring universal suffrage held a convention in 1841 and adopted a constitution embodying this principle. At an election held under this constitution, Dorr was elected governor in 1842, but the election was not accepted as legal by the legislature or the state Supreme Court. When his forces were repulsed in an attempt to seize the arsenal in Providence, Dorr fled the state. Upon his return, he was tried on a charge of high treason, convicted, and sentenced to life imprisonment; he served only one year, however, and was released in 1845. By that time the state had adopted a revised constitution considerably broadening the basis of the franchise, but it was not until the mid-20th century that full rights to vote in all elections were extended to all citizens at the age of 21 (later 18).

In the years after the American Civil War the Republican Party, led by such political bosses as General Charles R. Brayton, dominated the state, mainly because the cities, which were increasingly Democratic, were not proportionately represented in either chamber of the General As-

Margin notes:

Early commerce with the West Indies

The Dorr Rebellion

sembly. Theodore Francis Green, a Democrat, was elected governor in 1932 and reelected in 1934. With the Democratic Party in power, a different prolabour domination followed. Of the 14 governors elected between 1933 and 1985, 10 were Democrats and four were Republicans. On the national level, Republicans Dwight D. Eisenhower, Richard M. Nixon, and Ronald Reagan carried the state.

A number of Rhode Island's concerns have become bipartisan in nature: improvements in the quality of drinking water and of the state's rivers and the bay, improved education, and the development of a stronger economy.

A new constitution was approved in 1986 that permits constitutional amendments after a majority vote in both houses of the General Assembly and a majority of those voting in a general election. Further, it provides a mechanism for voters to convene a constitutional convention on a regular basis at least once every 12 years.

(B.F.S./M.I.Wr.)

Vermont

Admitted as the 14th state on March 4, 1791, Vermont is one of the six New England states in the northeastern corner of the nation. Its 9.614 square miles (24,900 square kilometres) have relatively few inhabitants, and its capital, Montpelier, is one of the least-populous U.S. state capitals. On the south, Vermont borders Massachusetts; on the west, New York; and on the north, Quebec, Can. From the Canadian to the Massachusetts border, the Connecticut River separates Vermont from New Hampshire on the east. The river, from the mean low-water line on the western bank, is entirely within New Hampshire.

In many ways Vermont is a vigorous survivor of an earlier, simpler time in the United States. Millions of people visit the state each year, and many thousands of out-of-state residents maintain second homes in Vermont. These people primarily seek the beauty and tranquillity of Vermont's mountains and narrow valleys and the sense of the nation's past that pervades the entire state. The steeples of white wooden churches rising above small, mountainbound towns with trim village greens; the herds of dairy cattle on sloping mountain pastures; and the red-gold leaves of tree-lined autumnal lanes are aspects of scenic Vermont that, in painting and photography, have become symbols of the rural United States.

George A. Robinson—f/STOP Pictures

Cross-country skier near Cambridge, Vt., with Mount Mansfield in the background.

Many people left their birthplaces in Vermont to join the movement westward and to America's cities. In turn, many creative personalities have sought the spiritual refuge offered by the state. Vermont has never stood in the mainstream of the nation's history, but its people and land have poured into their country a strength and a sense of continuity that joins the achievements of the nation's past with the purposes of its present.

PHYSICAL AND HUMAN GEOGRAPHY

The land.   The land of Vermont does not have great variety, but in place of this it substitutes an intensity and pervasiveness of those features it does possess.

Relief.   The Green Mountains that cover most of the state are a northeastward extension of the Appalachian Mountains that run from Canada into northern Alabama. They provide Vermont with a north–south backbone that ranges from 20 to 36 miles (32 to 58 kilometres) in width. Thirty-one mountains in the state rise to more than 3,500 feet (1,100 metres), and most of this tilted landscape is rocky with thin topsoil. Only 15 percent of the state's terrain, mostly in the Champlain Valley, is level land with fertile soil and high productive capability. Vermont's average altitude is about 1,000 feet above sea level. Mount Mansfield, at 4,393 feet (1,339 metres), is its highest point; and Lake Champlain, at 95 feet (29 metres), is its lowest. On the Vermont–Massachusetts border, the northern end of the Hoosac Range enters the state, and the Taconic Range rises along the southwestern side. North of the Taconic Range are the Red Sandrock Hills, which extend along Lake Champlain to St. Albans. **The Green Mountains**

Drainage.   These ranges are broken by only a few river valleys, such as the Winooski, Lamoille, and Missisquoi, all flowing westward into Lake Champlain. Part of the Missisquoi turns north through Canada before returning to Vermont. Lake Champlain's waters empty northward into the Richelieu River and flow 80 miles into the St. Lawrence. The longest river entirely within the state is the Lamoille (84 miles), followed by Otter Creek (75 miles), which rises in southwestern Vermont and flows northward into Lake Champlain. Several small streams, the largest of which is the White River, flow from the central highlands into the Connecticut River. The western portion of Lake Champlain is in New York; and 75 percent of Lake Memphremagog, the second largest lake associated with Vermont, lies in Canada. The largest of the 400 natural lakes entirely in Vermont is Lake Bomoseen (2,395 acres).

Climate.   Snowfall in Vermont usually averages between 70 and 80 inches (1,800 and 2,000 millimetres) in the valleys and up to 110 inches in the mountains. Total annual precipitation varies from 34 inches in the eastern and western sections to more than 40 inches in the mountains. Winter temperatures can drop to −34° F (−37° C) and lower, but in the summer they rarely rise above 90° F (32° C). Pleasant summer days often turn cool after nightfall. The annual growing season is only about 120 days—somewhat longer in the low-lying Champlain Valley—because frost usually comes in September and may strike as late as the beginning of June. The short growing season and rocky soil make dairying the dominant form of commercial farming. About 80 percent of farm income comes from dairy products. The state has more cows per capita than any other state except Wisconsin. **Rainfall and temperature**

Plant and animal life.   A century ago many of Vermont's hilltops had been cleared as pastures and open fields. As farmers abandoned the hillsides, the open spaces quickly filled with trees. Pine, spruce, fir, and hemlock are common; maple and birch are among the deciduous trees. The state tree is the sugar maple, which reflects Vermont's prominence in maple sugar and syrup production. The wooded areas, with their small brooks and springs, produce an amazing variety of ferns and wildflowers; in the spring and summer they are filled with the many species of birds common to the Northeast.

Vermont has a huge deer population, and deer hunting is an autumn ritual. Bears are often seen, but wild members of the cat family are rare. Small animals abound in Vermont, and fishing in the lakes and streams, including ice fishing in winter, is popular.

Cities and
towns

Settlement patterns. Most Vermonters live in valley cities and towns. Burlington, in the Champlain Valley, is Vermont's largest community, followed by Rutland, in the Otter valley; Bennington, in the Walloomsac valley; and Essex, near Burlington. The Green Mountains were long a barrier between eastern and western Vermont, and judgeships and political candidates often were chosen to balance an eastern and western sectionalism. Although regional division is now a minor factor, some observers detect it emerging between southern and northern Vermont, presumably a reflection of the south's influx of newcomers and resort developments. Others sense a dichotomy involving small towns and large towns, which revolves around such public issues as state constitutional reforms, welfare aid, and educational innovations. Three isolated northeastern counties have been known since 1949 as the "Northeast Kingdom." Pragmatically, however, the major sense of regionalism is derived from large towns, which form a centre for surrounding rural areas.

The people. Because so many Vermonters are descended from early Americans of Protestant background and English heritage, the people of the state are almost prototypical Yankees. There is scarcely a town in Vermont that does not have a white frame church on its village green or main street. Virtually every Protestant sect is represented in Vermont, with a heavy concentration of Presbyterians in the Caledonia county area of northeastern Vermont. The name Caledonia, the Roman designation for northern Britain, was brought by the Scottish immigrants who first settled the region in the 1770s.

In 1848, when railroads were first built in Vermont, a large number of Irish immigrants were hired as labourers. Many of their descendants live today in Rutland, Burlington, St. Albans, and other large towns. During the 1900s French Canadians from Quebec province settled in the state, many of them in the woolen-mill town of Winooski and others on farms along the northern border. Almost 10 percent of all Vermont residents speak French as their first language. Immigrants from northern Italy carried with them centuries of quarrying and stone-carving tradition to Barre and other granite-producing areas. They have given Barre a character quite different from what the visitor expects to find in a Vermont city. Other quarry workers from northern Spain settled in the Barre–Montpelier area. Many Welshmen worked in the slate mines of western Vermont because they were familiar with this type of mining in their native land. Immigrants from Poland sought work in Brattleboro, Springfield, and other manufacturing towns. The slight need for industrial labour, and the rural character of the state, have attracted few blacks from the nation's South, and they number less than one-half of 1 percent of the population. The Roman Catholic diocese of Burlington includes all of Vermont, and Roman Catholics make up about one-third of Vermont's total population.

Famous
emigrants

Vermonters continue their long-standing pattern of leaving the state in order to find employment elsewhere. This tiny state has produced many leaders of American business and political life. John Deere, for example, designed the plow that cultivated the fields of the Midwest; Frederick Billings built the Northern Pacific Railway; Joseph Smith and Brigham Young led the Mormon church; and Gurdon Saltonstall Hubbard was the first meat-packer in Chicago. Presidents Chester A. Arthur and Calvin Coolidge were born, respectively, in Fairfield and Plymouth, and both parents of President Rutherford B. Hayes were Vermonters who migrated to Ohio. The Taft family, famous in U.S. statesmanship, traces its Ohio origins to Vermonter Alphonso Taft, who left Townshend and settled in Cincinnati.

The economy. Farming has declined as family farms have been combined into larger units, and an increasing number of farmers, unable to modernize their equipment and expand their herds, have sold their lands. Labour is not generally well organized in the state.

Industry. Vermont's approximately 1,000 manufacturing plants reflect national industrial trends. Machine-tool plants in Springfield tend to expand and retract along with the national economy. The St. Albans area in Franklin county especially has suffered from the decline of the

railroad industry, but the state as a whole has one of the highest employment percentages in the nation. Textile mills were once major employers in many cities, such as Winooski, but many of these have closed or moved to the South. Some computer industries have moved into Vermont. Other Vermont firms have become subsidiaries of national firms. The state's Agency of Development and Community Affairs searches constantly for new industry, while an industrial park authority offers site guidelines.

Many Vermont industries are small companies that provide specialized products. Wood and paper products are natural for a state so heavily timbered, and about one-third of Vermont's manufacturing plants make bowls, hockey sticks, furniture, and paper of different kinds. Printing is among the major industries.

Mining. Extractive industries contribute significantly to Vermont's economy. Quarries in Barre are among the largest granite pits in the world; and marble from Proctor is used for constructing commercial and public buildings—examples include the U.S. Supreme Court building in Washington, D.C., and the United Nations headquarters in New York City. Slate quarries operate along the Vermont–New York border.

Tourism. Vacation resorts, motels and hotels, and related services employ thousands of Vermonters to serve the many tourists that visit the state each year. Skiing facilities at Stowe, Dover, Sherburne, and the Mad River valley are among the many Vermont winter resorts that attract people from throughout the Northeast. During the summer, visitors hike mountain trails, search through antique shops, study exhibits in the many museums, attend musical and dramatic performances, or bicycle or drive through the state and take photographs. The travel information office of the Agency of Development and Community Affairs is active in promoting tourism, and its *Vermont Life* magazine depicts the state's scenic resources.

Attractions for visitors

Transportation. Passenger service ceased on Vermont's railroads in 1966 but was resumed on a limited basis by Amtrak in 1971. Airline service is limited in southern and central Vermont, but the airport at Burlington is one of the busiest in New England. The major transportation arteries are north–south routes in the Connecticut River valley and the lowland valley south of Lake Champlain. Interstate highways link Vermont with Massachusetts, New Hampshire, and Quebec province. Elsewhere, roads are often winding, narrow, and hilly, following the contours of the land. None of these factors is conducive to industrial expansion, and transportation remains a major problem.

Administration and social conditions. *Government.* On July 8, 1777, Vermont adopted a constitution, the first in the United States to prohibit slavery. It was revised in 1786, and in 1793 the present constitution was adopted. The amending process is awkward, and amendments may be considered only once every four years. Voters are required to take a "freeman's oath," a holdover from colonial America, and to be "of a quiet and peaceable behavior."

The governor of Vermont is elected for a two-year term and may run for reelection. Members of the General Assembly also serve two-year terms; the House of Representatives has 150 members, and the Senate 30. Vermont has only one member in the U.S. House of Representatives.

The judicial system in Vermont is headed by the Supreme Court, which has five members. Below it are 10 Superior Court judges and 15 district judges. These judges are appointed by the governor and confirmed by the state Senate to serve six-year terms. All other judges, including two assistant judges in each county, are elected by the people.

Every year on the first Tuesday in March, voters throughout the state meet in their town halls or community buildings to debate the town budget, road maintenance, and other topics and to elect local officials for the coming year. Because most communities are small and the state is compact, Vermonters have fairly direct access to elected officials, as well as ample opportunities to voice their opinions publicly on dominant issues.

Vermont has traditionally been one of the most Republican states in the Union, but since the 1960s a balance between the two major U.S. parties has developed in state politics.

Republican tradition

Education. In view of its limited tax base, Vermont supports its schools commendably. Locally elected boards, encouraged by the state, govern all primary and secondary education. The state provides for much of the funding, for teacher training and certification, and for various special programs in such areas as vocational training, arts and crafts, and rehabilitation.

The state system of higher education includes the University of Vermont (chartered in 1791) in Burlington and a number of liberal arts, technical, and other colleges. In addition, there are several outstanding private colleges and a law school in South Royalton. The school of languages and the writers' workshops at Middlebury College (1800) in Middlebury and Bread Loaf in Ripton are internationally known. Bennington College (1925), primarily a women's college, is known for its fine arts programs and for the major figures in the arts who regularly serve on its faculty. Marlboro College (1946) is noted for its work in the performing arts and for its summer music festivals. Norwich University (1819) in Northfield is the nation's oldest private military college.

Health and welfare. There is a state mental hospital at Waterbury; the state also maintains facilities for the mentally retarded. Vermont's correctional system includes five regional detention centres and facilities for juvenile offenders. In 1969 the state assumed responsibility for administering welfare programs, which formerly had been supervised by an "overseer of the poor" in each town.

Cultural life. Vermont enjoys a vigorous cultural life despite its rural and small-town character. Many artists and scholars have followed such famous literary figures as Sinclair Lewis, Pearl Buck, Robert Frost, and Robert Penn Warren in maintaining vacation homes in the state. Painters find inspiration in the landscape, and sculptors adapt old materials and forms from barns and antique shops to contemporary uses. Among the galleries in Vermont are the Robert Hull Fleming Museum at the University of Vermont, the Southern Vermont Art Center in Manchester, the Springfield Art and Historical Society in Springfield, the Chaffee Art Gallery in Rutland, the Wood Art Gallery in Montpelier, and the Johnson Art Gallery at Middlebury College.

Folk arts   Practitioners of various folk arts are numerous, and the state operates an arts-and-crafts service augmented by the Vermont Museum and Art Gallery Alliance. The Vermont Council on the Arts and the Vermont Historical Society often sponsor demonstrations by artists and craftsmen. Vermont has a rich heritage of folk music. In warm weather Vermont is vibrant with music and drama, including the annual Marlboro Music Festival and the Mozart Festival in Burlington. The Craftsbury Chamber Players attract large audiences to Hardwick. Summer theatre is popular in Stowe, Winooski Park, Weston, Dorset, and elsewhere in the state. The Vermont State Symphony Orchestra was the first in the nation to receive a legislative appropriation. The University of Vermont sponsors cultural events in Burlington and other communities, and lectures, films, and concerts are offered frequently by Vermont's other colleges and universities.

Vermont is proud of the way it preserves its heritage. The Shelburne Museum is called "The Museum of the American Spirit" because its historic buildings on 45 acres (18 hectares) contain a wealth of early artifacts. The Bennington Museum contains the oldest preserved Stars and Stripes carried in battle, a collection of the primitive-style paintings of Grandma Moses, and specimens produced by the large Bennington pottery industry. In Montpelier the Vermont Historical Society has created a museum inside a reconstructed Victorian landmark on the statehouse green. The Fairbanks Museum and Planetarium in St. Johnsbury is famous for its natural history displays. The Billings Farm Museum in Woodstock and the Ethan Allen Homestead in Burlington are popular attractions. Vermont has nearly 150 local historical societies and statewide groups, such as the Vermont Archaeological Society and the Lake Champlain Maritime Society.

Vermont maintains more than 100 covered bridges, most of which were constructed before 1912 and are protected by state law. A state division for historic preservation

maintains almost 70 historic sites, including the Bennington Battle Monument, the Old Constitution House at Windsor, and the birthplace and family homestead of Calvin Coolidge at Plymouth. The State House in Montpelier is considered the state's most important historic site.

HISTORY

Exploration and settlement. The first inhabitants of Vermont were Indians of the Abnaki tribe who hunted wild animals and traveled on the waterways and footpaths of the region. In 1609 the French explorer Samuel de Champlain discovered a lake there to which he gave his name. The first permanent European settlement was established by the French in 1666 on Isle La Motte, an island in northern Lake Champlain. The name Vermont, derived from the French *vert* and *mont* ("green mountains"), was applied to the region because of the thick coniferous growth that kept its mountains green year-round. During the late 17th and early 18th centuries, Vermont served as a route for French and Indian incursions from Canada into Massachusetts.   *French exploration and settlement*

In 1724 the Dutch established a community in Pownal, and the first English-speaking settlers erected Fort Dummer on the Connecticut River near present-day Brattleboro. When the British won the French and Indian War (1754–63), the land was opened to settlement. At the time the American Revolution began in 1775, about 20,000 people were living in Vermont. Many Vermont towns bear the names of the Connecticut and Massachusetts towns from which the early settlers came.

Revolution and statehood. Although the region was explored long before the landing of the Pilgrims and was settled before the American Revolution, it began its early development not as a chartered royal colony but as a territory, the possession of which was disputed by New Hampshire and New York. In the decades before the Revolution, disputes—frequently armed conflicts—arose when land grants by New Hampshire conflicted with similar grants issued by New York. Between 1770 and 1775, many early settlers joined units of the Green Mountain Boys, led by Ethan Allen, and repulsed the Yorkers who tried to control Vermont. Later, when the American Revolution began, the same Green Mountain Boys also asserted their independence from England. Their successful assault on Fort Ticonderoga, on the New York side of Lake Champlain in May 1775, has been called the first offensive action of the Revolution. In 1777 the Vermonters created an independent republic—first as New Connecticut, then as Vermont—and they remained independent until they joined the Union on March 4, 1791.

Vermont grew from about 85,500 inhabitants in 1790 to about 218,000 in 1810; but, by the 1830s, Vermonters were departing in large numbers for the expanding cities and the more fertile lands to the south and west. The opening of the Erie Canal from Albany, N.Y., to Lake Erie in 1825 and later improvements in transportation hastened this emigration. More than 35,000 Vermonters fought in the American Civil War. Vermont became the site of the only Civil War action north of Pennsylvania when a band of Confederates raided St. Albans in October 1864. Many veterans left Vermont after the war because the state provided inadequate natural resources to power industrialization and urbanization and because greater opportunities for individual advancement were available elsewhere. The rural character of the state was thus assured, and today Vermont is the most rural state in the United States, with two-thirds of its people living in towns of 2,500 residents or fewer.   *Growth in the early 19th century*

Modern period. After the Civil War, dairying began to replace sheep farming, and the state's hill farms were gradually abandoned. The election of 1856 gave control of Vermont to the new antislavery Republican Party, a dominance that lasted until the 1960s. In the 1930s the first ski runs were built, which led, by the 1960s, to the development of a winter tourist industry. During this time many small manufacturing plants set up operations in the state, and much of the hill country was opened to vacation home development. Despite these changes, Vermont has retained much of its earlier character.   (C.T.Mo./D.G.Sa.)

MIDDLE ATLANTIC REGION

Delaware

The first of the original 13 U.S. states to ratify the federal Constitution, Delaware occupies a small niche in the Boston–Washington, D.C., urban corridor along the Middle Atlantic seaboard. With 2,045 square miles (5,295 square kilometres), it is the second smallest state in the nation and one of the most densely populated. Its population, like its industry, is concentrated in the north, around Wilmington, where the major coastal highways and railways pass through from Pennsylvania and New Jersey on the north and east into Maryland on the south and west. The rest of the state comprises the northeastern corner of the Delmarva Peninsula, which it shares with Maryland and Virginia. Dover is the capital.

Historically, geographically, and economically, Delaware has its closest ties with Pennsylvania, particularly Philadelphia, where the Delaware River and other transportation arteries direct its commerce. The state's three counties—New Castle, Kent, and Sussex—had been established by 1680. Stability and conservatism have become characteristics of Delaware, especially in the southern areas, which until 1964 maintained a grip on political life vastly out of proportion to their population. As a result, old institutions have been tenaciously preserved.

The manufacturing complex in the north makes Delaware one of the most industrialized states, especially notable for chemical research. The state is often depicted as being dominated by corporations, especially by the vast du Pont industrial empire, but until the mid-1960s the industrial wealth of the Wilmington area was balanced by the political overrepresentation of the agricultural downstate region. All factions have united to perpetuate liberal incorporation laws that encourage many American businesses to make Delaware their nominal home state.

PHYSICAL AND HUMAN GEOGRAPHY

The land. *Relief.* With the exception of Florida, Delaware, located mainly within the Atlantic Coastal Plain, is the lowest-lying state in the nation. A long sand beach forms the state's oceanfront, stretching from the

Kevin Fleming

Brandywine Creek flowing through the Piedmont in northern Delaware.

Maryland line, at Fenwick Island, to Cape Henlopen, at the mouth of Delaware Bay. Only one major break, Indian River Inlet, occurs along the 23-mile (37-kilometre) length of the beach. Much of the beach is a low bar between the ocean and a series of lagoons or shallow bays, but at Bethany Beach, near the southern boundary, and again at Rehoboth, near the northern end of the beach, the mainland reaches directly to the ocean.

Much of the shoreline of Delaware Bay is marshy. The mouths of tributary streams like the Murderkill, the Mispillion, and the St. Jones are so shallow that only fishing boats find safe harbours north of Lewes. Farther north, on the banks of the Delaware River, spots of high, dry land appear, as at Port Penn, New Castle, and Edge Moor; the state's main port, Wilmington, lies on the Christina River, a tributary of the Delaware.

Most of Delaware is drained by streams that run eastward to the Delaware River, Delaware Bay, and the Atlantic Ocean, but the Nanticoke River and its tributaries in southwestern Delaware flow into Chesapeake Bay. So does the Pocomoke River, which drains the Cypress Swamp, or so-called Burnt Swamp, in the extreme south of Delaware, athwart the Maryland line.

Most of the Coastal Plain is fertile and level, seldom more than 60 feet (18 metres) above sea level, but it becomes increasingly sandy to the south. Abundant woodlands, streams, and freshwater ponds interrupt the monotony of the landscape. Occasionally, as at Odessa, villages appear suddenly at the side of the road, with no more warning than the sight of a church steeple.

Near its northern edge the plain is intersected by the Chesapeake and Delaware Canal, which has been deepened and straightened for ocean shipping. It shortens the water route between Philadelphia and Baltimore by several hundred miles and also brings Baltimore closer to the ocean than via Chesapeake Bay. The canal is popularly considered to be the boundary between agricultural downstate Delaware and the northern industrial region. Though the land on either side of it is similar, many Delawareans are convinced that even the weather changes at the canal.

Several high bridges over the canal, the giant twin bridges crossing the Delaware River north of New Castle, and the refinery stacks at Delaware City are the major landmarks on the horizon below the northwestern corner of the state, where the rolling hills of the Piedmont extend south from Pennsylvania. Within this area—less than $^1/_{15}$ of the state's total area—and at its edge dwells most of Delaware's population. The highest point in the state, Ebright Road in New Castle county, is only 442 feet (135 metres) above sea level. Peculiar features are Iron and Chestnut hills, which protrude into the plain southwest of Newark and are scarred by open pits where iron ore once was mined.

The centre of Wilmington lies on hills sloping downward toward the confluence of the Christina and its major tributary, the Brandywine. There, navigable water brought shipping close to falls that provided power for manufacturing. The railroads and highways, which followed this fall line along the east coast, have kept Wilmington on major transportation routes between Philadelphia and Baltimore and have promoted the tendency for the urbanization of open land between Wilmington and other cities.

Climate. The climate of Delaware is humid and temperate. The average daily temperature at the New Castle County Airport in northern Delaware is 54° F (12° C), varying from an average high of 86° F (30° C) in July to an average low of 23° F (−5° C) in January. Temperatures in southern Delaware usually run about two degrees higher than these figures. August, which has the second hottest temperatures after July, is also the rainiest month, with an average precipitation of about 5.5 inches (140 millimetres), whereas February has the least precipitation, an average of almost three inches. The annual average precipitation is nearly 45 inches (1,140 millimetres).

Plant and animal life. Delaware is a transition zone between plants typical of Pennsylvania and New York and

Chesapeake and Delaware Canal

those common to coastal Maryland and Virginia. Hardwoods are characteristic in the north, but pines become mixed with hardwoods in the south. Deer, foxes, raccoons, opossums, and muskrats are common. Beaches and marshes are a winter refuge for many wildfowl, as well as a stop on the migratory paths of such birds as sandpipers.

Settlement patterns. After 1945 the suburbs of Wilmington, largely unincorporated, received not only the people fleeing Wilmington but also most of the white newcomers to Delaware. More than half of the state's population lives outside the city of Wilmington but within commuting distance of it. This suburban band includes Delaware's second largest city, Newark. Thus, suburbia has become the seat of Delaware's population, political power, and wealth. Suburban areas are populated generally by whites, although there are a few black enclaves.

Though federal laws reduced the flow of immigrants after World War I, Delaware experienced its largest population growth in the middle of the 20th century. From 1950 to 1960 its population grew by about 40 percent, but the rate declined thereafter. Many of the newcomers were highly skilled scientists or technicians. Wilmington also received a large influx of blacks, many of them unskilled.

The people. As is characteristic of the Middle Atlantic states, the colonial population of Delaware was quite varied. Swedes (and the Finns who came with them), Netherlanders, and African slaves settled in Delaware before the English, mainly in present-day New Castle county in the north. The English settlers came not only from overseas but also from Pennsylvania and Maryland. Some of the settlers from Pennsylvania were Quaker artisans and merchants; the settlers from Maryland were often planters who brought slaves with them. With the English came some Welsh settlers and, after 1715, large numbers of Irish, particularly the Presbyterians of Scottish descent known as Scotch-Irish. Downstate Delaware was settled mainly by the English and by slaves.

After the Revolution a small group of French came to New Castle and Wilmington from the West Indies, and a few, including the progenitors of the du Pont family, came from France. In the mid-19th century there was a large immigration of Germans and Roman Catholic Irish, and at the end of the century Italians, Poles, and Jews came in large numbers, accompanied by smaller groups of Ukrainians, Russians, Scandinavians, and Greeks.

Ethnic groups in rural Delaware include Polish potato growers in Kent, who came from Long Island; Italian mushroom growers at Hockessin; a colony of Finns that originated at Iron Hill after World War I; an Amish settlement near Dover; and the historic groups of mixed-bloods, called Moors and Nanticokes, at Cheswold, in Kent county, and beside Indian River Bay, in Sussex county. In the mid-20th century there was an influx of Latin Americans, mainly Puerto Ricans, who settled in Wilmington, as had the first generation of the earlier immigrants.

The economy. Delaware's prosperity depends upon its favourable location: four of the 10 largest cities in the United States lie within 150 miles (240 kilometres) of Delaware.

Agriculture. Though the number of farmers continues to decline, agriculture remains important. Most of the farmers' cash income comes from poultry raising, centred in Sussex county. The soybean crop continues to be important, and other major agricultural products include corn, milk, and vegetables. The coastal and inland waters produce fish, clams, and crabs. The only mining is of gravel and sand.

Industry. The major economic enterprise in Delaware is manufacturing, especially the chemical industry. Wilmington boasts of being the chemical capital of the world because it is the centre of administration and research of several chemical companies; du Pont, Hercules, and ICI Americas (formerly Atlas) are the largest. Chief chemical products are pigments, nylon, and petrochemicals. Delaware also has automobile-assembly plants, a petroleum refinery, a synthetic rubber plant, packaging plants, textile mills, and various food-processing plants.

Delaware has made a business of incorporating companies, many of which operate primarily in other states, since early in the 20th century. It offers them favourable laws (frequently revised to reflect changing business conditions), a convenient location, moderate taxation, stable institutions, and a judicial system with experience in corporate litigation. The corporation franchise tax is an important source of state revenues.

Transportation. The chief flow of highway traffic in Delaware is between Wilmington and its suburbs and the interstate traffic crossing northern Delaware between New York or Philadelphia and Baltimore or Washington. Slightly less important is the traffic up and down the state on the du Pont Highway. The state maintains all roads and bridges as well as through streets in municipalities. A joint Delaware–New Jersey agency operates both the twin bridges across the Delaware River near New Castle and a ferry between Lewes and Cape May.

Delaware lies on the railroad passenger line between Philadelphia and Baltimore. Freight service is also available to the southern state line and in northern Delaware. Local bus transportation in the Wilmington area is provided by a public authority. Wilmington is a major port along the Atlantic seaboard and is the site of the state's largest airport.

Administration and social conditions. *Government.* The constitution of Delaware, its fourth, was adopted in 1897 but has been amended many times. Amendments require a two-thirds vote in two successive legislatures, with an election intervening. The governor, who has no veto on amendments, serves a four-year term and may be re-elected only once. Traditionally, the legislature has been strong and the governor relatively weak, but adoption of the cabinet form of government in 1970 centralized and strengthened executive authority. The 62-member bicameral legislature is known as the General Assembly.

An unusual feature of Delaware's judicial system is the retention of the Court of Chancery, which handles equity cases involving civil rights and litigation concerning Delaware corporations. Most other states have merged their chancery into their law courts. The highest court is the Supreme Court, which hears appeals from the Chancery Court and the Superior Court. At the lowest level in the state judiciary are the magistrate courts, presided over by justices of the peace, who seldom are lawyers. All Delaware judges are appointed by the governor.

Weak county governments have been the rule in Delaware. Formerly, each was headed by an elected levy court that set the tax rate and appropriated funds. The levy courts of New Castle and Sussex, however, have been replaced by stronger elected councils, and New Castle also elects a county executive who appoints the chief administrative officers. Delaware is notable for having used the county subdivision known as a hundred, an ancient English governmental unit. It no longer has a governmental function and is retained purely as a geographic name.

Because of Delaware's small size, many things are done by the state that elsewhere would be left to local government. Consequently, state taxes and indebtedness are relatively high, whereas local equivalents are low. The largest source of state income is the tax on personal and corporate incomes. There is no general sales tax and no state property tax. Real estate taxes are the chief support of county and municipal governments. Schools are supported chiefly by the state, but school districts must raise part of the money for new buildings and school operations, including salaries, through property and other taxes, which must be given approval in a referendum.

Democrats and Republicans have been fairly evenly matched in Delaware, although the Democrats have the larger number of registered voters. Many voters decline to list party preference, and numerous swing votes may go to either side. Primaries had little significance until 1978, when they were first used for all offices.

After the American Civil War, Delaware Democrats used their control of such offices as assessor and tax collector to discourage blacks from qualifying as voters, but Republicans sought the black vote and, with its aid, won control of the state early in the 20th century. In 1932 the Democrats abandoned their all-white tradition. At first

Margin notes:

Early immigration

Chemical industry

Role of state government

they won black votes only for the national ticket, but gradually, during the next two decades, Delaware's blacks, like those in other Northern states, realigned themselves with the Democratic Party. Thereafter, only an exceptionally popular Republican won black support. Bipartisan support was largely responsible for passage of a fair-housing law.

Education. The University of Delaware, established in 1833 as Newark College, has grown from 1,500 students in 1952 to about 20,000 students. A small population makes a medical school too expensive, but the state has arrangements with Jefferson Medical College of Philadelphia to save places in each class for Delaware students. Similar arrangements are made for students in fields such as veterinary science and dentistry, in which no training is offered in Delaware's public institutions. The state government assumes the major responsibility for public education.

Health and welfare. The state has been called upon to provide an increasing number of services for its citizens. The demands for expenditures, especially in education and welfare, have been brought on partly by population growth and immigration of young families with children and partly by recognition of long-ignored needs. Kindergartens, schools for the handicapped, and mental health clinics have been established.

Major museums

Cultural life. Two major museums are located in the outskirts of Wilmington. The Henry Francis du Pont Winterthur Museum and Gardens is noted for its collection of American decorative arts, which are displayed in authentic period rooms. The Hagley Museum portrays the development of American manufacturing through preservation of the early mills and other structures of the du Pont company, as well as by indoor exhibits. Other interesting museums include the Delaware Museum of Natural History, Greenville; the Delaware State Museum, Dover; and the Old Town Hall, Wilmington.

A number of historic houses in the state are permanently open to the public, including the John Dickinson Mansion, near Dover; the Parson Thorne Mansion, in Milford; and several houses in Odessa and New Castle. Several blocks in New Castle surrounding the colonial capitol, known as the Old Court House, remind visitors of the restorations of colonial Williamsburg in Virginia—except that in New Castle very few buildings had to be restored. Immanuel Episcopal Church, on the Green, was begun in 1703; its graveyard contains numerous interesting stones. The Presbyterian Church nearby dates from 1707. No buildings survive from the Dutch period. Old Swedes Church in Wilmington was built in 1698 for a Swedish Lutheran congregation, but it is now Episcopalian. The Swedes brought a tradition of log construction to the New World, but none of their work remains except perhaps portions of a few small log structures.

The state's foremost research library is that of the University of Delaware. Among the specialized libraries, the Hagley Library, featuring business and industrial history, and the library division of the Winterthur Museum, specializing in the decorative arts and crafts, are internationally known. The Wilmington Free Library is the largest unit in the consolidated New Castle county library system. The Delaware State Library Commission serves the lower counties; most towns also support a library of their own.

Wilmington long has been known as a centre associated with a distinguished group of illustrators, many of them pupils, either directly or indirectly, of Howard Pyle, whose work is displayed at the Delaware Art Museum. N.C. Wyeth, a pupil of Pyle, made his home just across the Pennsylvania line at Chadds Ford, which members of his family have made famous as the home of the Brandywine school, a group of mainly genre and narrative painters.

Performing arts

Wilmington has a legitimate theatre, the Playhouse, as well as the Grand Opera House, restored as a state centre for the performing arts. The professional Delaware Theatre Company has its own building in Wilmington. The small village of Arden is remarkable for its theatrical traditions, both amateur and professional, which include annual productions of Gilbert and Sullivan operettas.

Delaware's ocean beaches are popular not only with Delawareans but also with people from neighbouring areas, especially Washington, D.C. Rehoboth and Indian River

bays are boating, fishing, and clamming centres. State parks, such as Lum's Pond, are also used for recreation. The week-long Delaware State Fair is held annually in Harrington. Pari-mutuel betting lures crowds to racetracks in Stanton, Dover, and Brandywine Hundred.

HISTORY

The Indians. When the first Europeans arrived, the Delaware (or Lenni Lenape) Indians lived in northern and central Delaware and also along the river shore in Pennsylvania and New Jersey. Their language was a version of the Algonquian tongue. Politically decentralized (each village ran its own affairs), they were a peaceful people, supporting themselves by farming, hunting, and fishing. The more warlike Minqua, or Susquehannock, living to the west, frequently attacked the Lenape. Several Algonquian-language tribes, such as the Nanticoke, Assateague, and Choptank, lived in southern Delaware.

The colony. The Dutch who established the first European settlement in Delaware at Lewes in 1631 were killed by Indians, and it was not until 1638 that a permanent settlement was planted—by Swedes at Fort Christina, now Wilmington; they reputedly erected America's first log cabins in this colony of New Sweden. The Dutch from New Amsterdam (New York) conquered the Swedes in 1655, and the English seized the colony from the Dutch in 1664. Thereafter, except for a brief Dutch reconquest in 1673, Delaware was administered as part of New York until 1682, when the Duke of York ceded it to William Penn, who wanted it so that his colony of Pennsylvania could have access to the ocean. Though Penn tried to unite the Delaware counties with Pennsylvania, both sides resented union. In 1704 he allowed Delaware an assembly of its own. Pennsylvania and Delaware shared an appointed governor until the Revolution. Only in 1776 did the name Delaware—deriving from Sir Thomas West, 12th Baron De La Warr, a governor of Virginia—become official, though it had been applied to the bay in 1610 and gradually thereafter to the adjoining land.

Revolution and statehood. During the Revolution, Delaware was invaded by a British army en route to Philadelphia and was constantly menaced by British ships. The event best remembered, however, is the spectacular ride (July 1–2, 1776) of Caesar Rodney from his home to Philadelphia to break a tie in the Delaware delegation and cast Delaware's vote for independence. The proudest boast of Delaware is that its speedy ratification of the Constitution, on Dec. 7, 1787, gave Delaware its right to be called "the first state."

19th-century political sentiments

As national political parties arose, Delaware became a Federalist state, adhering to the party of Alexander Hamilton and John Adams well into the 1820s. In the next period Delaware became as fervently Whig as it had been Federalist.

Civil War and aftermath. The advent of the Civil War did not seriously tempt Delaware to secession. Delaware had been slave territory since its days as a Dutch colony, but the number of slaves had declined drastically, mainly through voluntary manumissions, from 8,900 in 1790 to 1,800 in 1860. More important was Delaware's economic bond with Pennsylvania and the North, strengthened by the river trade and the new railroad network. Though Unionist in sentiment, Delaware never voted for Lincoln, and the Reconstruction that followed the Civil War drove many voters to the Democratic Party in sympathy with the occupied South. By the end of the 19th century, however, economic realities had regained importance, and Delaware became firmly Republican and remained so until well into the Great Depression of the 1930s.

Economic growth. Delaware's principal city, Wilmington, became a manufacturing city, and by 1920 it contained not only half of the state's population but also at least a similar proportion of its wealth and economic energy. Diversity characterized the products of Wilmington factories, but in the 20th century the city became renowned as an administrative centre for the nation's chemical industry. In the 1980s, after Delaware lifted the limit on interest charges, many major banks from New York City and elsewhere set up subsidiaries in the state. (J.A.Mu.)

District of Columbia

For coverage of the District of Columbia, see the *Macropædia* article WASHINGTON, D.C.

Maryland

One of the original 13 states of the United States, Maryland lies at the centre of the Eastern Seaboard, astride the great industrial–population complex that stretches from Maine to Virginia. Its small size—10,460 square miles (27,092 square kilometres), about 6 percent of which is water, excluding Chesapeake Bay—belies the great diversity of its landscapes and of the ways of life that they foster: from the low-lying and water-oriented Eastern Shore and Chesapeake Bay area, through the metropolitan hurlyburly of Baltimore, its largest city, to the forested Appalachian foothills and mountains of its western reaches.

Maryland is thought to have been named in honour of the wife of King Charles I by a grateful Cecil Calvert, Lord Baltimore, who in 1632 was granted a charter for the land as a haven in which his fellow Roman Catholics might escape the restrictions placed on them in England. A deep sense of history is notable in the quiet charm of Annapolis, its capital since 1694, and in the white-domed, pillared statehouse, built in 1772, the nation's oldest statehouse in continuous use. Annapolis' 40-block Colonial Historic District contains more pre-Revolutionary structures than any other U.S. historic district. The narrow, crooked streets of Annapolis, the houses abutting directly on the brickwork sidewalks, the graceful tree-covered green about the statehouse, and the myriad masts of boats at dock or anchor in the harbour reflect more an earlier America than a state geared to the latest in technology.

Geography, too, has provided Maryland a role in U.S. history, as a pivot between the North and the South. Its northern border with Pennsylvania is the famous Mason and Dixon Line, drawn in the 1760s to settle disputes between the Penn and Calvert families and traditionally regarded as the boundary between the North and the South. To the south much of the boundary with Virginia is formed by the Potomac River, a symbolic barrier during the Civil War. On the north bank of the Potomac lies the District of Columbia, coterminous with the city of Washington, a small enclave ceded by Maryland in 1791

Pivot between North and South

Kevin Fleming

Maryland State House in Annapolis with the U.S. Naval Academy, the Severn River, and Chesapeake Bay in the background.

for the site of the national capital. East of the Chesapeake, the Eastern Shore shares the Delmarva Peninsula with Delaware on the north and Virginia on the south. In the mountainous west Maryland's panhandle, which is joined to the rest of the state by a narrow waist, interlocks with the eastern panhandle of West Virginia.

PHYSICAL AND HUMAN GEOGRAPHY

The land. *Relief.* The Atlantic Coastal Plain covers about one-half of Maryland's land area, yielding to the Piedmont Plateau at a fall line running from the northern tip of the District of Columbia through Baltimore and to near the northeastern corner of the state. The Catoctin ridgeline in the west forms the gateway to the Appalachians.

To the south the Coastal Plain is sandy; to the north it is loamy and fertile. Its water edges, called salt marshes, or wetlands, exasperate mapmakers as erosion periodically fills in a swamp or deletes an entire island: Blakistone, for example, is about one-tenth its 1634 size. The Chesapeake's 23 estuarial tributaries provide the state with some 3,200 miles (5,150 kilometres) of shoreline—subject to frequent change. The most important of nature-made revisions was an irruption of the ocean, during a storm in 1933, through Fenwick Island into Sinepuxent Bay, just below Ocean City. The lower portion of this barrier sand reef is now a national seashore and state park known as Assateague Island, and the inlet has become a boon to Ocean City's resort fishing fleet.

The Piedmont Plateau has good farming soil except for belts of clay that are mined for brick kilns; from the beginning, the exteriors of Maryland buildings have glowed with salmon-coloured brick made from the state's clay. To the west and parallel to the fall line, the low Parr's Ridge forms a barrier between the Potomac and Chesapeake Bay.

Maryland's share of the Appalachian Mountains comprises a series of forested barriers, with many of the intervening valleys still uncleared. Backbone Mountain, hugging the West Virginia line, is the highest point in Maryland, at 3,360 feet (1,024 metres).

The most salient feature of Maryland's topography is Chesapeake Bay, which serves the port of Baltimore and divides the Eastern Shore from what was once called Maryland Main. On a summer weekend as many as 100,-000 sailboats and powerboats may be seen on the water. But the bay has drawbacks. Swimmers shun its brackish, murky water after the late-summer onset of billions of small, stinging jellyfish, and the cross-bay bridges are often filled to capacity with the crush of summer weekenders going to and coming from the ocean beaches.

Chesapeake Bay

Dredging is necessary to maintain the 50-foot ship channel to Baltimore and to the Chesapeake and Delaware Canal. The bay must also be protected against pollution by the municipalities, industries, and farms in its drainage area. The bay was once lined with oysters, but silt, pollutants, and hostile microorganisms have pushed the beds up into tributary rivers and diminished the yield even there. The largest catch is the blue crab, which arrives on a dinner table in such delectable forms as crab soup, crab cakes, steamed hard-shell crabs, soft-shell crabs, and crab imperial. The bay, which was called by the Baltimore sage H.L. Mencken a "great big outdoor protein factory," still affords a precarious living to hundreds of watermen.

Climate. Maryland has two climates. It is continental in the west, with temperature records from −40° F (−40° C) to more than 100° F (38° C). In the east a humid subtropical climate is dependent on the Azores High (a pressure area that moderates the weather but does not prevent ice formation almost every winter on Chesapeake Bay's northern tributaries), with summer calms as high as 107° F (42° C), and nearly 100 percent relative humidity. Ordinarily, rains are enough to make reservoirs overflow and to enable Baltimore and Washington, D.C., to draw all the soft water needed for drinking. Storms sweep in from the west and south, except in late summer, when the fringes of passing hurricanes often drench Maryland from the east.

Settlement patterns. Sectionalism within Maryland is dictated by terrain. The Eastern Shore farmers concentrate
on chickens, corn (maize), and soybeans; the factory-style output of broilers (young chickens) is immense. A mercantile appendage of Wilmington and Philadelphia until the bay was bridged, the nine-county Shore has become a vacation and retirement spot for the affluent, who appreciate the privacy of its flat, wooded, little-posted estate areas serpentined with creeks, coves, guts, necks, and inlets.

Southern Maryland's five counties have built a way of life around state government, tobacco growing, military installations, and, increasingly, residential areas for Washingtonians. Thus, Prince George's county, almost one big suburb, has become Maryland's most populous county.

Central Maryland comprises the city of Baltimore and five counties. Four of the counties contain most of Baltimore's suburbs; the fifth is Montgomery, on Washington's northwestern edge. Only about one-sixth of Marylanders live outside metropolitan areas—and central Maryland is one long, contiguous metropolitan area.

The four counties of western Maryland owe much to road, railroad, and canal builders. The barging of coal and grain ceased in 1924, but the creation of the Chesapeake and Ohio Canal National Historical Park in 1971 assured a stream of excursionists. Interstate and national roads carry city dwellers to Garrett county, where mountainside ski runs complement water sports on Deep Creek Lake, the largest man-made body of water in the state.

The people. The white population, at first all from the British Isles, began to vary when German-speaking farmers and artisans moved from Pennsylvania into western The Maryland during the 1700s. The process accelerated in the ethnic mix 1840s during Ireland's potato famine and as Germans and German Jews fled military conscription, and then Russian Jews, Poles, Czechs, Italians, Greeks, and others arrived at Baltimore, which was a major 19th-century immigration centre, and later fanned out into the countryside. Ethnic diversity was one of the first characteristics that set Maryland apart from the regions below the Potomac River. Immediately after the American Civil War, this diversity of the state was countered by an influx of Southerners who despaired of life in a defeated and devastated homeland.

Maryland's Indian population had been killed off or pushed westward by about 1700. All that remains from their centuries of occupancy are campsite artifacts, still being unearthed; some impressive bayside oyster middens; and place-names, corrupted by uncomprehending whites, such as Chesapeake, Patapsco, Potomac, Wicomico, Patuxent, Piscataway, and Susquehanna.

African slaves were at work in Maryland under the first Calverts. The consciences of many Marylanders, particularly members of the Society of Friends (Quakers), were uneasy; from 1783 the importation of kidnapped Africans was heavily taxed. While Maryland did not formally outlaw slavery until 1864, it protected the liberty of more free blacks than any other state as slavery neared its end. After the Civil War, blacks found Maryland more congenial than the states of the Confederacy, in which, by 1900, systematic lifetime disfranchisement of blacks was under way. A similar effort in Maryland, led by the Democratic Party and coming to a head in 1910, was beaten in referendum by Republicans. Yet it took a U.S. Supreme Court decision in 1934 to force the University of Maryland to admit a black into its School of Law; and it was 1970 before Marylanders sent a black representative to Congress. The latter reflects in part the changing population of Baltimore, which now is more than half black.

The heaviest concentrations of population are centred around Washington, D.C., and Baltimore. Although the rural stretch between the two cities—only 40 miles apart—has been diminishing, the growth outward from the cities has been uneven, and thus a fusion into a common, uninterrupted cityscape has not occurred.

One attempt to fill in the Washington–Baltimore gap Planned is the planned, nationally watched city of Columbia, in city of Howard county. Although it had been created only in the Columbia mid-1960s, Columbia was by the 1980s home to 70,000 people of an intended 100,000 or so. It is governed by a private association rather than an elected government. A community not only of cars and shopping malls but also with ample greenery and other amenities, Columbia is

slightly closer to Baltimore, yet a majority of its residents work in or near Washington, D.C.

Baltimore is the largest city in the state, but it continues to lose people to the suburbs. Calculations for the next largest cities are impeded by the tendency of municipalities not to incorporate; thus, boundary lines are drawn arbitrarily by census takers.

The economy. Service businesses pervade the economy, and agriculture directly supports only a small number of people. The state has taken an increasing interest in the well-being of the private sector, particularly through its Department of Economic and Community Development. The agency encourages outside firms to locate in Maryland, promotes tourism, and keeps a close watch on the economy of the state.

Industry and agriculture. The major industries are primary metals, electronic and electrical equipment, transportation equipment, food and kindred products, and printing and publishing. Most large establishments are branches of out-of-state corporations, but wages for production workers are slightly above the national average. Electricity is generated at a nuclear plant at Calvert Cliffs; coal mining, in contrast, has ebbed. Maryland has one category of nationwide preeminence: crabs. The state's crab haul consistently surpasses that of other states. Saltwater staples also include other shellfish, as well as perch, flounder, and other finfish.

Transportation. Maryland offers the traveler from the north three trunk highways into Baltimore and four highways south to Washington, D.C. It is possible to swing around Baltimore and Washington on beltways or to avoid them altogether by Eastern Shore routes. The Harbor Tunnel Thruway and Francis Scott Key Bridge provide routes across Baltimore's harbour.

Amtrak provides passenger rail service to Baltimore, and residents of Montgomery and Prince George's counties commute to Washington, D.C., on the Metro subway. Baltimore, too, has built a Metro subway between Owings Mills, a northwest suburb, and downtown. Baltimore–Washington International Airport is augmented by numerous public airports throughout the state. For freight shipments, the port of Baltimore has excellent facilities and is one of the nation's busiest ports. The port, supervised by a state agency, is especially adapted to bulk commodities, container shipments, and foreign-made automobiles.

Administration and social conditions. *Government.* In spite of a provision for statewide voting every 20 years on whether to summon a constitutional convention, repeated attempts to scrap the 1867 document, with its unnecessary detail, obsolete concerns, and silence on points of modern interest, have been failures. The document has been amended some 200 times.

The form of state government in Maryland is like that of most other U.S. states. The governor, who serves for four years, may be reelected to an immediately succeeding Executive, term only once. A 1969–72 reorganization of the state legislature, government brought together in 12 departments several and hundred separate agencies, boards, and commissions. judiciary

Members of the General Assembly serve four years and may be reelected indefinitely. Reorganization in the 1960s ended rural domination of the legislature and passed power to the counties adjoining Baltimore and Washington, D.C. The General Assembly consists of the Senate, with 47 members, and the House of Delegates, with 141 members.

Below the seven-member Court of Appeals, the highest judicial body, is an intermediate Court of Special Appeals and echelons of circuit, district, and other courts. Judges are appointed by the governor and must run against their records (and, in Baltimore alone, circuit court judges must run against anyone filing in opposition) in the election following appointment. Appeals judges are elected to 10-year terms, and circuit judges to 15-year terms.

To avoid the greater costs that would be entailed by incorporation as governmental bodies, many of Maryland's most populous areas remain unofficial entities, their services provided on a countywide basis. A constitutional amendment allows home rule for counties, under special charter. A charter county is governed by a county executive and county council, both elected to four-year terms;

the council is empowered to enact all local laws. Eleven mostly rural counties are still governed by elected boards of county commissioners. The city of Baltimore, a separate jurisdiction, is run by an elected mayor and city council and a mostly appointive Board of Estimates.

In the 20th century, although free of the intimidation, poll tax, and other evils practiced in some places in the South, many Maryland elections have been machine dominated. The larger group of voters consistently has registered as Democrats, and the Democratic Party usually, but not always, wins. Exceptions have occurred when the Democrats split internally, when a nominee's platform was considered extreme, or when a Republican presidential candidate carried the local candidates. A Republican nominee can expect to do well in the western counties, one or two southern enclaves, the Eastern Shore, and some affluent parts of suburban Maryland. Baltimore, with its party-boss tradition, is a Democratic stronghold, and college-educated and consciously ethnic voters are dependably Democratic. The black vote, long staunchly Republican, switched parties during the New Deal of the 1930s.

The General Assembly remains heavily Democratic, as it has been for decades. Thus, Democratic primary elections are often more important than the general election. When the nation's axis of balance was North–South, numerous presidential nominating conventions assembled in Baltimore, but none has been held there since 1912. In 1969 Marylanders chose their first Jewish governor, in 1970 their first black congressman, and in 1986 their first woman U.S. senator. All were Democrats.

Through its revenues, largely derived from an income tax, federal aid, retail sales taxes, and a lottery, the state has assumed responsibilities that are no longer within the capacity of the local government. The state pays all full-time judges; the governor appoints the police commissioner of Baltimore; a state committee approves the construction of all public school buildings; and the state and the city jointly operate Baltimore's airport. The state provides annual subsidies to Baltimore's leading orchestra, art museum, public library, and resident theatre. In many instances, as population and industry have moved outward, as old structures have been demolished and property tax assessments and yield have dipped, municipalities have taken the initiative in this transfer of responsibilities to the state.

Education. Control of public education in Maryland is vested in a state board of education, a board of higher education, and Baltimore and county school boards. All positions are appointive, except in 10 counties where board members are elected to office. State supervision and the support of county public school systems began in 1870, but not until 1951 were 12 years of schooling uniformly required in all counties of the state. The state supports local systems, particularly as regards library services, vocational and rehabilitational instruction, and utilization of federal aid.

There are two-year community colleges in Baltimore and in several other locations. Crowning the state's system of higher education is the University of Maryland, with its main campus in College Park and branches located in Baltimore, Catonsville, and Princess Anne. The university's origins date from the College of Medicine of Maryland (opened in 1807) and Maryland Agricultural College (1856). The several graduate and undergraduate schools of the University of Maryland were consolidated in 1920, and in enrollment it has become one of the nation's largest universities.

Maryland has several private institutions of higher learning. The most prominent of these are Johns Hopkins University (founded 1876), with several campuses, a world famous medical school, and the Peabody Institute, a music school; the U.S. Naval Academy (1845) in Annapolis; St. John's College (1784) in Annapolis, noted for its emphasis on the great books of the Western world; Goucher College (1885) in Towson; and the Maryland Institute, College of Art (1826), in Baltimore.

Health and welfare. The Department of Health and Mental Hygiene, in addition to supervising county services, provides hospital therapy and care for alcoholism,

drug abuse, mental retardation, mental illness, and other afflictions. The department is also active in preventive medicine, for instance, providing programs of education against drug abuse. The state's Shock Trauma Center at University Hospital in Baltimore conveys the severely injured from anywhere in the state by helicopter within one hour for immediate life-saving treatment.

The Department of the Environment is the centre for state efforts to prevent or reduce pollution. It monitors the state's water supply and sewage, air quality, and solid-waste disposal.

The Department of Human Resources is in charge of state welfare activities. Direct aid to families with dependent children is its largest outlay, followed by general public assistance and foster care.

Cultural life. Maryland has its share of such nationwide phenomena as institutional uniformity, ebbing respect for local and regional distinctiveness, and transitoriness of residence, and such problems as graffiti, smog, illiteracy, unwed teenage parenthood, drunken driving, and street crime. The setting includes considerable decay, particularly in residential neighbourhoods; the garish commercialization of streets and highways; the urban waste spaces where torn-down buildings have not been replaced; and the degradation of the slums—some of them rural.

At the same time, however, the high proportion of Marylanders who are long-time residents (some represent many generations) retain an unusual number of distinctive interests and activities. Echoes of landed gentry of England and of early Maryland are stirred by riding to hounds in pursuit of the fox and taking part in the Grand National Steeplechase and Maryland Hunt Cup races, by breeding Chesapeake Bay retrievers, and by jousting on horseback with a spear at rings dangling from a crossbar. The outdoors looms large in the life of Marylanders. Popular activities in the state include sailing and crabbing on the bay, trolling for ocean marlin, shooting wild ducks and geese in the marshes of the Shore, playing the game of lacrosse (derived from an Indian sport), beachcombing for fossil shark teeth at Calvert Cliffs, exploring mountain caves, and hiking the 38-mile (61-kilometre) stretch of the Appalachian Trail across Maryland in a single day.

Sailboat and sports-car racing attracts both participants and spectators. Audiences that extend beyond Maryland's borders are drawn to the horse racing at Laurel and Pimlico (notably the Preakness, which is run in May), Baltimore's baseball team, the Orioles, and Washington's ice hockey and basketball teams, both based in Prince George's county. Restaurants present a plethora of cuisines, but the traditional gastronomy of Marylanders tends to be centred on terrapin soup, steamed crabs, padded oysters, fish and crab cakes, and beaten biscuits, often washed down with Maryland rye and beer. In almost a different world are the tiny communities of watermen located on various islands of Chesapeake Bay, in which isolation has worked to preserve distinct attitudes and ways of life.

Among Marylanders who have made major contributions to artistic and intellectual traditions are the critic H.L. Mencken, the black abolitionist-statesman Frederick Douglass, the antislavery activist Harriet Tubman, the philanthropists George Peabody, Johns Hopkins, Enoch Pratt, and Henry Walters, and, in the 20th century, the novelists Anne Tyler and John Barth and the filmmakers Barry Levinson and John Waters.

Baltimore is the centre of much of the state's activity in the arts. It is the home of the Baltimore Symphony Orchestra and of several professional theatres, including the Morris A. Mechanic Theater, Center Stage, Theatre Project, and numerous suburban dinner theatres. The Baltimore Museum of Art, Walters Art Gallery, Maryland Historical Society, City Life Museums, National Aquarium, U.S. Frigate *Constellation,* Maryland Academy of Sciences, B&O Railroad Museum, Baltimore Streetcar Museum, and Baltimore Museum of Industry (all in Baltimore city) are supplemented by galleries and display centres elsewhere, as well as by fairs and festivals. The most notable among them is the Maryland State Fair, which takes place in late summer at the State Fairgrounds in Timonium, north of Baltimore. Tourists throng to Bal-

timore's Inner Harbor year-round. Developed mostly in the 1980s, the Inner Harbor is a waterside array of high-fashion stores, new hotels, performances, moving boats, docked ships, and venues for eating and drinking.

HISTORY

The area's earliest human occupation is accepted as having been by roving hunters in about 10,000 BC, as the ice sheet made its final retreat. The records of this pre-Archaic, fluted-blade culture, which left only the points of its weapons, remain imprecise. Later, the numerous Eastern Archaic and then Woodland Indian populations practiced agriculture and feasted on seafood; by AD 1000, permanent villages were established. During the early European settlement the tribes were Algonquian in language and politics, but they were under pressure from the Iroquois to the north. The English promise of support in these wars greatly smoothed relations in the early colonial years.

The colony. Leonard Calvert, the younger brother of Lord Baltimore, landed the founding expedition on St. Clement's (now Blakistone) Island in the lower Potomac in March 1634. The first settlement and capital was St. Mary's City. Aware of the mistakes made by Virginia's first colonists, Maryland's settlers, rather than hunt for gold, made peace with the local Indians and established farms and trading posts, at first on the shores and islands of the lower Chesapeake. The field hands included indentured labourers working off the terms of their passage and, after about 1639, African slaves. The most important crop was tobacco. Roads and towns were few, and contact with the English-model manor houses was largely by water.

Religious toleration in the colony
The religious latitude stipulated by the Calvert family was formalized by the General Assembly in 1649 in an Act Concerning Religion, later famous as the Act of Religious Toleration. It granted freedom of worship, though only within the bounds of Trinitarian Christianity. Commercial disputes with Anglican Virginia and boundary quarrels with Quaker Pennsylvania and Delaware did not affect this tolerance. Puritan ascendancy in England (1648–60) caused only brief turmoil, and during an interval of crown rule in Maryland (1692–1715) the Church of England was formally established. Maryland nonetheless remained a haven for dissidents from sectarian rigidity in other colonies.

As the population centre shifted to the north and west, the capital was moved to Annapolis, and in 1729 Baltimore was founded. Maryland's dominant "country party" early resisted British efforts to make the colonies bear more of the costs of government. Frederick county repudiated the Stamp Act in 1765, and in 1774, the year after the Boston Tea Party, a ship loaded with tea was burned at an Annapolis dock.

Marylanders took an active part in the American Revolution. The Continental Congress, often on the move to avoid British troops, spent a winter in Baltimore. At the close of the war it convened in Annapolis, where it accepted George Washington's resignation from the army and ratified the Treaty of Paris (1783), which acknowledged the independence of the colonies.

Postwar problems included the disposition of confiscated loyalist property, the struggle for paper money, and debtor relief. Maryland's controversy with Virginia over the use of the Potomac and lower Chesapeake Bay, resulting in the Compact of 1785, led toward the Constitutional Convention, as did the Annapolis Convention of 1786, at which Maryland was not represented. Luther Martin distinguished himself as a representative of Maryland at the Philadelphia Convention of 1787. Maryland ratified the Constitution on April 28, 1788, the seventh state to do so. It also ceded territory and advanced money for public buildings to help form the District of Columbia (1791).

The state. When harassment on the high seas and other factors brought on the War of 1812, Baltimore clippers, sailing as privateers, dealt more than equal punishment to British skippers. In 1814 the British troops who had burned the principal government buildings in Washington, D.C., were repulsed in their attempts to inflict similar punishment on Baltimore. Francis Scott Key, a Georgetown lawyer and an eyewitness of the futile bombardment

of Fort McHenry in Baltimore harbour, wrote the four eight-line stanzas that, set to existing music, became the national anthem, the "Star-Spangled Banner."

With peace, Maryland and the nation occupied themselves with improvements in transport and communication. The National Pike, the first road to cross the Appalachians, was completed in 1818 and was followed by the first U.S. passenger railroad, the Baltimore & Ohio, and two canals, the Chesapeake and Ohio from Washington to Cumberland and, across the top of the Delmarva Peninsula, the Chesapeake and Delaware. The nation's first intercity telegraph line was constructed between Washington, D.C., and Baltimore. In 1845 the U.S. Naval Academy was founded on the Severn River in Annapolis.

Impact of the Civil War
The Civil War, however, arrested Maryland's progress. Landed gentry and residents of the Eastern Shore supported the secessionists, while workingmen and western Marylanders stood up for the Union; a third faction favoured neutrality. Federal troops occupied Baltimore and Annapolis, and martial law was imposed in this border state. Confederate armies mounted three major invasions in successive summers; they were checked at Antietam, they met full defeat at Gettysburg, in Pennsylvania, and their threat to Washington, D.C., was dissipated in 1864. The constitution of 1864 abolished slavery and removed power from the rural aristocracy. The more cautious constitution of 1867 remains in force.

Since 1865. After the Civil War Maryland prospered. The state was first an important entrepôt for raw materials from and consumer goods to the South and Midwest and became a growing centre of industry that rarely was controlled from within the state. Excesses that had won Baltimore the epithet "mob town" gradually were quieted. For many decades, until the mid-1900s, Marylanders consistently voted for Democratic candidates. Increasingly, however, the character of Maryland began to change because of its proximity to the seat of national government. The state became a major centre for federal installations, both military and civilian, during World Wars I and II and afterward—most famously, it found itself home to the presidential weekend retreat called Camp David, on Catoctin Mountain. But most important was the radically different face of the Maryland suburbs of Washington, D.C., which reflected change not only in the greater numbers of people but also in their unusually high educational and economic status.

When the nation took its first census, in 1790, the centre of population was found to be in Maryland. That site has long since moved far to the west. But Maryland remains, for all its lack of size, as close to a median or model for the whole 50 states as any other state can claim to be. (Ja.H.B.)

New Jersey

One of the original 13 U.S. states, New Jersey is bounded by New York on the north and northeast, the Atlantic Ocean on the east and south, and Delaware and Pennsylvania on the west. The state was named for the island of Jersey in the English Channel. The capital is Trenton.

Although it has major social, economic, and political force in its own right, New Jersey is often looked upon as a stepchild among the heavily industrialized and populated Eastern Seaboard states of the United States. Only four states in the nation have a smaller area than its 7,787 square miles (20,169 square kilometres), and only a few states have a larger population. Nonetheless, as a geographic entity and as a human collective, New Jersey suffers from a lack of identity among U.S. states. For the hundreds of thousands of its citizens who commute to New York and Pennsylvania, New Jersey is a vast bedroom state. Its transportation system, one of the busiest and most extensive in the world, is primarily a funnel for goods and people moving to New York City and other points north and to Philadelphia and Delaware and to points south. For hundreds of thousands of visitors it offers long stretches of fine beaches along the Atlantic Ocean, and the resort of Atlantic City may be better known than the state itself.

Above all, New Jersey is rife with contradiction and anomaly. Its people fiercely fight off attempts of state government to end home rule by powerful municipal administrations, which have contributed heavily to the almost uniform depression and decay of its cities. Whereas it has produced some of the most able and respected U.S. governors in the 20th century, its local politics have often been astonishingly corrupt, and it has achieved notoriety as a major haven for organized crime.

New Jersey is called the Garden State because it was famous for its fertility in the 18th century; it is now also among the most urbanized and crowded of states. The urban density of its northeast contrasts sharply, however, with the rugged hills of the northwest and with the enormous stretches of pine forest in the southeast and the rolling and lush horse country in the south central part of the state. New Jersey is an important industrial centre, but it has paid the price in environmental pollution, in dirt and noise, and in congested roads and slums. In sum, New Jersey is a curious amalgam of the urban and rural, the poor and wealthy, the progressive and backward, the parochial and cosmopolitan. Indeed, it is one of the most diverse states in the Union.

PHYSICAL AND HUMAN GEOGRAPHY

The land. *Relief.* New Jersey comprises four distinct physical regions: the Ridge and Valley section of the northwest, where the folded Appalachians slice across the state; the New England section, a southern extension of the ancient rocks of New England, which also trend across the state in a northeast–southwest direction; the rolling central Piedmont, where many of the major cities and suburbs are located; and the relatively level Atlantic Coastal Plain, which is divided into an inner and an outer portion. It is in the Outer Coastal Plain, with its relatively poor, sandy soils, that the Pine Barrens are located. The best soils are located on the Inner Coastal Plain and on the Piedmont and in valleys in the New England section south of the last glacial advance. Although suburbanization is rapidly devouring New Jersey's agricultural land, substantial estates and farms still exist in parts of the Piedmont, and truck farms still dominate many parts of the southern Inner Coastal Plain. Elliptic tracks reveal prosperous horse farms in the northern Inner Coastal Plain, and dairying still exists in the Ridge and Valley section. The most striking features of the state are its beaches, the Pine Barrens, the Palisades facing Manhattan, the broad marshes and swampland in the northeast, and the hills of the northwest, including the famous Delaware Water Gap.

Drainage. Lakes and ponds cover about 315 square miles of the state's surface. New Jersey's major river, which it shares with Pennsylvania, is the Delaware. The Hudson River separates the state from New York. Other major rivers are the Passaic and the Hackensack, both in the northeast, and the Raritan, which runs west to east and is generally regarded as the boundary between North and Central Jersey. Lake Hopatcong in Sussex and Morris counties is the state's largest.

Climate. The northwest experiences relatively cold winters, with average January temperatures of less than 28° F (−2° C). Relatively mild conditions prevail in the south, with average winter temperatures above freezing (0° C). Summers are relatively hot throughout the state, with averages for July ranging from about 70° F (21° C) in the northwest to over 76° F (24° C) in the southwest. Moist conditions prevail, with seasonally well-distributed precipitation averaging from 44 inches to more than 48 inches (1,120 to 1,220 millimetres).

Plant and animal life. Virtually all of the plant life that is common to the northeastern United States can be found in New Jersey, and in the marshes and Pine Barrens of southern New Jersey many rare plant species grow, including some insect-ingesting plants. The Barrens are dominated, however, by oak and pine on the well-drained sites and by white cedar in the poorly drained bogs. Common trees elsewhere include oaks, sugar maple, hemlock, birch, ash, sweet gum, and other deciduous species. Common plants are wild azalea, rhododendron, honeysuckle, mountain laurel, wintergreen, and cardinal flower.

The Hackensack Meadows, west of the Palisades, and the Great Swamp of Morris county are relics of glacial lakes of the last ice age. The former is dominated by grasses, the latter by trees. The Hackensack Meadows are managed to encourage wise land use and pollution abatement. The Great Swamp, one of several poorly drained areas in the Passaic River basin, is a National Wildlife Refuge. Elsewhere, increasing suburban development has encroached on wildlife habitats, although bears and wildcats can still be found in some woodlands. Deer are common, even in many suburbs, as are opossums and raccoons. Other mammals, snakes, and birds common to the Northeast (including migratory species) are also to be found.

Settlement patterns. The most distinctive of New Jersey's regions is its long shore, which stretches for 125 miles (200 kilometres). Much of it is composed of long and narrow barrier islands separated from the mainland by shallow lagoons and from one another by tidal inlets. Cape May, at the southern tip of the state, was the first U.S. summer resort, and both that community and Long Branch in Monmouth county were known as the playgrounds of presidents during the 19th century. The quality of the Shore, as it is called, ranges from the urban garishness of Asbury Park to the opulence of Deal and Mantoloking. In such resorts as Wildwood and Atlantic City, the nightlife plies its revels until dawn, whereas such other towns as Avalon, Ocean City, and Beach Haven are family resorts. The Jersey Shore at its best can be found in its two state parks, Sandy Hook in the north and Island Beach in the south. The dunes there are still topped with coarse but fragile grass, and the osprey still build their nests. The marshes teem with wildlife, and the trees are bent and twisted by wind and salt spray.

Five northeastern counties in the New York City metropolitan area—Essex, Hudson, Passaic, Bergen, and Union—contain about two-fifths of New Jersey's population. Four of the six largest cities in the state—Newark, Jersey City, Paterson, and Elizabeth—are located there. The Newark–Hudson county–Elizabeth complex appears to many travelers as one endless industrial city: dingy, smelly, but throbbing with commercial life.

Beyond the cities lie the suburbs. Most are pleasant and prosperous, but some are old and show signs of urban blight. Industrial construction in suburban communities has increased, but many suburban towns, especially in Bergen county, remain bedroom communities of New

The Shore

The Boardwalk in Atlantic City, N.J.

York City and of the New Jersey cities. Newark's population doubles every day as the work force pours in. New Jersey remains dominated, however, by the two giant cities just beyond its borders. Hundreds of thousands of Jerseyans cross the Hudson to New York City on the average weekday. North Jerseyans watch New York television, root for New York athletic teams, and patronize New York theatres and restaurants. The same situation exists in Camden, Burlington, Gloucester, and Mercer counties, where residents cross the Delaware to jobs in Philadelphia.

South Jersey South of Trenton begins South Jersey, comprising most of eight counties. It includes roughly one-half of the state's area but only about one-fourth of the population. The loamy soil of the Inner Coastal Plain is well suited to vegetable farming, and most of the land not covered by forest or marsh is farmed. Less than 1 percent of the state's population is engaged in farming, but farm income per acre is among the highest in the nation. The Pinelands National Reserve, covering about 1,700 square miles (4,400 square kilometres) in the Outer Coastal Plain, was established in 1978; it was the country's first national reserve, in which the federal government provides funds for the purchase of a core of undeveloped land while state and local authorities are responsible for resource evaluation and economic planning in surrounding developed areas.

Central Jersey, all of five counties and part of three, is largely a plain, but hilly areas occur in Hunterdon and Somerset counties. Middlesex and Mercer counties, especially the former, are industrialized. Princeton University is located in Mercer county and the borough of Princeton, which combines the charm of the campus with a rich colonial past to create one of the nation's loveliest towns. Rutgers, the state university, is in nearby New Brunswick. Hunterdon and Somerset counties are a mixture of suburban development, farmland, and woodland.

The four counties of northwestern New Jersey take in a mixture of small town, affluent suburb, and rugged countryside, although two major cities, Passaic and Paterson, are located in Passaic county. The area contains numerous dairy farms and parks and recreation areas.

Hackensack Meadows Although relatively small, the Hackensack Meadows are immensely valuable because of their location in the centre of the world's busiest metropolitan area. By the late 1960s, New Jersey had put together the machinery to develop this area through the Hackensack Meadowlands Development Commission. In 1976 the Meadowlands Sports Complex began operations with the opening of a racetrack. In 1977 the Giants (football) Stadium was completed, and the Brendan Byrne Arena opened in 1981. Warehouses and corporate buildings have also been constructed in the area.

The people. New Jersey's population reflects the immigration patterns of the 19th and 20th centuries, including Germans and Slavs, Russian and European Jews, Irish and Italians. It was a prime destination for the waves of blacks that left the South during and after World War II. The state has a sizable Puerto Rican population, and many Cubans who left their country after Castro's revolution settled in North Jersey, mainly Hudson county.

Italian-Americans are the state's largest ethnic group. They are the predominant white bloc in the cities, although the cities also contain sizable Polish, Hungarian, and other eastern European groups. Italian-Americans and blacks dominate the political and cultural life of the cities—a situation that often has brought the two groups into competition and conflict.

The most striking demographic trend in New Jersey is the movement of the white population away from the cities and the concurrent proportional growth of the urban black population, accompanied by an emigration of industry and commerce. Old, outmoded factories are left behind for sleek new buildings outside cities, and huge suburban shopping centres have replaced the downtown department stores. This shift means more jobs in the suburbs, and the jobs create a commensurate demand for housing. The cities bordering these areas have become increasingly black, a situation that is potentially explosive because of the continuing decay of the cities and the poor quality of housing and services the cities can supply.

The economy. Alexander Hamilton's attempt in 1791

to build the nation's first industrial town at Paterson was a failure. He had the right idea, however, for New Jersey was destined to become an industrial giant.

The State Division of Economic Development, along with the major utilities and business organizations, conducts an effective program of selling New Jersey to industry. The state has attracted many industries, especially corporate headquarters from New York City, largely through its greater space, better transportation, and favourable tax rates. The spread of industry and housing, however, has cost New Jersey much of its farmland, the most valuable per acre in the nation.

Research. New Jersey has a large and prestigious research industry. The state has one of the highest numbers of engineers and scientists per capita in the nation. The great inventor Thomas Edison established a research laboratory in Menlo Park in 1876. There he created the electric light and the phonograph and pioneered the technology of the motion-picture industry. Edison's primitive laboratory has been succeeded by the David Sarnoff Research Center, the Bell Telephone and Western Electric laboratories, the Institute for Advanced Study at Princeton, the James Forrestal Research Center, and many other modern centres dotting the landscape of Central Jersey. **Leadership in scientific research**

Industry. New Jersey's major industry is chemicals. The next largest is the manufacture of electrical and electronic equipment. New Jersey also ranks high in the production of clothing, food, toys, sporting goods, and stone, glass, and clay products. The state is not noted for its mineral deposits, but North Jersey provided much of the iron for the shot and cannon used during the American Revolution. New Jersey's mineral products now largely consist of clays, sand, and gravel.

The resort industry is a big factor in New Jersey's economy, especially in the south, where a bad year at the Shore hurts the economic well-being of the entire region. In 1976, residents of New Jersey approved a constitutional amendment to permit gambling casinos at Atlantic City, which, with its huge Convention Hall and fine hotels, does a thriving winter convention business. Casinos are taxed, and tax moneys go to senior citizens and the disabled.

Transportation. Since colonial days, when New Jersey's toll roads linking Philadelphia and New York City were a major industry, transportation has been the lifeblood of New Jersey's economy, and its role in New Jersey can best be appreciated in the Newark area. There, 12 lanes of the New Jersey Turnpike converge with the main line of the Penn Central Railroad, Newark Airport, Port Newark, and Port Elizabeth to provide a steady stream of goods and people. The economy of northern New Jersey is bound tightly to that of New York City, and the commercial traffic between the two states is the nation's heaviest.

In 1921 the states of New York and New Jersey formed the Port of New York Authority, now called the Port Authority of New York and New Jersey—a bistate commission empowered to finance and operate transportation facilities in the New York metropolitan area. The Port Authority, as it is known, is a public corporation operating Newark and Teterboro airports in New Jersey and La Guardia and Kennedy airports in New York, as well as the Lincoln and Holland tunnels, three bridges, huge piers, bus and rail lines, and truck terminals. **Port Authority of New York and New Jersey**

A similar but much smaller transit complex exists in the Camden area, linking the South Jersey area with Philadelphia. There is a deepwater port at Camden on the Delaware and high-speed transit to Philadelphia. The turnpike runs 132 miles (212 kilometres), the length of the state from the George Washington Bridge in the north to the Delaware Memorial Bridge in the south; the Garden State Parkway stretches 152 miles (245 kilometres) north to south; and the Atlantic City Expressway runs 44 miles (71 kilometres) to connect Atlantic City with the Camden area. Even before World War II, New Jersey had one of the finest road networks in the nation.

Administration and social conditions. *Government.* New Jersey has had three constitutions. The current constitution dates from 1947 and has been amended more than 30 times. New Jersey governors serve terms of four years, and they are permitted reelection to a second term. Be-

cause no other state official runs on a statewide basis, the governor has no rivals in the executive branch. The governor appoints, with the advice and consent of the Senate, virtually all top state officers and members of state boards, authorities, and the judiciary, and he has the authority to supersede county prosecutors. By virtue of his broad executive and administrative powers, the vast patronage at his disposal, and his unequalled access to the press, radio, and television, the governor of New Jersey is as strong a chief executive as there is in the nation. A two-thirds majority of both legislative houses is necessary to override his veto. The governor can be checked and occasionally defeated by a rebellious legislature or by political leaders, but New Jersey governors seldom lose wars, only battles. In 1966, in response to a U.S. Supreme Court decision, the New Jersey legislature adopted the "one man, one vote" principle. Voters in each of the state's 40 districts choose one senator and two general assembly members. Assemblymen are elected every two years, while senators run for one two-year term and two four-year terms each decade.

New Jersey's 21 counties are administered by boards of freeholders elected countywide. The boards vary from three to nine members, depending on the size of the county. In addition to these elected officials, local governments are supplemented by service commissions, boards, and authorities, many of which enjoy wide independence and even autonomy. Attempts to merge municipalities, reduce the number of school districts by consolidation, or strengthen county government have not been successful; local power and prerogatives are important determinants in New Jersey politics.

In national elections New Jersey is a swing state. It tends to lean Republican, but the Democrats frequently control the state legislature. Although there have been signs that civic bossism is declining, New Jersey's political system was long dominated by powerful county leaders who drew their power from the patronage and contracts that they dispensed through control of the municipal courthouse or city hall. The most notorious of these bosses was Frank Hague, who ruled Jersey City and Hudson county from 1917 to 1947. For three decades Hague dominated the Democratic Party and heavily influenced the Republicans. His philosophy of government was best summed up in his famous reply to critics: "I am the law."

Education. Public elementary and secondary schools in New Jersey are largely locally funded and controlled. New Jersey's reputation for shirking its responsibilities to higher education is improving. There was no state university at all until 1946, when New Jersey took over full responsibility for Rutgers University, now the State University of New Jersey composed of three campuses and a wide variety of colleges and programs. The process of converting the state colleges from strictly teacher-preparation institutes to full-fledged liberal arts schools was begun in the 1960s. Princeton University (1746) is one of the nation's most prestigious private institutions.

Health and welfare. Most of the services rendered the citizens of New Jersey come from the state, although most of the major counties maintain institutions of one kind or another and much funding comes through federal agencies. The state has a shortage of hospitals, prisons, and various other institutions, although much has been done to correct the situation.

Cultural life. New Jersey is well served by the cultural amenities of New York City and Philadelphia, and therefore few were developed in the state. New Jersey helped correct its reputation as a cultural backwater with the opening, in 1968 in Monmouth county, of a beautiful amphitheatre at the Garden State Arts Center, home of the New Jersey Symphony Orchestra. The facility has proved to be a success, and its programming of music, drama, and dance has been well received.

There are several summer theatres in New Jersey, most of them located near vacation areas. The McCarter Theater, on the Princeton University campus, is open all year and offers high-quality plays and musical presentations.

New Jersey has more than 100 nationally listed museums, many of them operated in conjunction with historic sites or buildings. The New Jersey State Museum, which includes a planetarium, is located in the state capitol complex in Trenton. The Rutgers University Art Gallery, the Newark Museum, and the Princeton University Art Museum are among other well-known museums.

New Jersey's rich traditions are manifested in such historic homes and sites as the Rockingham State Historic Site, Washington's winter headquarters near Princeton, where he wrote his farewell address to the Continental Army; Morven, the home of Richard Stockton, signer of the Declaration of Independence, in Princeton; the restored colonial villages of Batsto and Allaire; and the Camden home of poet Walt Whitman. These and other historic sites attract thousands of tourists each year. The state also operates a system of parks, forests, recreation areas, natural areas, and marinas.

HISTORY

The colony. Before the Europeans came, the Delaware (or Lenni Lenape) Indians had long occupied the region. In 1524 the Italian explorer Giovanni da Verrazzano, was the first European to reach New Jersey. Almost a century passed before colonization began with the arrival in 1609 of the English navigator Henry Hudson, who sent a party to explore Sandy Hook Bay. The first permanent European settlement was at Bergen (now Jersey City) in 1660. The colony was brought under English rule in 1664, although for the next five years the Dutch disputed that claim. In 1676 the province was divided into East and West Jersey, the former going to Sir George Carteret and the latter to a group of Quakers. The division continued until 1702, when all of the province reverted to the crown.

Unlike other colonists, who suffered from the harshness of English rule, the early Jerseyans were of such an independent nature that it was the royal governors who did much of the suffering. Until 1738 New Jersey and New York were ruled by a single governor. When Lewis Morris took office as the first governor of New Jersey alone, one member of the Assembly advised his colleagues on how governors should be treated: "Let us keep the doges poore and wee'll make them do as we please."

Revolution and statehood. Considerable division occurred within the state over the American Revolution, and Tory activity was heavy. The most significant battle of the conflict was fought in New Jersey on Dec. 26, 1776. General George Washington and his hungry, ragged troops crossed the Delaware River from Pennsylvania in so-called Durham boats (shallow-draft freight vessels), surprised the garrison of German mercenaries in Trenton, and captured the city. A week later, Washington won another vital battle at Princeton, routing the British forces under Colonel Charles Mawhood. The victories breathed new life into the Revolution, and an army of colonials near despair was transformed into an effective fighting force.

Between the Revolutionary and Civil wars, New Jersey underwent tremendous industrial development, largely abetted by the construction of canals and, later, railroads. The railroads, in particular the Camden and Amboy (forerunner of the Penn Central), played a crucial role in the state's political life, dominating and controlling legislators and governors during the "robber baron" era of industrial expansion in the 19th century. Accommodating tax laws of that era gave New Jersey the epithet The Mother of Trusts: one-half of the nation's largest corporations made their headquarters in the state. Public dissatisfaction with the power of the trusts and public utilities helped pave the way for the election of Woodrow Wilson as governor in 1910. Industrial growth continued during and after World Wars I and II, and, until the mid-20th century, the growing decay of the cities was overlooked amid the general prosperity brought by industry. New York

One of the 13 original U.S. states, New York was until the 1960s the nation's leading state in nearly all population, cultural, and economic indexes. Its displacement by California about the middle of the 1960s was caused by the enormous growth rate that has persisted on the West Coast of the United States, rather than by a large decline in New

York. It remains the second most populous state in the nation, and New York's gross economic product exceeds that of all but a handful of nations throughout the world.

New York is situated across a region of contrast—from the Atlantic shores of Long Island and the skyscrapers of Manhattan through the rivers, mountains, and lakes of upstate New York to the plains of the Great Lakes. With canals, railroads, and highways, New York is a principal gateway to the west from the Middle Atlantic and New England states and a hub for travel to and from much of the nation. The cities of the state—from New York City through Albany (the state capital), Utica, and Syracuse to Rochester and Buffalo on the Great Lakes—and their suburbs are home to more than four-fifths of all New Yorkers.

Both the New England and Southern colonies had a great deal more to do with the movement toward revolution and with stabilizing the new nation during its early decades than did New York, but, once it got under way, New York's growth attained a breakneck pace. The state—and New York City in particular—remains the centre of much of the nation's economy and finance, as well as of many formative impulses in American art and culture. The overwhelming presence of New York City has tended to divide the state socially and politically, causing long-standing problems for both the city and state, but the influence and image of the state is a major element in national political life.

Role of New York City

The 49,108 square miles (127,190 square kilometres) of New York are bounded, from west to north, by Lake Erie, the Canadian province of Ontario, Lake Ontario, and Quebec province; on the east by the New England states of Vermont, Massachusetts, and Connecticut; on the southeast by the Atlantic Ocean and New Jersey; and on the south by Pennsylvania.

PHYSICAL AND HUMAN GEOGRAPHY

The land. Although New York state and New York City are synonymous to many people, the state has a wide range of geographic and climatic conditions. During at least a part of the Ice Age, most of New York was covered by glaciers; the only exceptions were southern Long Island, Staten Island, and the far southwestern corner of the state.

Relief. The movement of the glaciers left New York with nine distinct physiographic regions. Each has its own characteristic landforms, with distinctive geologic structures and patterns of erosion. In the northeast the Adirondack upland is characterized by the highest and most rugged mountains in the state, reaching 5,344 feet (1,629 metres) at Mount Marcy and 5,114 feet (1,559 metres) at Algonquin Peak of Mount McIntyre. With the exception of some forestry activities, the region has little economic value other than for recreation. A large part of it has been designated as a wilderness preserve by the state.

The St. Lawrence Lowlands extend northeastward from Lake Ontario to the ocean along the boundary with Canada. Within this area are three subdivisions: the St. Lawrence Marine Plain, a flat to gently rolling strip of land along the St. Lawrence River; the St. Lawrence Hills south of the plain; and, farther south, the Champlain Lake Plain.

The Hudson-Mohawk Lowland follows the Hudson River from New York City to Albany and then turns west along the Mohawk River. The Hudson valley, between the Catskill Mountains on the west and the Taconic Range on the east, is from 10 to 20 miles (15 to 30 kilometres) wide; the Mohawk valley is 10 to 30 miles wide. These routes provided access from New York City and New England into the hinterland of New York. Cutting pathways through the mountains of central and western New York, these rivers became the state's avenues of commerce, serving first as the basis of the Erie Canal and later as the route of the New York Central Railroad and of the New York State (Thomas E. Dewey) Thruway.

To the east of the Hudson River lies the New England Upland, extending eastward into Massachusetts and Connecticut and southward across the lower Hudson valley into Pennsylvania.

Two small regions complete the geographic picture in southeastern New York. The Atlantic Coastal Plain, which extends from Massachusetts to Florida, takes in Long Island and Staten Island. A small finger of the eastern Piedmont region juts up from New Jersey for some distance along the west bank of the Hudson.

The Appalachian Highlands, the largest region in New York, comprises about one-half of the state, extending westward from the Hudson valley to the state's southern and western boundaries. The Catskill Mountains (the peaks of which reach 2,000 to 4,000 feet), the Finger Lakes Hills area, and the Delaware River basin are located in this region. The Catskills, with their mountains and lakes, are primarily a recreation area. The Finger Lakes area also provides many opportunities for summer and winter sports, and its valleys provide excellent grasslands for dairying. The Delaware basin is a mixed-farming area.

The Appalachian Highlands

A plateaulike region known as the Erie-Ontario Lowlands lies to the north of the Appalachian Highlands and west of the Mohawk valley and extends along the southern shores of the Great Lakes. It is composed of lake plains bordering the Great Lakes that extend between five and 30 miles inland from the lakes. Because of the moderating influence of the lakes on the weather, the region has become an important fruit-growing area. Between the lake lowlands and the western reaches of the Adirondacks and north of Oneida Lake lies the Tug Hill Upland, which is one of the least settled parts of the state because of its poor soil and drainage and its excessive winter snow conditions.

Drainage. Among New York's special geographic features are its two major shorelines: 127 miles (204 kilometres) bordering the Atlantic and 371 miles (597 kilometres) on Lakes Erie and Ontario. In addition, the state has some 8,000 lakes and nine major rivers. The Hudson and Mohawk rivers have played the most important roles in the state's history, but the Genesee and Oswego, flowing northward into Lake Ontario, also have been important. The Delaware, Susquehanna, and Allegheny drain the southern and western portions of the state and provide a large part of New York City's water supply. The East River connects Long Island Sound with New York Bay and separates Long Island and Manhattan. The most dramatic of the waterfalls that dot the state is Niagara Falls, a source of much hydroelectric power as well as one of the major scenic attractions of the Northeast.

Soils. New York soils can be grouped into categories based on their parent material. One of the most productive groups is found in regions of lime-rich glacial till. Where drainage is good and the terrain not too steep, these soils

Niagara Falls, with the city of Niagara Falls, N.Y., to the upper left.

are excellent for agriculture. They occur in a broad belt across the state and into the Hudson valley. Another lime-rich soil group is found in areas that were formerly glacial lake beds, such as the Erie-Ontario Lowlands and large parts of the Hudson and St. Lawrence valleys. Soils of this group are fine-textured and are characterized by level to-pography. Where drainage is not a problem, these soils are quite suitable for agriculture. Alluvial soils, formed from the sediments of glacial meltwater and the floodwaters of present-day streams, are found in many valley bottoms, especially in the Appalachian Highlands and along the Mohawk and Hudson rivers. Most of Long Island is also covered by alluvial soils, which often have excellent pro-ductive potential. Other soils less suitable for agriculture are derived from lime-poor glacial till, such as those north of the major limestone outcroppings in the Ontario Low-land, or from material that is too shallow or coarse, such as those in the rugged mountainous areas of the state or in the sandy region west and north of Albany.

Climate. New York's climate was a great disappoint-ment to the early Dutch settlers. Since Manhattan is actually Mediterranean in latitude, these early settlers were rather bewildered to find that "it freezes and snows severely in winter." If Manhattan was uncomfortably cold and wet in the winter months, the rest of the state must have been an even greater disappointment.

Average tempera-tures
Average July temperatures range from 77° F (25° C) in New York City to 64° F (18° C) at Indian Lake in the Adirondacks; averages in January range from 33° F (0.5° C) on Long Island to 14° F (−10° C) at Stillwater Reservoir in the Adirondacks. These figures represent the extremes, but there are substantial differences in climate between New York City and upstate Albany, Buffalo, Rochester, and Syracuse. A tendency to cloudiness across the state results in few completely clear days. New York City has about 100 such days each year, Syracuse and Buffalo 72, Binghamton 68, and Albany 73.

Precipitation ranges from 32 to 45 inches (810 to 1,140 millimetres) a year, with the Catskills receiving the greatest amount, while the Erie-Ontario Lowlands receive the least. The region around Buffalo receives an unusual amount of snow because it is on the eastern shore of Lake Erie.

Plant and animal life. More than half of New York state is forested woodland. Some 150 kinds of trees, including such southern species as the tulip tree (yellow poplar) and sweet gum, are found in the state. Most woodland, however, is dominated by a small number of northern hardwoods, chiefly beech and sugar maple in association with ash, basswood, cherry, birch, red maple, various oaks, and, occasionally, conifers such as white pine and hem-lock. The spruce–fir association found in extensive parts of the Adirondacks and the largely oak-dominated forests in southeastern New York are the major exceptions to the northern hardwood forests.

Small mammals like the deer mouse, eastern cottontail, snowshoe hare, woodchuck, gray squirrel, muskrat, and raccoon are common. Larger mammals include the white-tailed deer, beaver, and black bear. New York is host to numerous migratory birds. Year-round residents include the eastern meadowlark, American goldfinch, cardinal, eastern bluebird, cedar waxwing, bluejay, several kinds of woodpeckers and owls, the red-tailed hawk, ruffed grouse, mallard, and the common house sparrow, introduced to North America from Europe at Brooklyn in 1850.

Diverse influences
Settlement patterns. The cultural and social distinctions among various parts of New York state have diminished. Upstate cities, for example, are nearly as ethnically varied as New York City. Certain cultural and social characteris-tics brought by early settlers remain visible and, to some degree, still influence lifestyles. During the colonial period and for a number of years after the American Revolution, New England was a major source of immigrants, and there are traces of the New England influence, particularly in the architecture and small-town planning of the northern shore of Long Island and in northern Westchester county. The Dutch influence around Albany remains in little more than place-names and street names, plus some preserved or rehabilitated Dutch architecture. German and Scottish settlers have left their mark in the Schoharie valley and

parts of the Hudson and Mohawk valleys (German), in Orange and Ulster counties, and in the Cherry valley area (Scottish).

The distinction between upstate and downstate is nor-mally along political lines—upstate, conservative; down-state, liberal. Political differences are matched by social differences. Downstate is divided between New York City and the suburbs, and, within the city, differences among the boroughs are important. Although Manhattan has many low-income residents, it is the centre for sophisti-cated lifestyles and liberal politics. In the outer boroughs are relatively stable ethnic neighbourhoods and commu-nities in the process of changing their ethnic or racial makeup; they are more conservative than those in Man-hattan but are oriented toward the Democratic Party. The suburbs are dominated by white middle- and high-income families living in detached houses, though the income spread in the suburbs has increased, and the inner suburbs are beginning to resemble the city's outer boroughs.

The rural upstate areas must be distinguished from the upstate cities and their suburbs. Rural New York remains conservative both politically and socially. The city re-gions vary from relatively sophisticated Rochester, with its heavy concentration of white-collar technical and manage-rial employees, to the more conservative Syracuse–central New York area. Buffalo, with its emphasis on heavy in-dustry, has a large blue-collar population.

The people. Since the colonial period much of New York's growth has resulted from immigration, both from other states and from abroad. Before the American Rev-olution the Dutch, English, Scots, and Germans were the primary settlers; they were followed in the first half of the 19th century by New Englanders spreading across devel-oping parts of upstate New York and into Westchester and northern Long Island. The influx of European immi-grants came first from the northern and central parts of the Continent and later from southern countries.

Patterns of im-migration

Many New Yorkers either are foreign-born or have par-ents who were born abroad. The primary nations of origin are Italy, parts of the former Soviet Union (*e.g.*, Russia and Ukraine), Poland, Germany, Ireland, the United King-dom, and Canada, but a significant percentage of people are also from a great diversity of other countries. Related to this is the state's religious composition. About one-third of the population is Roman Catholic, while more than 10 percent is Jewish.

The growth of the nonwhite portion of the population in the 20th century is significant. The first large-scale influx of blacks from the Southern states occurred during World War I, but it was small compared to the migration that occurred during and after World War II. In 1940 only 4.4 percent of the population was nonwhite, but by the late 20th century the proportion had increased to about 20 percent, concentrated in the state's metropolitan areas and, within those areas, in the central cities.

Puerto Ricans are another immigrant group that has had a significant impact on the economy and culture of New York since World War II. Several hundred thousand re-side in the state, mostly in New York City. After a heavy immigration of Puerto Ricans during the 1950s and early '60s, the growing economic strength of Puerto Rico led to a considerable reduction, with those entering the state being largely offset by those returning to Puerto Rico.

Much internal migration in the 20th century, far from being random, represents a sorting out of the population, with higher- and middle-income whites moving to the suburbs, leaving low-income whites and blacks within the central cities. Many economic divisions, notably manu-facturing and the headquarters of corporations, also have moved to the suburbs. This movement of people and economic activity has resulted in the urban crisis that is familiar across the United States: there is an increasing need for the cities to combat crime and other symptoms of poverty, while their social and economic resources to do so are removed. Although the economic strength of the large metropolitan areas of New York is growing, the cities proper are increasingly unable to participate in the prosperity and seem likely to slip still further behind.

The economy. New York's economy is similar to those

of the other Northeastern states. The services sector predominates, though manufacturing is also important. Although the economies of other states are growing more rapidly, New York still has great economic strength. The state has, for example, a complex network of nearly every form of transportation. Its resources of electrical power for domestic and commercial use are enormous, including conventional coal- and oil-burning plants, hydroelectricity from the Niagara region, and a large nuclear capability.

New York is represented in nearly every economic category designated by the federal government. In comparison with the rest of the United States, however, New York's economy has a disproportionately large share of wholesale and retail trade, finance–insurance–real estate, transportation–communications–public utilities, manufacturing, construction, and government. It is, on the other hand, underrepresented in farming and mining.

The state plays both regulatory and promotional roles in the economy. The Public Service Commission controls the rates charged by public utilities, and the Division of Housing and Community Renewal encourages the production of housing and other community facilities. The Department of Commerce aids in attracting new economic activity to the state, providing information and assistance to industries seeking to locate there, giving financial support to local communities interested in developing industrial parks, and offering other incentives to encourage the location of more industries within such areas.

New York tends to have somewhat lower unemployment rates during downturns in the national economy than does the rest of the nation, but it also recovers less rapidly. This is largely a result of the state's economic mix and its heavy dependence on nonmanufacturing activities.

New York has one of the most highly unionized work forces of any state. Unionization has grown rapidly in the service sector among such government employees as teachers, sanitation workers, police, and fire fighters. The nature of labour–management relations varies considerably from industry to industry, with workers in construction and the garment and apparel industries wielding great power. Nearly every session of the state legislature devotes attention to the field of labour relations, particularly public-sector employee relations.

Services and manufacturing.   New York has a declining proportion of its population engaged in manufacturing. In 1947 more than one-third of its employed population was in manufacturing, while by the late 20th century the figure had shrunk to about one-fifth.

There is some economic specialization within different parts of the state. Services and finance–insurance–real estate activities are more concentrated in the New York City metropolitan area than in upstate New York. Buffalo is strong in heavy industry, while Rochester dominates the manufacture of photographic and optical equipment and is primarily responsible for the state's strong position in instrument production.

Syracuse ranks high in the state in the production of primary metals, machinery, and paper and allied products, as well as in educational employment. The Utica–Rome area specializes in machinery and primary metals, while the Albany–Troy–Schenectady area is strong in the production of paper and allied products. Albany, as the state capital, leads in government employment. The smallest of the state's metropolitan areas, Binghamton, is the original site of the International Business Machine Corporation (IBM) and therefore has a concentration of employment in the computer and business-machine field.

Agriculture.   Dairying is the most important source of farm income, providing more than one-half of the total. Other important sources of farm income are poultry and eggs, livestock products, fruit, vegetables, and field crops. The state raises a variety of horticultural specialties, including nursery products, crops grown under glass, flower bulbs, and seeds, and it competes with Vermont in the production of maple sugar. The fruit and vegetable farms supply the food-processing industry with such products as apples, cherries, peaches, currants, strawberries, tomatoes, peas, beans, sweet corn, and cabbage.

Transportation.   A great part of New York's economic advantage is its location on important natural transportation routes and facilities that connect urban centres within and without the state.

The Erie Canal, opened in 1825, tied New York City and its port to Buffalo and the westward-expanding nation. The main railroad system followed the route of the canal, with feeder lines that jutted north and south into the remainder of the state. After World War II the limited-access Thomas E. Dewey Thruway stretched from New York to the Pennsylvania state line, passing through Albany, Utica, Syracuse, Rochester, and Buffalo. The basic paths of these main transportation routes are not substantially different from those that were used by the state's original settlers.

With the completion in 1918 of the New York State Barge Canal System, which incorporated the old Erie Canal, New York had the country's most extensive inland waterway system. Although this system is an important means for moving bulk goods—particularly petroleum products, a major share of the tonnage—the annual tonnage carried on the system has dropped considerably.

The railways first challenged the supremacy of the canal as a carrier of goods. Beginning in the mid-19th century with the establishment of the New York Central Railroad, a system was built that tied New York's major cities to Chicago, Boston, Montreal, and other urban centres. Although the number of passengers carried has declined, the railroads remain important handlers of freight. Much of this freight originates at the port of New York, the largest port in the United States, which handles about one-tenth of all the nation's imports. Nearly one-third of all immigrants to the United States pass through this port.

Central to the highway system are the limited-access highways. The Thruway connects at Albany to the Northway, which extends northward to Canada. In central New York a major highway runs from the Pennsylvania state line to Canada, passing through Binghamton, Syracuse, and Watertown. At Syracuse this route intersects with the Thruway, causing the city to remain a transportation hub and accounting in large part for its economic viability. Another limited-access expressway extends across the southern tier of the state. On Long Island a set of east–west highways ties the island to New York City, New England, and upstate New York.

The New York metropolitan area, with its combination of subways, buses, and railroads, has the most complex commuter system in the nation. The New York transit system, nearly 800 miles (1,280 kilometres) long, provides intracity passenger transport. Commuter railroads serve suburban Long Island, New Jersey, Connecticut, and Westchester county. Many of these transportation networks were brought under the control of a single agency, the Metropolitan Transportation Authority, in 1968.

The three largest airports in the New York City metropolitan area are John F. Kennedy International, La Guardia, and Newark (New Jersey).

Administration and social conditions.   *Government.* New York's constitution prescribes the distribution of powers among the branches of state government as well as the system of local government throughout the state. However, the document is excessively detailed and includes provisions that most constitutional scholars consider more appropriately treated in legislative statutes than in a constitution. Because of the detail, articles tend to become quickly outdated, necessitating frequent conventions for revision. Since the first convention in 1777, others have been held at roughly 20- to 25-year intervals. The constitution requires that the question of holding a convention be placed before the voters of the state every 20 years.

The first constitution established a bicameral legislature and provided for the first popularly elected governor in the United States, but it restricted the suffrage to male property holders. Veto power was vested in a Council of Revision, comprising the governor, the chancellor of the Supreme Court, and the justices of the Supreme Court, while the appointment of nearly all state and local officials lay with the Council of Appointment, comprising the governor and four senators. These councils represented an effort to avoid the autocratic rule that New Yorkers had experienced at the hands of the colonial governors. The

Marginal notes:

The state's role in the economy

Waterways and railways

Highways

The constitutional framework

convention of 1821 abolished the two councils, extended the franchise, and introduced a formal bill of rights.

The convention of 1846, influenced heavily by the populist spirit of Jacksonian democracy, imposed financial limitations on the legislature, which often had extended state credit to private ventures in such areas as railroad and canal building. Many state offices, including the judiciary, were made elective.

The constitution of 1894 has been amended more than 200 times. Its provisions include a merit civil-service system, limitations on disposal of the state's forest preserve, a commitment to public education, and the first constitutional definition of state–local relations.

The state government is led by a strong governor, with power over appointments and budget. The governor is restricted, however, by a number of independently appointed or elected officials. The Board of Regents, for example, which presides over education, is appointed by the legislature. An independently elected comptroller acts as auditor for both state and local governments.

The legislature comprises a Senate of 61 members and an Assembly of 150. Members of both houses are elected for two-year terms. Each house has standing committees concerned with issues of public policy. Several committees composed of both senators and assembly members study policy issues and make recommendations to the legislature. The state also uses numerous nonlegislative commissions—appointed by the governor, by the legislature, or by both—to investigate such problems as education-aid formulas, state–local relations, the judicial process, welfare administration, and governmental organization.

New York is divided into 12 judicial districts. Each district has several elected judges, and together they form the Supreme Court. Four judicial departments act as appeal divisions from the supreme and inferior courts. The highest court is the Court of Appeals. The governor appoints the judges to the appellate departments from those elected to the Supreme Court, and the seven justices serving on the Court of Appeals are appointed by the governor with the approval of the Senate for 14-year terms. The Court of Claims hears cases against the state. There is a variety of local courts, including county courts, family and surrogate courts, and the court system of New York City.

Much legislative debate revolves around the allocation of state aid to local jurisdictions. The constitution has contained a home-rule provision since 1896, but court interpretations of the provision, which gives the state the power to act in any matter in which there is a state concern, have tended to weaken the home-rule concept and continue Albany's domination of local governments. Moreover, the increasing interdependence of the state and its parts caused by urbanization and industrialization inevitably has reduced the autonomy of local jurisdictions.

Local government

The state has 62 counties, which are divided into towns. Urban areas may be incorporated as either cities or villages. Cities are not subject to a town's jurisdiction, but villages remain a part of the town in which they are located and residents pay town as well as village taxes. New York City comprises five counties.

Unlike those states in which either town or county government is weak, New York has strong local governments of both types. This situation often leads to overlapping in the provision of governmental services outside of the cities. Special districts include port and bridge, health, and fire districts, as well as regional market authorities. The Port Authority of New York and New Jersey is one of the largest special districts, operating bridges, harbours, and related facilities throughout the New York City metropolitan area, including those in northern New Jersey.

The decision of the U.S. Supreme Court in 1965 requiring legislative districts to be roughly equal in population brought new life into New York's county government, since town supervisors were no longer able to have dual responsibility as county supervisors. Many counties, including urban counties outside New York City, have opted for single-executive systems.

Cities and villages generally are governed by a mayor and a council; only a few cities, the largest of these being Rochester, use the city manager plan. Some of the larger cities have a second legislative body, often called the Board of Estimate. In New York City the mayor, the president of the city council, the comptroller, and the five borough presidents serve on this body. In other cities, membership usually includes the mayor, the president of the city council, and one or more high-ranking fiscal officers.

The state–local governing system of New York places heavy responsibilities on local governments, and more than one-half of the state budget consists of aid to local government. Most of the aid is for public schools; other allocations include welfare, health, highways, and housing and urban renewal.

Systems of taxation

To finance such services, New York's relatively healthy economic base provides the source of one of the highest taxation per capita systems in the United States. State impositions include income, sales, business, and excise taxes. Federal funds are a major source of revenue. Local revenues are derived mainly from property and sales taxes. The broad state base plus the widespread use of local sales taxes allows New York to rely less on local property taxes than do other large or heavily populated states.

Political life.   New York state politics has generally been defined by strong Democratic Party control in New York City and dominance by the Republican Party upstate and on Long Island. Since 1920, both Democratic and Republican governors have held power in New York. During these decades the legislature has tended to be Republican, although since 1975 the Assembly has tended to be Democratic-controlled and the Senate Republican-dominated.

Although the Democrats and Republicans have strong statewide party organizations, New York is one of the few states in which third and fourth parties have thrived and often played important roles in elections.

Education.   New York spends more money per pupil for public education than any other state except Alaska. This public school system, with compulsory schooling between the ages of six and 16 (17 in Buffalo and New York City), had its beginnings in the colonial period. Schools were established by churches with government support as early as 1638 in New Amsterdam. It was not until 1791, however, that the state's first public school was established. Some state support was granted in 1795 to elementary schools, and in 1812 a permanent system of public schools was established. Parent-paid fees provided a part of the support until all elementary schools became free in 1867. During the 1850s a few cities established public secondary schools, and during the second half of the 19th century they spread across the state.

The University of the State of New York, one of the most comprehensive educational organizations in the world, was established in 1784 and its governance placed under a Board of Regents. From 1812 to 1904 the educational system in New York was administered by two departments. In 1904, however, the state legislature placed all educational activities under the direction of the Board of Regents. The board selects the state commissioner of education, approves the establishment of new colleges, licenses entry into professions, approves new degree programs, and advises the legislature on all educational issues. Standardized exams used in all secondary schools are called regents' exams. Scores on these exams provide a measure for determining school performance and form the basis for the awarding of a wide range of scholarships.

The Board of Regents

In 1948, public institutions of higher education, primarily teachers colleges and two-year agricultural and technical institutions, plus newly established institutions, were incorporated into the State University of New York, an institution distinct from the University of the State of New York but a part of that larger entity. Before then, private institutions had dominated higher education. Although private institutions in New York enroll a higher proportion of college students than in many states, the state system has been since its founding the fastest growing public institution of higher education in the nation.

The state university system comprises four general types of institution. Major university centres are located at Stony Brook, Albany, Binghamton, and Buffalo. The teachers colleges and several campuses have become general colleges concentrating on undergraduate education but pro-

viding some graduate training. Two-year state institutions and community colleges are supported in about equal parts by the state, the local community, and student fees. The City University of New York, supported by the state and by New York City, provides a great variety of programs ranging from those offered by two-year community colleges to graduate education.

Private colleges and universities
There are more than 200 private institutions of higher education ranging in size from a few hundred students to more than 30,000 at New York University. This group includes some of the best-known universities in the nation. Columbia University, founded in 1754 as King's College, is known for the high quality of its graduate instruction and for the national influence of its teachers college. Cornell University, the base for the agriculture, human ecology, veterinary medicine, and industrial- and labour-relations units of the State University, is a member of the Ivy League, along with Columbia. Fordham and St. John's are perhaps the best-known of the state's many Roman Catholic colleges and universities. The University of Rochester, known for its programs in music and the natural sciences, and Syracuse University, home of the Maxwell School of Citizenship and Public Affairs, the first university unit established for training students for public service, are also well-known private institutions. Other well-regarded institutions include Colgate, Hamilton, Union, St. Lawrence, Bard, Skidmore, Barnard, and Vassar.

Health and welfare. The life expectancy of New York state residents is shorter than the national average, but the state has some of the finest hospital and medical education facilities in the United States. The great majority of New Yorkers are covered by hospital and surgical insurance. Social welfare is a major enterprise in New York state. State benefits range from aid to families with dependent children to the support of nursing homes. Many state residents also participate in the federal food stamp program.

Cultural life. Much of the style and tone of life in the United States is set in New York City, which remains the artistic, cultural, and economic capital of the nation. The fashion industry is headquartered in its garment district. The heart of the nation's live theatre is found on and off Broadway; many television programs originate in New York City, where several broadcast and cable networks have their home offices, and many motion pictures are filmed on its streets. The city's museums—particularly the Metropolitan Museum of Art, the Museum of Modern Art, and the American Museum of Natural History—set a standard for similar institutions across the country.

Several major publishing houses have their headquarters in New York City, as do a large number of national magazines. The central offices of many of the country's largest corporations are located there, supporting a great many banks, public-relations firms, advertising agencies, management consultants, and law firms. Because of this concentration of business and culture, New York City maintains a leading national position in American life.

Regional museums and institutions
Cultural activities are not confined to New York City, however. Many art museums are located in the state's large and small cities. The Albright-Knox Art Gallery, in Buffalo, has collections of contemporary paintings and sculptures. In Rochester are the Memorial Art Gallery of the University of Rochester, the Rochester Museum and Science Center, the Strong Museum, and the International Museum of Photography at the George Eastman House. The Everson Museum of Art of Syracuse and Onondaga County is considered an outstanding example of modern architecture, while the city's Erie Canal Museum is devoted to the history of the canal. The New York State Museum in Albany is the oldest and largest state museum in the United States. Symphony orchestras outside New York City include those of Buffalo and Rochester, while the Eastman School of Music at Rochester is internationally known. Fine architecture is found across the state, and the performing arts are pursued by professional and amateur groups. The cultural life of the state's many college and university towns often is centred on these institutions.

The Saratoga Performing Arts Center in Saratoga Springs is the summer home of the Philadelphia Orchestra and the New York City Ballet. Theatrical performances also are held at this modern cultural centre. The Chautauqua Institution, founded in 1874 on Chautauqua Lake in southwestern New York, inspired the national "chautauqua movement" of public lectures and adult education during the late 19th and eary 20th centuries; the institution now offers a wide range of cultural and educational activities, including concerts, opera, drama, and lectures.

Cooperstown, founded by the father of the novelist James Fenimore Cooper, is known as the village of museums, the best known of which is the National Baseball Hall of Fame and Museum. At the Angel Moroni Monument on the Hill Cumorah near Palmyra, an annual pageant depicts the founding of the Mormon church. South of Palmyra are the Greyton H. Taylor Wine Museum in Hammondsport and the Corning Glass Center in Corning. Historic homes, forts, and battlefields are found throughout the state; more than one-third of all the battles of the U.S. War of Independence, including the Battle of Saratoga, were fought in New York.

New York was the first state in the Union to establish a program for continuing financial support of the arts. The Council of the Arts, which administers the program, funds organizations in the fields of the performing arts, visual arts, film and media, and special programs.

The variety of New York's geography provides not only great beauty but also opportunities for recreation, relaxation, and a study of the past. With the cool summers of the Adirondacks, the snowy slopes of the Catskills, the ocean beaches and lakes, and a variety of water sports, New York state has a broad recreational base.

Recreation

HISTORY

Two major groups of Indian tribes were living in the New York region when Europeans first arrived: the Mahican (Mohican) and Munsee tribes of the Algonquian family near the Atlantic coast, and farther inland, the five tribes of the Iroquois—Mohawk, Oneida, Onondaga, Cayuga, and Seneca—which formed the Iroquois Confederacy about 1570. This confederacy of Indian tribes, with its advanced social and governmental institutions, reached the height of its power about 1700. The alignment of these tribes with the British against the French and the Algonquian probably enabled the British to emerge as victors in the nearly 150 years of struggle between the two European powers in northern North America.

Settlement and colonial period. New York was originally settled as a colony of the Netherlands following Henry Hudson's exploration in 1609 of the river later named for him. In 1624 the Dutch established Fort Orange at modern Albany as the first permanent European settlement in New York. One year later New Amsterdam was established at the foot of Manhattan Island. To legalize the settlement, Peter Minuit, the Dutch governor, paid the Indians merchandise worth about 60 Dutch guilders—about $24. Although the Dutch established several settlements along the Hudson, their interest was more in trade than in permanent agricultural development. Thus, while the trading posts prospered and aided the general expansion of the empire of the Netherlands, no deep roots of permanent colonization were planted in New York. The most likely explanation for this lies in the economic prosperity and social stability of the homeland. The Dutch citizens had no strong economic motivations to move overseas, nor were there sufficient religious quarrels at this time to promote any such movement. When an English fleet sailed into New York harbour in 1664, Peter Stuyvesant, the governor, surrendered without a fight. Although controversy ensued for several years, the colony was firmly in English hands by 1669. Under the English it was renamed New York, for the Duke of York.

Despite this change in ownership and sovereignty, however, the colony developed slowly. Like the Dutch, the English crown granted large tracts of land to private individuals. This system of landownership was not very attractive to settlers such as the farmer-colonists who had settled the New England area, and agricultural development, particularly in the areas along the Hudson valley, remained slight.

Slow rate of growth in the colonial period

The European war between France and England had its counterpart in North America. The French, established along the St. Lawrence and in Quebec, made a number of forays into northern and central New York. The strong Five Nations federation of the Iroquois aligned itself with the English in New York and New England because of aid given earlier by the French to the rival Algonquian. This warfare discouraged settlement beyond Albany. The military situation was brought to a conclusion in 1763 by the Treaty of Paris, which confirmed English dominance of the New York region. A gradual but steady movement of settlers from New England was the beginning of New York's population explosion. The New Englanders moved across the borders of Connecticut and Massachusetts, some remaining on the east bank of the Hudson, others passing through Albany to the interior.

In 1698 the colony's population was about 18,000, two-thirds of it concentrated in and around New York City. By the eve of the American Revolution, it had grown to 163,000, with the concentration nearly exactly reversed, but New York still ranked only seventh among the American colonies. Dutch culture remained strong in New York City and in Albany, while most of the settlements in the interior had a flavour and dialect of the New England Yankee; there were also several German communities. This emerging pattern of cultural heterogeneity was later to have a considerable influence on the politics of the state, as were the waves of immigration from Europe that followed the war and continued well into the 20th century.

Revolution, statehood, and growth. New York contains many of the battlegrounds of the American Revolution. The war in New York took on many of the characteristics of a civil war, since the area probably had a higher proportion of residents who were loyal to the crown than did any other colony.

Following the war a part of New York's leadership aligned itself with leaders from other colonies to urge establishment of a strong central government for the new nation rather than the loose confederation that was then in power. New York delegates participated vigorously in the Constitutional Convention, one of the leaders of which was Alexander Hamilton. Despite the role played by Hamilton and by other New York delegates in drafting the Constitution, the politics of ratification within the legislature were intense and bitter, and New York was the 11th state to endorse the U.S. Constitution.

The American Revolution and the War of 1812 temporarily interrupted New York's expansion to the west, but thereafter the movement began in earnest. Turnpikes spread westward from Albany and from other locations up and down the Hudson River, and settlers moved across the state. The opening of the Erie Canal in 1825 confirmed New York's position as the gateway to the west from the Atlantic Coast. The railroads followed in quick order and tended to follow the pattern of trade that had been established earlier by the turnpikes and the canal.

According to the census of 1800, New York state had become the second largest in the Union, trailing only Virginia; 10 years later it had surpassed all other states. Its leadership was not only in population, size, and growth but also in the areas of manufacturing, trade, and transportation—and in the increasing heterogeneity of its population.

Growth and change also were reflected in the political and governmental history of the state. The original state constitution restricted suffrage to property holders and established a governing system that was dominated by large property holders and leading commercial interests. The change in population composition, as well as shifting political attitudes in the nation, soon caused New York to move in a more democratic direction. During the 1830s a vigorous campaign was launched against the system of landownership in the Hudson valley, with renters eventually being given the opportunity to own the land they tilled. The constitutional convention of 1846 confirmed these democratic moves by expanding suffrage and restricting the power of both legislature and governor.

Emergence of political divisions. New York continued to grow in virtually every dimension, but its political development became centred on the increasing chasm of

Improvements in transportation

interest and affection between New York City and upstate New York. The issue of home rule, the demands of the city for total powers of self-government, has remained central to the conflict.

During the 1780s an organization, eventually to be known as Tammany Hall, was formed in the city to combat attempts by propertied Revolutionary leaders to limit the franchise. Largely middle-class in membership, it did not extend its democratic principles to the lower classes or to the immigrants. By the mid-19th century, however, through workers' and equal-rights parties, Irish politicians came to dominate the Tammany organization and the office of mayor; the trend culminated in the control of the Democratic machine after 1868 by William "Boss" Tweed.

Well into the 20th century, the name Tammany was an international byword for municipal corruption at the highest levels. City-state antagonism was fueled by Democratic domination in the city and Republican domination of the areas upstate and, in most years, of the statehouse and the legislature as well. Investigations of Tammany Hall and city politics in general were highlighted by those of the Seabury Commission (1931–32), which brought about the resignation of Mayor James J. Walker and led to the reform administration of Mayor Fiorello H. La Guardia (1933–45) and the efforts of subsequent mayors to tread the line between the power of Tammany Hall in municipal elections and an image of political incorruptibility.

City-state conflicts

Much of Tammany Hall's power was based on its social services to the waves of immigrants that had inundated New York City until changes in immigration laws slowed the tide during the 1920s. When the state and federal governments began to take over such services as social security, workmen's compensation, unemployment, welfare, and health benefits, notably during the depression of the 1930s, Tammany's hold began slowly to erode.

Recent trends. Since World War II, New York's social and educational services have increased dramatically, while its industrial base has eroded. This has created a difficult financial situation for both the state and New York City, with the latter barely avoiding bankruptcy in 1975. While responsibility remains with the state to provide a growing number of services, a succession of governors and legislative leaders have been successful in gradually reducing taxes and broadening the state's economic base.

(A.K.Ca./P.J.Sc.)

Pennsylvania

One of the original 13 American colonies, the Commonwealth of Pennsylvania has long been one of the most populous states in the nation. Geographically, it is the Keystone State, integrating first the older states of the Northeast and the South and later the states of the East and the developing territories and states of the Midwest. The state is polarized by two great metropolitan areas: Philadelphia lies athwart the vast population belt stretching along the seaboard from Maine to Virginia, and Pittsburgh is the beginning of the booming industrial belt reaching westward across the Great Lakes plains to Chicago and Milwaukee. The state capital, Harrisburg, nestles in the foothills of the Appalachian Mountains.

The Keystone State

The 45,308 square miles (117,348 square kilometres) of Pennsylvania are bounded on the north by Lake Erie and New York; on the east by New York and New Jersey; on the south by Delaware, Maryland, and West Virginia; and on the west by the panhandle of West Virginia and by Ohio. Although it is classified as a Middle Atlantic state, it does not touch the Atlantic Ocean at any point. Water, nonetheless, has been nearly as crucial in the state's growth as has the wealth of its earth. The boundary with New Jersey is formed by the Delaware River, on which Philadelphia is the major element in the Pennsylvania–New Jersey–Delaware harbour complex that is one of the world's busiest shipping centres. In the northwest a small panhandle separates Ohio and New York and forms a 40-mile (64-kilometre) waterfront on Lake Erie, giving the state access to the iron-ore barges and other commerce of the Great Lakes. Located at the point where the Allegheny and Monongahela rivers meet to form the Ohio

River, Pittsburgh has become one of the nation's busiest inland river ports.

PHYSICAL AND HUMAN GEOGRAPHY

Surface
features

The land. *Relief.* The mountains and rivers that dominate Pennsylvania's natural landscape have had a major influence in determining its use. The Allegheny section of the Appalachian Mountain system, running across the state from southwest to northeast, leaves only a triangle of Piedmont and Coastal Plain in the southeast, with Philadelphia and environs at its extreme point. The Allegheny Front and Mountains form a diagonal spine across the centre of the state, while to the north and west a rugged plateau region falls almost at the lakefront into the Lake Erie lowlands, known as the Lake Erie Plain.

In the eastern part of the state, the Delaware is fed mainly by the Lehigh and Schuylkill. The Susquehanna, draining the largest section of the state, is a wide, shallow stream that meanders finally into Maryland and Chesapeake Bay. The Ohio River is formed by the confluence of the Allegheny and Monongahela rivers at Pittsburgh, from where it flows westward to the Mississippi. Minor systems lead into Lake Erie in the northwest and the Potomac from the southwest.

Pennsylvania takes in parts of seven physiographic regions. Inland from the fertile Coastal Plain around Philadelphia, the Piedmont is an area of rich limestone soils and farms that are the mainstay of the state's agriculture. The Reading Prong, part of the New England Upland, is a small tongue of a ridge in the northeast. In the south central region, the northernmost finger of the Blue Ridge extends into the state; its topography was important in the Battle of Gettysburg during the American Civil War.

The Appalachian Ridge and Valley region, running southwestward across the state, to the west of the Piedmont, comprises a series of parallel ridges and valleys, including the long and wide Lehigh, Lebanon, and Cumberland valleys, which were important in America's early westward movement. From this rises the Appalachian Plateau, whose rough-and-tumble aspect of small valleys and broken, ragged ridge lines covers more than one-half of the state, from the southwestern and western borders to the Delaware in the northeast and on into New York. Plateaus up to 2,000 feet high cover northern Pennsylvania. Mount Davis, at 3,213 feet (979 metres), is the state's highest point; its landscape is dotted with coal mines and mining towns. The sandstone soils of the mountains and plateaus are poor agriculturally. In the northwestern bump lie the Lake Erie lowlands, a flat area of gravelly but fertile soils that once lay at lake or ocean bottom and now is a producer of grapes, wine, and potatoes.

Climate. Pennsylvania has a continental climate that is characterized by wide fluctuations in seasonal temperatures, with prevailing winds from the west. The frost-free period lasts the longest in the southeast, the Ohio valley, and the Erie lowlands. Higher areas are free of frost from three to five months a year. Coupled with some 39 inches (991 millimetres) of rain annually, this provides adequately for the cultivation of temperate-zone crops and vegetation. In the north, average temperatures range from about 25° F (−4° C) in January to about 69° F (21° C) in July. In the southeast and western portions of the state, averages are several degrees higher.

Plant and animal life. Pennsylvania marks the transition zone between the northern and southern forests of North America. About one-half of the state remains wooded, although only small areas are virgin forest. Hickory, locust, maple, cherry, beech, black walnut, elm, chestnut, poplar, ash, sycamore, willow, linden, white and yellow pine, and other conifers are all common in various parts of the state. The southeast has some trees common to the Mississippi valley.

Pennsylvania's abundant wildlife makes it a leading state for hunting. Unprotected predatory species include red and gray foxes, wildcats, and weasels. Most large animals gradually have been eliminated by humans. Species once common—*e.g.,* the black bear and the Canada lynx—are now rare, although skunks and raccoons, pheasants and

other game birds, and, in some areas, deer are still found in abundance. More than 150 species of fish, including trout, salmon, and walleye, are found in the streams.

Settlement patterns. The Pennsylvania landscape under human settlement is as varied as its physical geography. Although nearly all the land is forested or under cultivation, Pennsylvania is considered an urban, industrial state. Urban areas in the state, however, comprise widely separated enclaves.

The rural areas of Pennsylvania, especially the farmlands, lie mostly in the southeastern counties. In the southwest and in the Susquehanna River valley, pasturelands dot the landscape. Generally, several small villages, each consisting of a general store, a church, a gasoline station, and a few houses, are located within a short distance of a larger town that serves the surrounding farms. In the mining regions the town structure was once completely dependent on the mines, but company ownership of stores and miners' homes is no longer prevalent.

Rural
and urban
Pennsyl-
vania

For the most part, the urban centres of Pennsylvania developed along with specific industries. Reading is known as a textile and hosiery town, Hershey as a chocolate town, Pittsburgh and Bethlehem as steel producers, Erie as a Great Lakes port, the Wilkes-Barre and Scranton areas as centres of the coal industry, and Philadelphia as a centre of finance, industry, and commerce. In turn, the city influences the surrounding area as a supplier of goods and as the determiner of artistic and cultural life.

The people. Four major Indian groups with tribal settlements occupied Pennsylvania at the time of the European incursion. These included the Delaware, or Lenni Lenape, in the Delaware River basin; the Susquehanna along the Susquehanna River in Pennsylvania and Maryland; the Shawnee along the Susquehanna and near the present site of Easton; and various segments of the Iroquois League. The Indians were a powerful force in the early history of Pennsylvania, but all were gradually pushed to the north or west as European settlers prospered. Only about 11,000 Indians remain today in scattered locations.

Although the Swedes and the Dutch arrived in Pennsylvania first, the English Quakers were by far the most important of the early groups that settled along the Delaware River. With a secure hold on the region, the Quakers quickly turned the Delaware counties—especially William Penn's three original counties of Philadelphia, Chester, and Bucks—into a thriving commercial region.

Penn's policies of religious toleration and his experiments in democratic forms of government encouraged other groups to settle in Pennsylvania in large blocs. Germans from the Rhineland settled in the inland counties of Lancaster, Lehigh, Berks, and Northampton. By the time of the American Revolution, the Pennsylvania Dutch, as they had become known, constituted one-third of the colony's population. They turned their land into one of the richest and most productive farming areas in the world and made their customs, cooking, and artwork famous.

Beginnings
of ethnic
diversi-
fication

Small subgroups of the German community are important components of Pennsylvania's population. Largely religious, they include the Amish, Mennonites, Moravians, Schwenkfelders, and Dunkers. The Amish have attracted special attention because of their old-fashioned dress and educational methods and their preference for living apart and farming without modern machinery.

The third major ethnic group to settle in Pennsylvania were the Scotch-Irish. Pressing west past the areas of English and German settlement, this group settled along the western frontier during the middle of the 18th century. Along with the true Scots the Scotch-Irish composed about one-fourth of the entire population of the colony at the outbreak of the Revolution. In addition to the three main groups listed above, there were small numbers of French Protestants, or Huguenots; Welsh; Cornish; Irish; and, of course, the Dutch and the Swedes. Through the early years of the 20th century, immigration to Pennsylvania continued to be largely German and Irish.

Until the 1860s, there was open land on the western frontier of the state. During this period the religious character of the commonwealth changed: the Quakers and the Pennsylvania Dutch lost numerical strength to predomi-

nantly Roman Catholic immigrants, and Presbyterianism and Methodism gained footholds in the west. During the 20th century the most important European immigrants to enter the state have been of southern and eastern European origin, particularly Italians and Slavic peoples, who provided manpower for the state's burgeoning industry and manufacturing. During and after World War II, in response to the needs of the economy, black Americans from the rural South began to settle in Pennsylvania in increasing numbers. For the most part, the newly arrived black Americans, like the earlier Italians and Slavs, have tended to settle in urban, industrial areas.

Although Pennsylvania is a melting pot of many ethnic groups, the Quakers and the Pennsylvania Dutch continue to play roles in the culture and tradition of the state out of proportion to their actual numbers.

The greatest population density is found in Philadelphia, Delaware, and Allegheny counties, the latter including Pittsburgh. In 1790, when the first federal census was taken, 89.8 percent of the population was classified as rural. In 1900 the urban population, at 54.7 percent, outstripped the rural for the first time.

The **economy.** With fertile farmland, large areas of commercial forest land, seemingly inexhaustible supplies of coal, many navigable waterways, and an economically strategic location on the Eastern Seaboard, Pennsylvania has historically been one of the most prosperous states in the nation. As the exploitation of its primary wealth— soils, minerals, and forests—proceeded during the 18th and 19th centuries, Pennsylvania held a place that was second only to New York in wealth and population.

Although its steel industry began to contract in the mid-1960s, Pennsylvania still produces more specialty steel than any other state, and its manufacturing industries are as diversified as those of any state in the Union. In the 20th century, however, the changing nature of modern industry, the use of fuels other than coal, and the growth of the rest of the country have had an adverse effect on the Keystone State both in production and in population, and there are pockets of poverty and unemployment.

In 1956 the Pennsylvania Industrial Development Authority was set up to assist in the redevelopment of areas plagued by chronic unemployment. In 1987, the Pennsylvania Economic Development Partnership was created to direct the development of the state economy through both public and private channels.

Mining. The coal industry of Pennsylvania has declined steadily since World War II, but it remains important nationally. Pennsylvania's reserves of anthracite coal are the largest in the nation. The state produces only a tiny amount of the nation's crude oil, but natural gas deposits are a major asset. Pennsylvania is among the nation's highest-volume producers of power from nuclear energy, despite an accident at the Three Mile Island nuclear power plant, near Harrisburg, in 1979. Small deposits of iron ore have been discovered, along with limestone, silver and gold, copper, cobalt, zinc, and salt.

Industry. Pennsylvania's first ironworks, for the production of wrought iron, was built in Berks county in 1716. The eastern region long was the centre of production, especially after large-scale exploitation of its anthracite fields began. The Pittsburgh area became increasingly important as bituminous coal and coke replaced anthracite and as the Great Lakes became the route for barges from the rich iron ore beds around Lake Superior. Western Pennsylvania, however, is at a geographic disadvantage when compared to the Great Lakes–Midwest steel region, and its older plants are less efficient than those of the Southern United States and some foreign countries.

Pennsylvania has always been known for the variety of its manufactures. It is a leader in the cement industry and produces many clay products. In terms of value added by manufacture, the once dominant iron and steel industry has been surpassed by food products, chemicals (primarily pharmaceuticals), machinery, and electrical and electronic equipment. Industry is unevenly distributed, its greatest concentration being in Philadelphia, Allegheny, and Montgomery counties.

The retail sales industry is also important. John Wana-

maker opened the nation's first department store in Philadelphia in the 1870s. Frank Woolworth opened his first successful five-and-ten in Lancaster in the same period. Other famous Pennsylvania retailers include S.H. Kress, S.S. Kresge, G.C. Murphy, J.J. Newberry, and W.T. Grant, all of whom founded chains bearing their names.

Agriculture. Pennsylvania has the largest rural population in the United States, and nearly one-third of the state is under cultivation. The Pennsylvania Department of Agriculture, various vocational agricultural programs, and farm and commodity organizations offer assistance to the state's farmers. Livestock, including dairy and beef cattle, hogs, and sheep, and livestock products are the major components of farm income. Pennsylvania is a major producer of milk, eggs, and poultry; fruits, including peaches, grapes, cherries, and apples; hay; corn (maize); mushrooms; and Christmas trees. Ice cream and sausage are major processed food products.

Transportation. Pennsylvania's three major ports— Philadelphia, Pittsburgh, and Erie—are supplemented by others along the Delaware, the Susquehanna, the Allegheny, the Monongahela, and the Ohio. Petroleum is Philadelphia's leading cargo, but it has facilities for handling ores, coal, molasses, and general cargo as well. Part of Erie's facilities have been converted to the building of ore carriers for Great Lakes service.

Pennsylvania's highway system, one of the most extensive in the nation, includes the Pennsylvania Turnpike, a four-lane toll road joining New Jersey and Ohio that was a model for the nation in modern superhighway construction. It is paralleled to the north by Interstate 80, known in Pennsylvania as the Keystone Shortway.

Although the bankruptcy of the Penn Central Railroad in 1970 reduced passenger and freight service, the rail lines continue to serve as important economic links for the Middle Atlantic region. Philadelphia and Pittsburgh have the state's largest airports, but others also have international status.

Administration and social conditions. *Government.* Under the constitution of 1968 and subsequent amendments, the executive branch comprises the governor and lieutenant governor, the attorney general, the auditor general, the state treasurer, and the members of the cabinet. The secretary of state and the secretary of education are appointed by the governor, subject to Senate approval.

The governor is elected for a four-year term and may be reelected for one additional term. Among the main powers of the governor are the right to return bills for reconsideration and to veto portions of appropriation bills. The General Assembly is made up of a Senate of 50 members and a House of Representatives of 203 members. Senators are elected for four-year terms and representatives for two-year terms.

A unified judicial system comprises the Supreme Court, Superior Court, Commonwealth Court, and a modern system of lower courts. The seven justices of the Supreme Court are elected for 10-year terms; justices of the peace and of the municipal and traffic courts of Philadelphia are elected for six-year terms.

Under the constitution, local government is provided for by the General Assembly, which classifies cities, counties, boroughs, school districts, townships, and special authorities by population. All Assembly provisions must be uniform throughout each class, and no legislation may be directed toward one locality. As the only first-class city, however, Philadelphia becomes the target of legislation aimed at this class. Along with Pittsburgh and Scranton, which are second-class cities, it has a strong-mayor government. Smaller cities have several governmental forms, while boroughs have elected councils and weak mayors.

Pennsylvania has two classes of townships and five classes of school districts. Local authorities are special units that were set up in 1933 to circumvent constitutional restrictions preventing local units from incurring debt. The cities, boroughs, and townships, as governmental units, carry out the usual public services. A constitutional amendment in 1968 allowed local governments to opt for home rule.

Between the Civil War and the 1920s, state government was, with a few breaks, in the hands of a succession

Functions of the executive

of Republican administrations that made the statehouse a seat of "boss rule." A similar dynasty persisted in Philadelphia until the late 1940s. Since the mid-20th century the membership of the General Assembly has usually been about evenly divided between Republicans and Democrats. Pennsylvania generally exhibits the characteristic American pattern of rural conservatism and urban liberalism, although locally such labels may bear no necessary relation to particular parties.

Education. Public school districts provide physical facilities, teachers, and textbooks and levy taxes and issue bonds. The state Department of Education oversees statewide standards for teacher certification and curricula and apportions money to local school districts.

Institutions of higher learning

Pennsylvania is the home of more than 100 colleges and universities in addition to a state system of two-year community colleges. Pennsylvania State University, in University Park, is the publicly supported land-grant institution; it has 21 branch campuses throughout the state. The University of Pennsylvania, in Philadelphia, was originally a charity school at its founding in 1740 but was transformed by Benjamin Franklin and others into an academy. In 1765 it opened the first medical school in North America. Today, among its most notable divisions are the Wharton School of Finance and Commerce and the University Museum, a leading sponsor of archaeological expeditions and research throughout the world. Though privately endowed, it receives considerable state aid.

State aid is given also to Temple University (1884), in Philadelphia, whose programs are geared to its urban setting, and to the University of Pittsburgh (1787). Philadelphia is a major centre of medical education, while in Pittsburgh the Carnegie Mellon University, formed in 1967 by the merger of the Carnegie Institute of Technology (founded in 1900 as the Carnegie Technical School) and the Mellon Institute (1913), makes that city a centre of scientific studies. Other schools with major reputations are Bryn Mawr College (1880); Haverford College (1833); Swarthmore College (1864), a Quaker school; and Villanova University (1842), a Roman Catholic institution—all near Philadelphia. Dating from the 18th century are Dickinson College (1773), in Carlisle; Franklin and Marshall College (1787), in Lancaster; and Washington and Jefferson College (1787), in Washington. Carlisle was the site of the Carlisle Indian Industrial School from 1879 to 1918 and is now the home of the U.S. Army War College.

Health and welfare. More than one-half of Pennsylvania's budget is allotted to education, welfare, and highways. Hospitals and centres throughout the state deal with problems of chronic illness, old age, mental retardation, and the like, and local governments are assisted in welfare payments in a broad range of categories. Urban renewal programs also receive state and federal funding. Pennsylvania created a Department of Aging in 1979, and a new Department of Corrections was established in 1984.

Cultural life. In colonial times, Philadelphia was the focus of the nation's intellectual, cultural, and political life. As Pennsylvania grew and prospered, Pittsburgh and other, smaller cities also became centres of the arts.

Two of the nation's major symphony orchestras are located in Pennsylvania. The Philadelphia Orchestra, under such conductors as Leopold Stokowski and Eugene Ormandy, has become world famous, as has the Pittsburgh Symphony Orchestra, under such conductors as Victor Herbert, Fritz Reiner, and William Steinberg. Philadelphia's Academy of Music provides a home and concert hall for its orchestra, and the world famous Curtis Institute of Music, founded in 1924, is one of the world's leading conservatories. In addition, many community orchestras perform throughout the state. Also notable is the religious music of the Moravians. At their cultural centre, Bethlehem, the Bach Choir's Bach Festival attracts music lovers every May from many states.

The visual arts: painting and sculpture

Philadelphia is the home of one of the world's finest art museums, the Philadelphia Museum of Art, and of the Rodin Museum. The Pennsylvania Academy of the Fine Arts offers a base for teaching and study as well as for display. The Carnegie Institute's museum and library in Pittsburgh also houses many famous paintings. Among famous artists whose homes were in Pennsylvania are Charles Willson Peale and his two sons Raphaelle and Rembrandt, Benjamin West, Mary Cassatt, Thomas Eakins, and the Wyeths, N.C. and his son Andrew. The Calder family of Philadelphia is famous in sculpture. Alexander Milne Calder's giant statue of William Penn stands atop City Hall, and his grandson, Alexander Calder, gained renown for his free-form mobile sculptures.

Philadelphia long vied with New York City as the theatrical capital of the young nation, though today it is basically a tryout town for shows on their way to Broadway. Summer theatres have proliferated across the state, especially in the many resort areas. Temple and Carnegie Mellon universities offer major programs in theatre. The Pennsylvania Ballet gives performances within the state and also maintains an active touring schedule. Among well-known writers of the 20th century with Pennsylvania origins are Pearl S. Buck, Rachel Carson, James Michener, Christopher Morley, John O'Hara, Mary Roberts Rinehart, and John Updike.

In addition to its art museums, Pennsylvania enjoys many other museums. The Franklin Institute in Philadelphia is a museum of applied science. The William Penn Memorial Museum and Archives Building in Harrisburg, the Pennsylvania Farm Museum of Landis Valley near Lancaster, the Annie S. Kemerer Museum in Bethlehem, and the Mercer Museum of the Bucks County Historical Society (crafts and craftsmen's tools) in Doylestown house fine collections. There are also small museums in Allentown, Reading, Scranton, and Greensburg and historical society museums in Lancaster, York, Reading, Wilkes-Barre, and West Chester, to mention a few. The Pennsylvania Historical Commission, established in 1913 and known since 1945 as the Pennsylvania Historical and Museum Commission, is active in conservation of the state's historical heritage; the Philadelphia Historical Commission oversees that city's many historic shrines.

Pennsylvania has retained strong elements of folk culture among its diverse ethnic groups. The Plain People—the Amish, the Mennonites, and other small sects—have kept their old customs and dress and often resist the use of machinery. In Lancaster county, where the Amish still farm with horses and oxen, their wagons are a familiar sight. The folk art and the cooking of the Pennsylvania Dutch are famous, and their brightly painted hex signs adorn their large barns. At Czestochowa, in Bucks county, the

J Irwin—H Armstrong Roberts
Amish horse and buggy in Lancaster county, Pa.

largest Polish church in America is evidence of the area's Polish population.

Public figures such as Benjamin Franklin were responsible for the emergence of newspapers, magazines, and libraries in the colony. Later, the Lippincott and the Curtis publishing families became giants in the publishing world, the Lippincotts as book publishers and the Curtis family as publishers, until recently, of such magazines as *The Saturday Evening Post, Ladies Home Journal,* and *Country Gentleman. The Farm Journal,* a Philadelphia publication, is one of the nation's leading farm magazines. Several other major publishers are also headquartered there.

All of Pennsylvania's cities and larger towns have newspapers, and many ethnic newspapers are published throughout the state. The major cities have their own television stations, and most local communities have their own radio stations. Station KDKA, the first commercial broadcasting station in the world, opened in Pittsburgh in 1920.

Historic eminence in publishing

HISTORY

Swedes were the first European settlers in the area that was to become Pennsylvania. Traveling up the Delaware from a point at the present site of Wilmington, Del., Governor Johan Printz of the colony of New Sweden established his capital on Tinicum Island in 1643, within the boundaries of modern Pennsylvania. Other Europeans, principally the Dutch, established trading posts within Pennsylvania as early as 1647, although the Swedes remained at Tinicum until 1655. In that year, rivalry and fighting between the Dutch and the Swedes led Peter Stuyvesant, governor of New Netherland, to seize New Sweden. Dutch control of the region ended in 1664, when the English seized all of New Netherland in the name of the Duke of York.

The Quaker colony. In March 1681 King Charles II of England signed a charter giving the region to William Penn in payment of a debt owed by the king to Penn's father, Admiral Sir William Penn. The charter, which was officially proclaimed on April 2, 1681, named the territory for Admiral Penn and included also the term *sylvania* ("woodlands"), as the younger Penn requested.

William Penn intended that the colony should provide a haven of religious tolerance for his fellow Quakers. While still in England, he drew up the first of his "frames of government" and sent his cousin, William Markham, to establish claim to the land and also to establish the boundaries of what became the city of Philadelphia. Penn arrived in 1682 and called a General Assembly to discuss the first Frame of Government and to adopt the Great Law, which guaranteed freedom of conscience in the colony. Under Penn's influence, fair treatment was accorded the Indians, who responded with friendship in return. When Penn returned to England in 1684, the new Quaker province had a firmly established government based on religious tolerance and government by popular will.

Site of battles and Revolutionary ferment

Colonial growth. The century that followed was a period of great expansion and turmoil for Pennsylvania. Its interior included land that was claimed by the French, and, as time went on, the Indians became increasingly hostile to the expansion of settlements to the west and north. Much of the fighting during the French and Indian War (1754–63) took place in Pennsylvania. There the young George Washington began his journey into the

Ohio valley to warn the French to leave; later, it was in Pennsylvania that the English general Edward Braddock suffered defeat at the hands of the French forces and their Indian allies.

For many Pennsylvanians, the period following these conflicts marked growing dissatisfaction with British rule. Limitations on westward expansion, especially as established by proclamation in 1763, were imposed to pacify the Indians, but Pennsylvanians pressed westward over the Alleghenies. Outposts such as Fort Pitt (Fort-Duquesne under the French; now Pittsburgh) became settlements vital to the flow of trade from the opening lands to the west.

By the eve of the American Revolution, Pennsylvania had become a centre of military, economic, and political activity. The first (1774) and second (1775–76) Continental Congresses met in Philadelphia, the Declaration of Independence was signed there, and after the war the city became the capital of the short-lived Confederation and of the fledgling U.S. government.

Early years as a state. In 1790 a new state constitution was adopted that replaced the unicameral legislature of the Revolutionary period with a bicameral one and a fairly strong governor. During the next 70 years, farm equipment was mechanized, roads were improved and extended, canals were built, and railroads spanned the state, all combining with the economic strength of the thrifty Philadelphians to make Pennsylvania a major commercial power. Beginning in 1820, important mining companies were formed to exploit Pennsylvania's deposits of hard and soft coal, and in 1859 Edwin L. Drake drilled the nation's first successful oil well at Titusville. During this same period the state became a leading producer of textiles, ships, lumber, tobacco, and, most important, iron and steel.

The Pennsylvania Emancipation Act of 1781 had pledged the gradual abolition of slavery in the state. Once the Civil War broke out, Pennsylvania became once again a centre of military and political activity. The southern boundary of Pennsylvania, ratified in 1769, was the Mason and Dixon Line. It became the dividing line between the slave and the free states during the Civil War. At Gettysburg the Union army won one of the most decisive victories of the war, against a Confederate force led by General Robert E. Lee.

The Civil War and its effects

Emergence of the modern state. With the end of the Civil War came a period of great economic, industrial, and population expansion in Pennsylvania. Until well into the 20th century, Pennsylvania was the second most populous state in the nation. In 1873 the state passed its fourth constitution; with amendments, the document survived until 1968, when it was so fundamentally reshaped that it became known as the constitution of 1968. In 1898 construction of a state capitol building (replacing a structure that had burned the previous year) was begun at Harrisburg, the capital since 1812. The new building was completed in 1908.

In both world wars, Pennsylvania's heavy industries were major suppliers of iron and steel, arms, and machinery. After World War II, however, the many changes taking place in the global economy began to affect Pennsylvania's emphasis on heavy industry. A relative decline in the state's manufacturing occurred between 1965 and 1984, and Pennsylvania has come increasingly to rely on a variety of high-technology and service industries. (C.L.T.)

THE SOUTH

Alabama

Admitted as the 22nd state in 1819, Alabama comprises 51,705 square miles (133,915 square kilometres) forming a roughly rectangular shape, elongated in a north–south direction. Tennessee is the bordering state to the north, Georgia to the east, and Mississippi to the west. The Florida panhandle blocks Alabama's access to the Gulf of Mexico except in the state's southwestern corner, where Mobile Bay is located. Montgomery is the state capital.

The state offers much topographical diversity. The rich

agricultural valley of the Tennessee River occupies the extreme northern part of the state. In northeastern Alabama the broken terrain of the southern fringe of the Appalachian Highlands begins and continues in a southwesterly progression across the northern half of the state. Below that the band of prairie lowland known as the Black Belt has rich soils that once cradled a rural, cotton-producing way of life central to the state's development. Further south stretch piney woods and then coastal plains until one reaches the striking ranks of azaleas blossoming in the Gulf breezes and the moss-draped live oaks of Mobile.

The Black Belt

The landscape of Alabama has been the scene of many of the major crises in the settlement of the continent and in the development of the modern nation. It was a battleground for European powers vying for the lands of the New World, for the fights between the white settlers and the Indians, for the struggles between North and South during the Civil War, and for the forces of economic and social change that have extensively altered many aspects of the Deep South in the years since World War II. Although Alabama continues to trail near the bottom of the states in many significant social rankings, there has been improvement in race relations, particularly in school desegregation and in the election of blacks to political offices. The state's economy has also shown marked improvement. Yet Alabamians and outsiders alike tend to agree that the state's troubled heritage is often still apparent.

PHYSICAL AND HUMAN GEOGRAPHY

Major relief regions

The land. *Relief.* Although the average elevation of Alabama is about 500 feet (150 metres) above sea level, this represents a gradation from 2,407 feet (734 metres) atop Cheaha Mountain in the northeast down across the Black Belt to the flat, low, southern Gulf Coast counties. Within this gradation, several relief regions may be distinguished.

The southern extremities of the Appalachians cover almost half the state. In the far north the Cumberland Plateau region, segmented by river action, thrusts south across the state line. Altitudes rise to 1,800 feet in the more rugged eastern portions. The Great Appalachian Valley forms another marked division to the east. A small triangular portion of the Piedmont Plateau juts across from Georgia at an altitude averaging 1,000 feet.

The character of the state changes markedly as the rugged, forest-clad hills and ridges of the Appalachian extremities give way to the lower country of the Coastal Plain. The plain has a number of subdivisions: in the north lie the rolling Fall Line Hills, while farther south the pine and hardwood belts add irregularity to the flat landscapes. Arcing into the heart of the lowlands of Alabama, the Black Belt has been distinctive from its association with the cotton production that long dominated its rich soils. The 53 miles (85 kilometres) of coastline have occasional swamps and bayous, backed by timber growth on sandy soils and fronted by stretches of white-sand beaches.

Drainage. The Cumberland Plateau region drains to the northwest through the Tennessee River and the often deep valleys of its tributaries, with much water retained in three large, scenic lakes formed in the 1930s by the Tennessee Valley Authority. The rest of the state is drained southward through broader, lazier valleys. The Coosa and the Tallapoosa rivers join north of Montgomery to form the Alabama, which unites with the Tombigbee, draining the state's western portion. Their waters then part again and are discharged into Mobile Bay through the Mobile and Tensaw rivers.

Soils. There are four main soil zones found in Alabama. In the far north, the Tennessee valley contains the dark loams and red clays that add vivid dashes of colour to the landscape when exposed. Farther south lie the varied soils of a mineral belt, and these are succeeded by the rich limestone and marl soils of the Black Belt. Along the coast of Alabama there are sandy loams and deep porous sands.

Climate. The Alabama climate is temperate, with an average annual temperature of about 64° F (18° C), mellowed by altitude to some 60° F (16° C) in the northern counties and reaching 67° F (19° C) in the southern counties, although summer heat is often alleviated somewhat by the winds blowing in from the Gulf. Occasionally the temperature may rise to 100° F (38° C) in the summer, whereas snow may occasionally fall in the northern counties and frosts are periodic. The average summer temperature is 79° F (26° C); the winter average is 48° F (9° C).

Rainfall is fairly evenly distributed throughout the year, with an annual average of 56 inches (1,420 millimetres) and a concentration on the coast. Droughts are infrequent. These favourable conditions have given the state a long growing season, ranging from 200 days in the north to 300 days in the south.

Plant and animal life. The warm climate of Alabama has nurtured a rich plant cover, including more than 125 tree varieties. Most of the thick forests are in the north and northeast. Pine trees predominate, and live oaks are also found statewide, lending grace to the streets of the older towns and cities. Sweet gum and black walnut are also common, while the colourful red cedar is most abundant in the Tennessee valley and the Black Belt, with the stately black cypress clustering around rivers and ponds. There are many varieties of shrubs and grasses, and bamboo, large canes, and mistletoe are widespread. Muscadines, scuppernongs, and blackberries also flourish. Beardlike Spanish moss gives coastal woodlands a distinctive charm.

Birdlife, too, is rich. Bluebirds, cardinals, blue jays, mockingbirds, doves, woodpeckers, owls, hawks, yellowhammers, and an occasional eagle are found here. Other wildlife includes rabbits, squirrels, opossums, foxes, wildcats, raccoons, muskrats, deer, and even a few bears. Coyotes and armadillos have spread into Alabama from the west. Snakes include poisonous rattlers, water moccasins, copperheads, and corals as well as some nonpoisonous types, such as black snakes. Alligators still exist in some of the swamps and bayous of the coastal regions.

Settlement patterns. By 1980 less than two-fifths of the population of Alabama was classified as rural, and the proportion was declining still further as rural residents sought homes in the state's cities. Eight counties had a population loss during the 1970s. Much of the loss was from the old cotton region of the Black Belt, which had been largely depopulated by the 1980s. By the 1970s, however, the state had ceased to be a net loser of population to Northern migration. A large part of Alabama's rural population lived near, and worked in, metropolitan areas.

By 1960, for the first time, more than half of Alabama's population was concentrated in 10 counties, and the dominance of the urban areas has since continued. The sprawling city of Birmingham continues as the major metropolitan area of the state, with its increasingly service-oriented economy employing about one-fourth of the state's workers and producing one-fourth of all its manufactures. Birmingham's population growth has taken place in outlying suburbs, however.

Urban growth

Mobile, the state's port city, is the second largest metropolitan area, the growth of which, after a surge in the 1970s, slowed in the 1980s, partly as a result of a recession in the oil industry. Cities such as Gadsden and Florence, with manufacturing-based economies, experienced stagnation in the 1980s, while Huntsville grew rapidly as a result of national defense installations and new high-technology industries. Montgomery's population expanded, owing partly to the growth of state government.

The people. Three-fourths of the state's population is white. The white population is significant for its deep roots in the state: the number of foreign-born residents is very small, and most whites are descendants of 19th-century settlers who came from adjoining regions to the east and north. Black Alabamians have equally deep roots in the state, dating to the days of chattel slavery and the African slave trade. Other ethnic minorities make up only a very small percentage of Alabama's population. Religious affiliations in the state are predominantly Protestant, with the various church groups in the black community having played an unusually prominent social role since the days when other outlets for such activity were denied.

Black roots in the state

The birth rate in Alabama, especially in the areas of rural poverty, was somewhat above the national average for many years, but with the depopulation of rural areas and the expansion of the urban economy, the ratio has come nearer to the national average. Some rural areas of the state continue to be plagued with very high rates of infant mortality, attributable to inadequate health care.

The economy. Among the 50 states, the relative status of Alabama may be indicated by its income per capita: it has ranked close to the bottom of the economic scale for a number of years. This low status results, in part, from the depressed state of agriculture, which employs a large segment of the population. Rural poverty thus drags down the state average, concealing more promising developments and the much stronger economic base that exists in the

urban areas. An important development in the Alabama economy has been the emergence of Birmingham as a financial and commercial centre, especially as the home of major state banks, regional utilities, national insurance companies, and international construction concerns.

Alabama spends a high percentage of its total revenue on education, health and hospitals, welfare, and highways. The state has generally low taxes on property and relatively high taxes on consumption. Federal funds support programs affecting agriculture, public education, a wide range of health and welfare projects, conservation, urban development and public works, and highway construction. The federal government maintains the Air University in Montgomery and the George C. Marshall Space Flight Center and the Redstone Arsenal at Huntsville, as well as several veterans' hospitals and a part of the Tennessee Valley Authority operations.

Agriculture. The Alabamian rural economy challenges the traditional view of a dependency on cotton. Although cotton still remains of local importance, it suffered a heavy blow with the onset of the boll weevil blight in 1915, and acreage continued to decline. Mechanization and consolidation increased the average farm size after the 1930s. The diversification of agricultural production then brought a great increase in the acreage devoted to forestry, and cotton fields were given over to pasture for dairy and beef cattle. Poultry has become a major farm product in the state. The principal crops are cotton lint, peanuts (groundnuts), soybeans, and corn (maize). Farm income continues to rise, and the average value of a farm has multiplied many times since the end of World War II.

Industry. Industrial development in Alabama has long been based on the iron and steel industry of Birmingham, the development of which was facilitated by accessible deposits of iron ore, coal, and limestone. Other minerals include the state's well-known white marble. Oil production in commercial quantities dates from 1944, and there are a number of wells in the coastal regions. World War II defense industries gave an impetus to the industrial economy of the state. Although iron and steel production continues to be important to Alabama's economy, the growing chemicals and plastics industries have reduced the reliance on primary metals. Since 1960 the Marshall Space Flight Center at Huntsville, notable for producing the Saturn booster rockets, has been a major contributor to the state's economy. In the 1970s Huntsville experienced the growth of high-technology industries, including computer design and production. At the same time, Birmingham had changed to a predominantly service economy, in which the city's major employer was the University of Alabama and its regional medical centre.

Transportation. Together, the six major rivers of Alabama provide about 1,300 miles of navigable waterways, while Mobile Bay has been deepened by a ship channel. Mobile developed as a modernized port and ranks among the top dozen seaports of the nation. The Tennessee–Tombigbee Waterway, a 234-mile canal opened in 1985, connected two of the state's main river systems. Although railroad transportation, as elsewhere in the United States, has suffered a relative decline in Alabama, bus, truck, and airline traffic have increased in the state.

Administration and social conditions. *Government.* Alabama is governed by a bicameral legislature and a governor and cabinet. The legislature consists of 35 senators and 105 representatives who meet annually in regular sessions and are elected for four-year terms. The constitution, a complex and, some have claimed, outdated and often inadequate document, dates from 1901. After various poll tax and other tax provisions aimed at restricting black voter registration were declared illegal by the U.S. Supreme Court, voter registration among blacks made great progress. The chief administrative officers of the state, ranging from the governor to the state Board of Education, are all elected for four-year terms. The state Supreme Court of nine elected members is the highest judicial body.

At the county level the chief elected officials in Alabama are the county commissioners, judges of probate, tax assessors and collectors, and boards of education. In the

Tugboat pushing barges on the Tennessee–Tombigbee Waterway, western Alabama.
© Ed Malles/Photo Options

municipalities there is no uniform system of government: the mayor–council form is most common, but some cities have a commission, and some employ a city manager.

The Democratic Party of Alabama has long held political control of the state government, although there are signs of an increased Republican showing. In 1986 the state elected its first Republican governor since Reconstruction, and a few Republicans, usually from suburban areas, won places in the state legislature and in local government bodies during the 1980s. Numerous black political organizations have helped increase black participation in the political process. Black office holding was commonplace beginning in the 1970s; several towns and cites have elected black mayors, including Birmingham in 1979.

Education. Elementary and secondary education in Alabama have improved substantially since the 1960s, though public schools in the state suffer from very weak local funding resulting from the state's low taxation on property. Teachers' salaries have risen since the early 1970s. Rural schools get less support than urban ones. Most public schools are integrated racially, though a substantial minority of white children attend private academies.

Alabama has 15 state-supported four-year colleges, many junior colleges and trade schools, and more than a dozen private colleges and universities. The University of Alabama system comprises the state's original college at Tuscaloosa and newer campuses in Huntsville and Birmingham, the latter being home to a nationally renowned medical centre. Auburn University, one of two land-grant institutions in Alabama, has the largest enrollment in the state and provides the headquarters for agricultural extension work.

Most black college students are enrolled in traditionally black institutions, although an increasing number attend formerly all-white colleges. Among the several public and private black institutions, Tuskegee University, founded in 1881 and the home of Booker T. Washington and George Washington Carver, is the most well-known.

Higher education in Alabama suffers from duplication of effort caused by the overabundance of institutions, which dilutes resources. This duplication was the product of both a dual system for racial separation and a tendency to build schools as political favours. The state historically has not developed a strong mechanism for coordinating higher education.

Diversification in agriculture [margin note]

State and local government [margin note]

Health and welfare. In rural areas and among non-whites, educational and economic opportunities are fewer, and health and medical resources and services are less available. Welfare payments in Alabama rank low by national standards. Penal institutions include several prisons and camps for youthful offenders. Controversy over conditions in these institutions has occasionally existed, and substantial reform has been introduced since 1970.

Folk culture

Cultural life. Alabama enjoys a rich vein of folk culture in the rural areas, especially among blacks. Story telling has attracted the attention of folklore specialists. The experiences of rural life contributed important elements to the development of modern American popular music, including ragtime and jazz. Sacred music, in the form of gospel quartets and shape-note, or "fa-so-la," singing, remains a vital part of Alabama's cultural life. Quilt making is a highly developed folk art among rural dwellers, black and white.

Several Alabama writers have won attention through the exposition of themes in the state's settings. Johnson J. Hooper, John Gorman Barr, and Joseph G. Baldwin were popular local-colour writers in the 19th century. Booker T. Washington and Helen Keller wrote powerful and popular autobiographies in the early 20th century. The novelist William March made a distinguished literary contribution in his stories and novels in the 1930s and '40s, particularly *Company K* and *The Looking Glass.* T.S. Stribling, in a trilogy of realistic novels in the 1930s; Harper Lee, in *To Kill a Mockingbird* (1960); and Mary Ward Brown, in *Tongues of Flame* (1986), have explored social conditions, especially racial problems, in critically acclaimed works.

Art museums are found in Huntsville, Montgomery, Mobile, and Birmingham, the latter containing an especially impressive collection of American art. The George Washington Carver Museum at Tuskegee University has unique material on black history. The Sloss Furnace Museum focuses on Birmingham's industrial history. The Alabama Space and Rocket Center in Huntsville explores the development of space travel. The Alabama Shakespeare Festival in Montgomery offers professional productions of classic and modern plays.

Special library collections include those on medical history at the University of Alabama Medical Center in Birmingham; the Booker T. Washington Collection of black history material at Tuskegee University; and the Alabama and Southern history material at the Alabama Department of Archives and History, founded in 1901 as the first such department established in the United States.

Several historic places in Alabama are supervised by the state, including the Mound State Monument in Hale county, an important site for Mississippian Indian culture; and Fort Morgan, a Confederate fortress standing at the entrance to Mobile Bay. Alabama boasts many surviving examples of 19th-century residential architecture, perhaps most notably Gaineswood Mansion in Demopolis. The U.S. Park Service has made parts of Tuskegee University a national park for the study of black history.

Distinctive festivals are celebrated in various Alabama places. Mobile's Mardi Gras is a major event in February, as are its springtime Azalea Trail garden tours and the annual Junior Miss Pageant. Birmingham explores international culture in its annual spring Festival of Arts. The town of Opp hosts a yearly Rattlesnake Rodeo that draws large participation. Most Alabama towns and cities sponsor historical pilgrimages in April to celebrate architectural survivals.

The state maintains many parks and several large public lakes. Waterskiing, boating, and stock-car racing rank among the most popular recreational activities among Alabamians. The Alabama International Speedway at Talladega attracts hundreds of thousands of auto-racing enthusiasts each year. Three dog-racing tracks draw many bettors. College football, especially the teams fielded by the state's two major universities, elicits avid devotion from a large proportion of the state's residents.

HISTORY

The Indians. The earliest and longest established inhabitants of the present-day state of Alabama were Indians.

Visible traces of their occupancy, which spanned almost 10,000 years, may be seen in the great mounds that snake across the landscape near the river valleys. Many place-names in the state also indicate an Indian origin. The name Alabama itself derives from an Indian word meaning "thicket clearers." The principal Indian groups at the time of the initial European exploration of the region were the Chickasaw, in the northwest; the Cherokee, in the northeastern uplands; the Upper Creek, or Muskogee, in the centre and southeast; and the Choctaw, in the southwest.

European rivalry, settlement, and growth. The first known European explorers were of Spanish descent and arrived at Mobile Bay in 1519. The main thrust of exploration came in 1540, when Hernando de Soto and his army of about 500 men entered the interior from the valley of the Tennessee River to search for gold. His expedition, which extensively crisscrossed the area, was important because of his discovery of the Mississippi River, the knowledge he gained of a wide band of southern Indian cultures, and his role in opening up the whole region to European settlement. A battle with the ill-equipped warriors of the Indian chief Tuscaloosa, however, resulted in the slaughter of several thousand Indians; it may have been the bloodiest single encounter between whites and Indians in North America. De Soto found no gold, and subsequent Spaniards failed to establish settlements in Alabama.

The
de Soto
expedition

The ensuing 250 years were characterized by struggles among the French, British, and Spanish for control of the region, often in shifting alliances with the Indians of the area. In 1702 the French founded the first permanent European settlement in Alabama at Fort Louis, north of present-day Mobile. The British had also made a number of trips to the region from the Carolinas, but the French settlements—part of a string of forts arcing down from Canada and designed to contain the British—were more numerous. Port Dauphin, on Dauphin Island, received the first Africans when a slave ship landed there in 1719.

The Treaty of Paris (1763) gave to Britain what was then the only settled part of Alabama, the Mobile area. In another Treaty of Paris (1783), which officially ended the American Revolution, Spain gained Mobile, and the new United States received the rest of the present-day state. Then in 1813 the United States, claiming Mobile as a part of the Louisiana Purchase of 1803, drove the Spanish out of the area and established authority throughout the state. As for the Indians, the Cherokee, Chickasaw, and Choctaw had ceded some land by 1806. In 1814 General Andrew Jackson inflicted a decisive defeat on the Creek at the Battle of Horseshoe Bend. The influx of white population following these actions and the institution of the cotton economy caused a rapid removal of the Indians to the west. The Creek cession of 1832 virtually ended the Indian claims to territorial rights in Alabama. Most descendants of Alabama Indians live in Oklahoma; only a few hundred Creek remain in the southern part of Alabama.

The antebellum period. Alabama was established as a separate territory in 1817 and became a state in 1819. By 1820 Alabama's population was more than 125,000, including about 500 free blacks. By 1830 there were 300,000 residents, 38 percent of them slaves, and cotton was the principal money crop. Until the Civil War, domestic politics centred on the removal of the Indians, land policy, the banking system, and the question of slavery. The state suffered severely for almost a decade in the economic depression that followed the panic of 1837. During the late 1840s and '50s many efforts were made to create a more modern, industrialized economy. Railroads, cotton manufacturing, and some mining were begun, though such efforts often suffered from a shortage of capital. The vast majority of investment remained in cotton and slaves. By 1860 the population was almost 1,000,000; nearly half of the people were black, and all but 5 percent of the state's population was rural.

The Civil War and its aftermath. In 1861 Alabama seceded from the Union and joined the Confederate States of America, which established its first capital in Montgomery. The state legislature conscripted soldiers and appropriated several million dollars for military operations and for the support of the families of soldiers. Some 35,000 of the

122,000 Alabamians who served in the war died. Following the collapse of the Confederacy and the refusal of the state legislature to ratify the Fourteenth Amendment to the U.S. Constitution, Alabama in 1867 was placed under military rule. The next year the state ratified a new constitution that protected the civil rights of blacks, and Alabama was readmitted to the Union.

Recon-
struction
and after

From 1868 to 1874 the state was in political turmoil. To many whites the Reconstruction period was tragic, but to many blacks it was a period of opportunity and hope. The Huntsville *Advocate* asserted, "This is a white man's government and a white man's state," and the Ku Klux Klan used terror to enforce that view. Among white Alabamians, a struggle ensued between those who defied the notion of blacks having political rights and power and those willing to cooperate with blacks and their Northern allies. Blacks demanded access to education and were given it, but most whites insisted that schools be racially separate. Although blacks participated in the constitutional conventions and in the state legislatures, their political power was not as strong as that of blacks in South Carolina, Mississippi, or Louisiana. In 1874 the white Democrats of Alabama, most of whom had been supporters of the Confederacy, regained control of the state political machinery. Blacks were rendered almost powerless until the Civil Rights movement of the 1960s. Throughout this period, however, some blacks worked diligently to stimulate political activity, to enlighten and influence their white fellow citizens, and to influence the state and federal governments to guarantee their political and social rights.

In 1875 a state constitutional convention was held and a new conservative constitution ratified. Subsequent conservative political efforts centred on restricting the participation of blacks in government, reducing expenditures and state services, and fostering the expansion of railroads and industry. By 1901, when another state constitution was ratified—this one disfranchising blacks—there was virtually no black participation in government, and a tide of social and political reaction was in full flood.

The economy recovered slowly from the devastation of the war. Sharecropping as a system of land tenure and labour relations emerged, and with it came even greater dependence on a single crop, cotton. Depressed agricultural conditions fanned a populist revolt among small farmers in the 1890s. After 15 years of delay from depression and capital shortages, cotton manufacturing and pig-iron production began to grow steadily in the state in about 1880, with a long interruption during the depression of the 1890s. By the turn of the century, however, Alabama was one of the more highly industrialized Southern states.

Emergence
of share-
cropping

The 20th century. In 1900 the state remained largely rural. The onset of the boll weevil in 1915 seriously damaged one-crop agriculture, forcing a diversification of the rural economy. Rural dwellers, mostly poor and black, began an exodus to Southern cities and to the North, where cheap foreign labour supplies had dried up during World War I. A factor in encouraging the out-migration of Alabama blacks was the pattern of racial segregation under the "Jim Crow" system, which was enforced legally and extralegally. The level of the state's black population began a slow decline, which reduced their numbers to less than one-third of the total population by mid-century.

The Great Depression of the 1930s made suffering virtually universal in the state. Many thousands of tenant farmers lost their credit when the price of cotton fell to its lowest point. Birmingham's industrial economy almost came to a standstill. Federal relief programs alleviated some problems, and the Tennessee Valley Authority created new economic activity in northern Alabama.

The defense buildup lifted the Alabama economy out of depression in the World War II years. Statewide, the war did more to encourage industrialization than any other historical factor. After the war the contributions of the federal government in support of agriculture and national defense, including the space program, and the provision of such services as road building, education, and welfare, helped to transform the state's economy. The mechanization of agriculture in the 1940s and '50s completed the revolution in the state's agricultural economy.

Segregation, nevertheless, continued to give rigidity to the social framework of Alabama and effectively excluded the black population from social and economic power. The 1954 U.S. Supreme Court decision declaring segregation in public education unconstitutional encouraged black Alabamians to work to improve race relations. Progress was nevertheless slow and bitter. The state acquired international significance as the site of such noteworthy civil rights actions as the bus boycott of 1955–56 in Montgomery, which introduced Martin Luther King, Jr., to the nation; the "freedom rides" of 1961; street demonstrations in Birmingham in 1963 in which commissioner of public safety Eugene Connor turned fire hoses and police dogs on black protesters; Governor George C. Wallace's defiant attempt to stop the desegregation of the state university that same year; the death of four black Birmingham children in an explosion that destroyed their Sunday school, also in 1963; and the march from Selma to Montgomery in 1965.

The Civil
Rights
movement

This period of black activism precipitated major revisions in American law. The Civil Rights Act of 1964 finally ended segregation in public accommodations and provided protection against some forms of employment discrimination. The Voting Rights Act of 1965 outlawed most means of limiting the political rights of blacks.

As a result of these activities, black citizens have attained better access to public services, broader educational and economic opportunities, and freer political participation. By the late 20th century the percentage of blacks registered to vote had increased fivefold. Blacks have been elected in small but increasing numbers to state and local government positions. Job opportunities in some professions and in government have improved markedly for blacks, though poverty in the state is still disproportionate among blacks. Many professional and civic bodies and most schools have achieved a good measure of desegregation, though churches have not. Progress has been sometimes slow and incomplete but nevertheless significant.

(C.G.G./R.J.No.)

Arkansas

Ever since Arkansas was admitted as the 25th member of the United States in 1836, its people have maintained a remarkable homogeneity, and today most of them are native to the state. Striking cultural contrasts exist within Arkansas, however, with the long-isolated mountain people who eked out subsistence livings in the north and west counterposed to the people to the east and south who created a Southern environment in which cotton growing and sharecropping long were the dominant modes of economic life. Between the two regions lies Little Rock, the capital and the urban and economic centre of the state. Its location and increasingly cosmopolitan character are symbolic of Arkansas's growing unification and urbanization.

Arkansans are concerned about the state's relative poverty and lack of development. Although Arkansas remains among the lowest-ranking states in income per capita and other economic indicators, the overall economy in recent years has gained faster than the national average, and the population has increased, reversing a long decline. Programs have been developed to increase these trends and to continue the process of equalizing the educational, economic, and social opportunities of the state's citizens.

Arkansas's 53,187 square miles (137,754 square kilometres) make it 27th in area among the states, but, except for Louisiana and Hawaii, it is the smallest state west of the Mississippi River. Its neighbours are Missouri to the north, Tennessee and Mississippi to the east, Louisiana to the south, Texas to the southwest, and Oklahoma to the west. Arkansas has the high Ozark and Ouachita mountains in the north and west and a heavy tracery of rivers that cut through its rich agricultural lands. Nearly all of the rivers flow from northwest to southeast and empty via the Arkansas and the Red into the Mississippi, which forms the major eastern boundary. The state's name was used by the early French explorers for the Quapaw Indians and the river along which they settled. It probably was a phonetic spelling of the Illinois term for "downriver" people, a reference to the Quapaw.

The land. *Relief.* A line drawn from the southwestern corner to the northeastern corner of the state approximates the division between the highlands lying west and north and the lowlands lying south and east. The highlands are divided by the Arkansas River valley into the Ouachita Province on the south and the Ozark Plateau on the north. The lowlands include the Mississippi alluvial plain in the east and the western Gulf Coastal Plain in the south and extreme southwest. The highlands are covered with the dense pine and hardwood forests of the Ouachita and Ozark national forests.

The Ozark Plateau is broken by broad, flat-topped ridges and steep valleys with fast-flowing streams. The more rugged southern edge, known as the Boston Mountains, contains the highest elevations. Excellent farmland, producing a wide variety of crops, lies in the northern part. The Arkansas River valley contains the highest point in the state, Mount Magazine, at 2,753 feet (839 metres) above sea level. The western section has extensive coal and natural gas deposits. Several peaks in the Ouachita Province reach 2,500 feet. The mountains are eroded, exposing faulted rock, and the ridges extend west and east. The famous Hot Springs National Park is in this area.

The western Gulf Coastal Plain has gentle hills suitable for livestock grazing and farming. Much of this area consists of pine and white oak forests, which sustain lumbering industries. Petroleum and natural gas deposits have been developed in the Smackover and El Dorado area. The Mississippi alluvial plain, much of which was once a vast swamp, is now well drained and protected against flooding. It contains the state's richest and most fertile farmland. Rice and soybeans have replaced cotton as the major crops. A long, narrow chain of hills, Crowley's Ridge, runs north–south through the centre of the plain.

Climate. The climate generally is mild in winter and hot in summer. Normal high and low temperatures in Little Rock in January are 51° and 29° F (11° and −2° C); in July they are 93° and 71° F (34° and 22° C). The normal annual precipitation of 49 inches (1,250 millimetres) is distributed about equally during the year, though summers tend to be drier than the other seasons.

Plant and animal life. A great variation in soils and elevations in Arkansas supports a large number of plant species. There are more than 200 species of trees, of which

pine, oak, hickory, maple, gum, ash, cypress, and elm are the most important. In fall and spring the woodlands are colourful with dogwood, flowering fruit trees, redbud, and innumerable wild flowers.

Arkansas is situated on the Mississippi flyway; migratory water birds and some 300 native species attract hunters to the rice fields and reservoirs of eastern Arkansas. Deer, quail, opossums, turkeys, squirrels, and rabbits are among the more abundant game animals. Bobcats and wolves are not uncommon in the hill country. The lakes and streams of the state offer an abundance of fish, including crappie, bass, drum, catfish, buffalo, gar, and trout.

Settlement patterns. The inhabitants of the Ozarks and Ouachitas once lived in rural isolation, which bred an independence of spirit and a suspicion of strangers. Hunting and fishing were essential to supplement the limited produce of their farms. Since a plantation economy was impracticable in the uplands, few slaves were brought into the region. Settlement of the westernmost regions was long discouraged by the lawless frontier border with Indian Territory. Much of this area remains timbered and lies within the Ouachita and Ozark national forests.

In eastern Arkansas the plantation economy produced a vast gulf between the sharecroppers and tenants on one end of the social scale and the managers and landlords on the other. The owners of small farms or businesses constituted another class. The croppers lived a bare and meagre existence. Handicapped by lack of economic resources and education, they accomplished remarkable results through the Southern Farm Tenants Union, which they organized in eastern Arkansas in the 1930s; this organization influenced the national farm policy of presidents from Franklin D. Roosevelt onward.

Although changes in the economy were evident earlier, the rate of change since World War II has been dramatic. The Ozarks are no longer isolated. A network of paved highways brings tourists to enjoy the region's scenic beauty and varied recreational activities. Numerous "retirement villages" attract visitors and buyers from across the country. The tourist industry remains the economic mainstay, though small industrial plants have taken advantage of the climate and the ample labour supply.

Mechanization of farming in eastern Arkansas and the shift from cotton farming to rice and soybeans has virtually eliminated the sharecropper—though not the rural poor. As the pace of mechanization increased, so did the exodus of the tenant farmers to cities in the North and East. Farming is increasingly a corporate venture. Eastern Arkansas is still, however, more Southern in character than the mountainous region. The shacks of the sharecroppers are gone, and much of the rural population has left the state or moved to nearby towns offering nonfarm employment. In eastern and central Arkansas reside the majority of the state's blacks, many of whom still work the land as their ancestors did.

Little Rock, the major port on the Arkansas River, lies among the easternmost foothills of the Ouachita Mountains. A marketing centre and the site of manufacturing facilities, the city has completed or undertaken several urban renewal projects in its downtown area, including the construction of a pedestrian mall, the renovation of historic buildings, and the expansion of convention facilities. At the western boundary of the state lies Fort Smith, the second largest city on the Arkansas River. It is one of the most industrialized cities in the state and serves as a regional business and service centre. The economy of Pine Bluff, some 50 miles (80 kilometres) downriver from Little Rock, depends primarily on the surrounding agricultural area. Texarkana, contiguous with the Texas city of the same name, is an important regional rail centre.

The people. Prior to the Civil War, Arkansas's population came largely from Kentucky and Tennessee, a part of the westward movement of Scottish, Scotch-Irish, and English stock from Virginia and the Carolinas since early colonial times. The black population in 1860 was about 110,000, or 25 percent of the total; by the late 20th century there were more than 350,000 blacks living in Arkansas, making up a decreasing percentage of the total population. A few counties in eastern Arkansas are

more than 50 percent black. The heaviest concentrations of population are in the fertile eastern alluvial plain, in the river valleys, and on the plateaus in the northwest.

The largest religious denominations are the Baptist, United Methodist, Presbyterian, Church of Christ, and Roman Catholic. The religious atmosphere is one of conservative fundamentalism, and Arkansas is considered a part of the Bible Belt. Fundamentalism underlies many characteristic attitudes of Arkansans. The sale of alcoholic beverages is subject to local option; many counties and cities prohibit their sale or permit it only in private clubs and certain other establishments in major cities. The right-to-work amendment to the state constitution in 1944, which prohibits compulsory union membership, was sponsored by the Christian Association. Harding College in Searcy is the site of an annual Freedom Forum, which advocates a blend of religious fundamentalism, extreme patriotism, and free-enterprise capitalism.

The economy. Cotton is no longer king in Arkansas, and the state is no longer primarily agricultural. Industrialization and urbanization are major factors in Arkansas's recent record of economic progress. Labour unions are strong in transportation, utilities, construction, and heavy industry, but most of the state's labour force is unorganized. In both political and economic policy-making, labour is less influential than business.

The demand for increased revenue has led to cooperation between leaders in the private sector and public agencies in the promotion of economic growth. Progress in overhauling the state tax structure and in improving methods of tax collection has been slow but steady. The state attempts to generate more revenue by raising income per capita through increasing employment opportunities and developing human resources to their maximum.

Resources. Oil fields in southern Arkansas yield natural gas and bromide salts. Coal of a nearly smokeless quality, as well as natural gas, are found in the Arkansas River valley. Arkansas's aluminum industries have reduced substantially their bauxite mining operations and have closed some of their reduction plants. Experimental use of lignite in coal-fired electrical generating stations offers the possibility of extensive commercial development of the widespread lignite deposits in southern Arkansas. Magnet Cove, near Hot Springs, contains more than 40 different minerals in one small valley; barite and titanium are the most important. Arkansas whetstones made from novaculite are regarded as among the finest in the world. Near Murfreesboro, in southwestern Arkansas, is the only diamond mine in the nation, now operated only as a tourist attraction. Almost one-half of Arkansas is covered with forests, including extensive stands of pine and white oak.

Hydroelectric power is produced at dams erected by the U.S. Army Corps of Engineers and by private companies. Two nuclear power plants have been constructed near Dardanelle, and coal-fired stations have also been built.

Agriculture and industry. Cotton remained the major source of agricultural income into the 1960s. Since then rice and poultry, of which the state is a leading producer, have dominated. Other important crops are soybeans and grains. Commercial fish farming has begun to take advantage of the extensive rice paddies of eastern Arkansas. Farms have followed the national trend of increasing in size while decreasing in number.

Manufacturing chiefly involves the production of consumer goods. Major industries include food processing and the manufacture of clothing, furniture, electrical and nonelectrical machinery, electronic equipment, and fabricated metal products.

Transportation. Several major railroads provide freight service within Arkansas, as well as to major cities in the central United States. Airline service is provided by national carriers from a number of airports to any point in the nation. By interstate highways more than half of the nation's population is within a two-day driving radius of Arkansas. Motor-fuel tax revenues are reserved for public highways and streets. As funds are available, major routes are being rebuilt as four-lane, limited-access roads.

The McClellan-Kerr Arkansas River Navigation System for navigation and flood control is the largest civil works project ever undertaken by the U.S. Army Corps of Engineers. The project provides access to more than one-half of the nation's navigable inland waterways. Annual freight tonnage along it has exceeded estimates, and significant industrial growth has been attributed to the project.

Administration and social conditions. *Government.* Adopted in 1874, Arkansas's constitution has been amended more than 70 times. The governor, who is elected to a four-year term, has the authority to summon the legislature into special session and to veto acts, though a veto may be overridden by a simple majority vote in each legislative house. The Senate has 35 members with four-year terms; the House of Representatives, 100 members with two-year terms. The judicial branch includes the Supreme Court of seven popularly elected members who serve eight-year terms, a court of appeals, and circuit and chancery district courts. Where established, municipal courts have jurisdiction throughout the county.

Elected officials of the 75 counties include county judge (chief executive), clerk, treasurer, sheriff-collector, surveyor, and coroner. In each county, elected justices of the peace make up a quorum court, which serves as an advisory body to the judge and exercises some legislative functions. There are many local improvement districts and school districts. Although a number of incorporated cities have a city-manager form of government, the traditional mayor–council form is most common.

Arkansas is a predominantly Democratic state. Since Reconstruction, few Republican governors or congressmen have been elected, although the Republicans have gained strength. Unless a candidate receives a majority of votes cast in a preferential primary, a runoff is required. Permanent voter registration replaced the poll tax in 1965.

Education. The public school system functions under the state's department of education and district school boards. Specialized institutions include schools for the deaf and the blind. The state's facilities for retarded children and for the treatment of mental illness have attracted nationwide acclaim. Vocational-technical schools serve most areas of the state. In addition, private schools, most of them church-related, offer instruction from kindergarten through the secondary level.

The University of Arkansas has a main campus at Fayetteville and branches at Little Rock, Pine Bluff, and Monticello. The graduate schools of health sciences, technology, and social work are located in Little Rock. Several other universities and two-year colleges are supported by the state. Some of these were developed from institutions for the agricultural and mechanical sciences and for teacher training. There are also several private and church-affiliated colleges and universities.

Health and welfare. Problems of malaria, pellagra, and pinworm that once plagued the region have been virtually wiped out by widespread efforts of state and local health authorities. The state departments of health and human services administer many programs funded in part by the federal government. Emigration of young people over the past several decades has aggravated health and welfare programs, especially in declining rural areas. Welfare payments are among the lowest in the nation. The mild climate and attractive scenery has fostered the establishment of retirement villages in the Ozarks.

The wages of Arkansas's workers are among the lowest in the nation, and living costs approximate those of the south central region. Blacks live at distinctly lower economic and social levels despite improvements.

Cultural life. The people of eastern Arkansas are typically Southern in their speech and customs. Central Arkansas also reflects its Southern heritage, but the speech and manners of its people have been influenced by immigrants from other parts of the country. The rural areas of the Ouachitas and Ozarks have retained to the fullest degree an unchanged culture.

The fine arts are well served by semiprofessional orchestras, choral groups, and ballet, theatre, and opera companies in Little Rock and other urban centres. Most colleges and universities offer training and performance in the arts. A four-state opera workshop is held each summer in the Ozarks. Arkansas's richest contributions are in

Marginal notes:

Political life

the folk arts of the Ozarks. A major folk art centre in Mountain View has been designed to provide a showcase for local and visiting performers in dance and music; to preserve traditional skills in ceramics, jewelry, wood carving, hooked rugs, and basketry; and to offer instruction in the native folk arts. Other aspects of folk culture include the gospel singing of rural areas. Black spirituals and soul music flourished in Arkansas long before they became popular nationwide.

The University of Arkansas has a fine collection of archaeological and historical artifacts. A collection of colonial glassware is featured in the Museum of Science and History, housed in the old federal arsenal in Little Rock. The Arkansas Arts Center and its branch for the decorative arts, located in a restored antebellum mansion, have attracted regional recognition. Historic sites include Arkansas Post, the first European settlement in French Louisiana; Washington, the Confederate state capital during the Civil War; and the Territorial Capitol Restoration and Old State House in Little Rock.

Arkansas devotes considerable effort to attract out-of-state vacationers, who annually contribute millions of dollars to its economy. State and national agencies stock lakes and streams with fish, and the state's preserves and conservation practices assure ample game in hunting seasons. The largest single attraction in Arkansas is Hot Springs National Park, which offers both outdoor recreation and luxury hotels throughout the year. The Buffalo National River, Blanchard Springs Caverns, and the resort town of Eureka Springs, known for its arts community and Victorian architecture, attract thousands of visitors annually. In addition to the five national park sites, there are numerous state parks affording a great variety of recreational activities.

Little Rock has the oldest newspaper west of the Mississippi, the *Arkansas Gazette,* founded in 1819; like the *Arkansas Democrat,* it serves the entire state. Central Arkansas is served by radio and television affiliates of the major networks. The state has numerous commercial radio stations. The Arkansas Educational Television network covers most of the state, and cable television serves urban communities.

HISTORY

Exploration and settlement. Arkansas's early inhabitants included bluff-dwelling Indians, whose farming and hunting culture flourished about AD 500. Later mound-building cultures left sepulchral mounds and other remains along the Mississippi.

Spanish and French explorers traveled the trans-Mississippi regions in the 16th and 17th centuries, and the Frenchman Henri de Tonty founded the Arkansas Post on the lower Arkansas River in 1686. The first permanent white settlement in what is now Arkansas, it served as a fur-trading centre and a way station for travelers between the Gulf of Mexico and the Great Lakes.

Following the Louisiana Purchase by the United States in 1803, Arkansas lay within the territories of Louisiana until 1812 and of Missouri until 1819, when it became a separate territory. Its northern boundary, latitude 36°30′ N, was the line of the Missouri Compromise in 1820 that later separated the slave and free states in the West.

Statehood and Civil War. By the time of statehood in 1836, all land titles of the Quapaw, Osage, Caddo, Cherokee, and Choctaw Indians had been withdrawn by the U.S. Congress, and the tribes were forced westward into the Indian Territory, the future Oklahoma. Violence broke out intermittently along the state's western border until the late 19th century, when the frontier atmosphere disappeared with the white settlement of the Indian Territory.

Although a slave state, Arkansas did not secede from the Union until May 1861—five months after South Carolina
did so. Arkansas took this action only after the Confederate capture of Fort Sumter and President Abraham Lincoln's call for volunteers. Union sentiment was strong in northern Arkansas; about 6,000 Arkansans joined the Federal forces. About 58,000, however, fought for the Confederacy. Little Rock fell to Federal troops in 1863, and for a decade the state was a legislative battleground

between secessionist supporters and the imposed Republican government. Arkansas was readmitted to the Union in 1868, but internal strife approached open warfare. In 1874 the state returned to the fold of the Democratic Party, and remained there until Winthrop Rockefeller, a Republican, was elected governor in 1966.

The Civil War's chief long-range effects on Arkansas, as on most of the other former Confederate States, were a crop-lien sharecropping system, a race problem of new and formidable dimensions, a one-party (Democratic) political system, and widespread poverty. Economic development in Arkansas was severely handicapped by the collapse of state credit following repudiation in 1885 of bonded indebtedness, including interest of nearly $14,000,000.

Recent decades. Until World War II, Arkansas experienced slow economic development, remained predominantly rural, and was tied to a single cash crop—cotton. The depression of the 1930s was worsened by years of drought that turned many farm families into itinerant labourers. Defense-related activities during World War II and the postwar mechanization of agriculture greatly altered both the economy and social patterns. Women entered the labour force, the pace of urbanization increased, farm tenancy decreased, and civil rights of minorities were granted. In 1957 federal troops entered Little Rock to maintain order after the state militia had been ordered to prevent the desegregation of one of the city's high schools; the confrontation focused international attention on the state. Since then private enterprise has developed nationally outstanding state-based companies in retail merchandising, poultry products, computer software, and finance brokerage.   (B.A.D.)

Florida

The geographic location of Florida has been the key factor in a long and colourful development, and it helps explain the striking contemporary character of the state. The greater part of Florida lies on a peninsula that protrudes southeastward from the North American continent, separating the waters of the Atlantic Ocean from those of the Gulf of Mexico and pointing toward Cuba and the Caribbean Sea beyond. Florida shares a border with only two states, Georgia and Alabama, both to the north. Its capital, Tallahassee, is located in the northwestern panhandle. The nearest foreign territory is the Bahamian island of Bimini, some 50 miles (80 kilometres) to the east of the state's tip. With the exception of Hawaii, Florida is the southernmost state of the United States, its northernmost point lying 100 miles farther south than California's southern border. The Florida Keys, a crescent of islands that forms the state's southernmost portion, lie within 1,700 miles of the equator. Florida, admitted as the 27th state in 1845, has an area of 58,664 square miles (151,939 square kilometres).

The state lies close to both the geographic and the population centres of the landmass of the Western Hemisphere, and its position not only commands one entrance to the Gulf of Mexico but also lies along a strategic crossroads between North and South America and historic routes to the European and Mediterranean worlds. Florida played a prominent role in the struggles of the European powers to control the New World, and it is fitting that St. Augustine, founded in 1565 on its northeastern coast, is the oldest European settlement within what were to become the boundaries of the continental United States.

Although agriculture and manufacturing continue to be important in Florida, the climate and scenery of the "Sunshine State" have attracted enormous numbers of visitors, and tourism is now a mainstay of the well-diversified economy.

PHYSICAL AND HUMAN GEOGRAPHY

The land. *Relief.* Florida is a geologically young, low-lying plain, mostly less than 100 feet (30 metres) above sea level. The highest point is in Walton county, a mere 345 feet (105 metres) above sea level. Sedimentary deposits of sand and limestone cover most of the state, with areas of peat and muck marking locations where freshwater bodies

once stood. The contemporary topography has been largely molded by running water, waves, ocean currents, winds, changes in sea level, and the wearing away of limestone rocks by solution. These forces have produced enough variation in the state's surface to permit classification into seven basic physiographic regions: the coastal lowlands, the Lake Okeechobee–Everglades basin, the Kissimmee lowlands, the Marianna lowlands, the central highlands, the Tallahassee hills, and the western highlands, though these divisions are scarcely apparent to the naked eye.

The coastal lowlands occupy approximately 75 percent of the surface and vary in width from 10 to 100 miles. Generally, the region is very flat and in places less than 25 feet above sea level. Much of the area is swampy, and in the eastern part of the state numerous former beach ridges parallel one another. Offshore barrier beaches (bars) rim much of the region and account for most of Florida's excellent beaches.

The Lake Okeechobee–Everglades basin and the Kissimmee lowlands are actually subdivisions of the coastal lowlands, but their uniqueness justifies separate designations. The former is 150 miles long and 50 miles wide and is actually a shallow, slow-moving river (the "River of Grass"). The northern portion has been modified with canals, dikes, and pumping stations and is Florida's principal zone of sugarcane production. The southern portion retains much of its pre-European flavour and is protected within the confines of the Everglades National Park. The Kissimmee lowlands are approximately the size of the Lake Okeechobee–Everglades basin and include the broad valley of the Kissimmee River, the major source for water flowing southward to Lake Okeechobee. Much of this region is a flat grassland dominated by pastures and cattle ranches.

The Marianna lowlands is a small region in the northwestern panhandle, bounded on the east by the Apalachicola River and on the west by the Choctawhatchee River. The region is heavily eroded and has numerous sinkholes and caves.

The Marianna lowlands separates the Tallahassee hills, to the east, from the western highlands, which extend to the Alabama border on the west. Both of these regions are about the same size (40 by 100 miles), and both are ancient upland plains that have been dissected by streams. They form beautiful rolling country that, combined, is the most important zone for the production of field crops in Florida.

The central highlands lie between the Suwannee River, on the eastern side of the Tallahassee hills, and the St. Johns River, which separates the highlands from the eastern coastal lowlands. The region extends southward from the Georgia border to the area of Arcadia and Sebring, a distance of some 400 miles; the width varies from 50 to 75 miles. The region is rolling and dotted with thousands of lakes, and the central and southern portions contain most of Florida's citrus acreage.

Drainage.   The flat Florida landscape is covered by a latticework of some 1,700 named streams (mostly in the north and northwest) and about 30,000 named lakes (mostly in the central region). The state also contains 17 of the 75 first-magnitude artesian springs in the nation, most of them located in the central region. There are some 39 drainage basins, with the Lake Okeechobee–Everglades basin (17,000 square miles [44,000 square kilometres]) being the largest. Lake Okeechobee (700 square miles) is the third largest freshwater lake entirely in the United States (after Lake Michigan and Iliamna Lake in Alaska). This vast water network is fed by the state's porous limestone substructure, which stores large quantities of water.

Climate.   Climatically, Florida is divided into two regions. The tropical zone lies generally south of a westeast line drawn from Bradenton along the south shore of Lake Okeechobee to Vero Beach, while north of this line the state is subtropical. Summers are uniform throughout Florida. Freezing weather of short duration (but often crippling to agriculture) can occur as far south as Miami, but the Keys have never had frost.

Rainfall is heaviest in summer, with drier weather prevailing in the winter months. The average annual rainfall ranges from 40 inches (1,000 millimetres) in Key West to 62 inches in West Palm Beach. Snow falls occasionally in the northern areas and has been reported as far south as Miami. Hurricanes occur about once a year on the average, although Florida is no more vulnerable to hurricanes than are the other Gulf states or, indeed, the entire Atlantic coast as far north as Boston. The hurricane season is from June to November, though September is the month during which they are most likely to occur.

Average annual temperatures show little variation, ranging from 68° F (20° C) in Tallahassee in the north to 77° F (25° C) at Key West in the south. Corresponding monthly averages range from the middle 40s F in the north to the middle 50s F in the south in January, and are in the lower 80s F in August.

Soils and plant life.   In general, Florida's soils consist of sand, sandy loam, claylike marl, peat, and muck, but more than 300 soil types have been mapped. More than 300 species of trees have been identified; about half of the state is covered by forests. The dominant trees include pines, oaks, cypresses, palms, and mangroves. Many tropical trees thrive in southern Florida, while beech, red maple, sweet gum, tulip, magnolia, and hickory are common in the north. Almost half of the species of trees found in the United States grow in Florida. More than 3,500 other plants have been identified, including many plants imported into the state.

Six broad soil–vegetation regions may be described. (1) The flatwood lowland soils form the largest soil region in Florida, which corresponds to the coastal lowlands. The terrain there is level and underlaid by a hardpan that impedes drainage and encourages flooding; slash and longleaf pine, oak, sabal palm, and grass are typical vegetation. (2) Organic soils are found in many parts of Florida, particularly in the Lake Okeechobee–Everglades basin, where saw grass, cypress, sabal palm, myrtle, willow, elderberry, and gum are important vegetation. In this soggy environment submergence often prevents the oxidation, decay, and shrinkage of peat and muck, but when the soils are drained they deteriorate rapidly. (3) Southern limestone soils occur in the Kissimmee valley, the Big Cypress Swamp, and the Miami–Homestead area. Pines and oaks grow in some areas, but grasses, along with saw palmettos and sabal palms, predominate in the Kissimmee valley. The cypress, bay, and gumbo-limbo—a tall tree with a brown, brightly lacquered trunk—are typical of the extreme southern areas of this region. (4) Northern upland soils, from overdrained sands to well-drained loams, occur in the region stretching across the north of the state and support hardwoods, loblolly pine, and longleaf pine. (5) Northern slope soils, usually considered a distinct region, lie immediately to the south, with slash and longleaf pine, oak, and saw palmetto. (6) Central upland soils—with a vegetation similar to that found in northern slope soils—are located in the higher ridge area of central Florida, westward to the Apalachicola River. There are a number of other zones of soils and vegetation: dunes fringe the magnificent beaches of the state, while lush, dank mangrove swamps, along with tropical hardwoods and sand pine and oak, are found in the Ocala National Forest.

Animal life.   Florida's rich and distinctive tropical and subtropical environment is inhabited by a huge and varied wildlife population; the rarer forms, such as panthers and crocodiles, are fully protected. Approximately 100 species of mammal are found in the state, including deer, puma, bobcat, boar, black bear, armadillo, otter, mink, and gray fox; smaller animals are also numerous. Manatees (sea cows) are found along the coast and in warm inland waters, and several species of porpoises and dolphins lend their distinctive charm to the clear coastal waters.

More than 400 species and subspecies of birds have been identified; land birds include the turkey, quail, dove, eagle, hawk, owl, and most smaller birds common to the southeastern states, while such coastal birds as the gull, brown pelican, sandpiper, osprey, and cormorant are also numerous. Freshwater and marsh birds include the gallinule (marsh hen), duck, goose, coot, egret, heron, ibis (stork), and flamingo. There are vast natural rookeries in the Everglades, and numerous wildlife refuges are maintained for the protection of migratory birds.

The alligator is the king of Florida reptiles, its role as a builder of water holes being vital to southern Florida's ecology, while the crocodile still inhabits part of the Everglades National Park. The 40 species of snakes in the state include the nation's four poisonous types: the coral, rattlesnake, moccasin, and copperhead (the latter restricted to limited areas of northern Florida). Turtles, tortoises, lizards, and frogs are also abundant.

Florida's 4,000,000 acres (1,600,000 hectares) of water (of which some 2,800,000 acres are inland) contain more than 700 species of fish and shellfish. Common saltwater varieties are bluefish, pompano, flounder, mackerel, mullet, trout, redfish, snapper, grouper, snook, sailfish, tarpon, shad, weakfish, bonefish, marlin, and shark. Others include crawfish, oysters, stone and blue crabs, clams, and shrimp. The largemouth black bass is the state's foremost freshwater species, while others include bream (bluegill), sunfish, speckled perch, and catfish.

Settlement patterns. Northern and southern Florida are often distinguished as separate regions. Northern Florida is generally a colder, historically older, rural and hilly area, oriented toward field agriculture and forestry. Southern Florida is a warmer, flat, urban area, the more recently settled region of the state, with an economy based on tourism, citrus fruits, vegetables, and livestock. A refinement would add central Florida, with its lake region and citrus belt. A more scientific classification might identify the east coast, the west coast, central Florida, the Keys, the Everglades, and the panhandle. More popular regional names are the Gold Coast (the Miami–West Palm Beach metropolitan sprawl), the Sun Coast (the Tampa Bay area), and the Big Bend (centring on Tallahassee). Lesser-known designations include the Silver or Platinum Coast (a term applied to the lower southwest), the Island or Mangrove Coast (the extreme southwest), Suwanneeland (the Suwannee River basin), Miracle Strip (the upper northwestern coast), Florida's Crown (the northernmost part of the peninsula), the Surf Coast (the middle east coast), and the Tropi-Coast (Miami–West Palm Beach).

To a stranger entering the state from the north, the Florida landscape may appear devoid of human imprint. It is being used, but the use is of a type unfamiliar to many visitors. More than half of Florida is covered by commercial, national, and state forests, state and federal parks, lakes, beaches, and military reservations. Less than two-fifths of the state is farmland, and about one-third of this is in either pasture or timber. Only about one-fifteenth of Florida's total land is used for harvested crops.

The effect on the landscape is striking: farmsteads are

generally common in northern Florida, where field crops are important, but even there timber covers thousands of acres. Citrus groves occupy much of central Florida and the east coast, while along the west coast and north and south of the citrus belt spread vast expanses of cattle land. Around Lake Okeechobee, the cultivation of sugarcane and vegetables has produced the modern equivalent of plantation agriculture. The small, private farm has little place in these systems, having been superseded by mechanization and the use of migratory labour. The social conditions of migrant workers, which have occasionally given rise to national concern, remain one of the negative aspects of a generally affluent state. The rise of corporate agriculture has led to an inevitable increase in farm size and a corresponding reduction in farm numbers.

Even the small town seems to be disappearing, as more and more people find it relatively easy to commute from urban and suburban centres. The great majority of the people live in urban areas, and only a tiny percentage live on farms. The densest concentration is along the extensive Miami–Fort Lauderdale–Boca Raton–West Palm Beach urban complex in the southeast. This area appears to many observers to be duplicating the less desirable aspects of the great urban belts burgeoning in other parts of the nation. On the west coast the Tampa–St. Petersburg metropolitan area contains another concentration of population. Farther north the Daytona Beach–Cape Canaveral–Orlando triangle is central Florida's dominant urban area; Jacksonville is the major centre of the upper east coast and southeastern Georgia; and Pensacola dominates the western panhandle and part of Alabama. Lesser metropolitan areas—including Tallahassee, Gainesville, and Fort Myers—are hubs of local influence.

The people. *Ethnic groups.* Ancient Indian groups entered Florida from the north as early as 10,000 years ago, but farming did not appear much before 500 BC, and some southern Indian groups remained hunters, fishers, and gatherers until their extinction. Indians continued to arrive in small numbers after 500 BC, and contacts with Cuba, the Bahamas, and, possibly, the Yucatán reflected Florida's unique situation. By 1750 virtually all of these peoples had been destroyed by disease, slavers, and wars, largely the responsibility of English and Creek raiders from Georgia. The latter, accompanied by a few runaway black slaves and renegade whites, were collectively called Cimarrones. The name Seminole evolved from *cimarrón* (Spanish: "wild, unruly, runaway"). There were approximately 5,000 Seminoles in Florida when it came under formal U.S. jurisdiction in 1821. Within 25 years this population had declined to about 150, by which time most of the Seminoles had been removed to the territory of Oklahoma. By the late 20th century a small number of descendants of those who had remained were living in three reservations in southern Florida.

The first Spanish settlement, established in 1559, was abandoned in 1561, but San Augustín (St. Augustine), founded in 1565 after the destruction of the French settlement nearby, became the first permanent European settlement in the United States. For the next 250 years Florida was little more than a wilderness in terms of any permanent European settlement, though its importance as a historical pawn was considerable.

A large population of European origin did not develop until the United States established effective civil control in 1822, and the great increases of the late 19th and 20th centuries owed much to economic factors. Immigrants from northern Spain came to Tampa at about the time of World War I, drawn largely by the expanding cigar industry and the prospect of living in a Spanish-speaking community. Italians also came in large numbers after World War I.

Tarpon Springs was settled about 1880, and by 1905 Greek immigrants, drawing on the traditions of their homeland, had established the nation's major sponge industry. Greek is still widely spoken, and the city is a centre for the Greek Orthodox religion. Other ethnic contributions lending character to the overall population of the state range from a Jewish community at Miami–Miami Beach to a Slovak settlement at Masaryktown.

It is not known when the first blacks arrived in Florida, but it is known that some accompanied the first Spanish expeditions. A few runaway slaves came with the Seminoles, but it was only with U.S. rule that the black population began to increase. By 1830 there were as many blacks as whites (about 11,000). The increase of the black population coincided with the development of the Southern plantation system. The Civil War overthrew slavery, but the agricultural patterns remained, and not until the end of the 19th century did an influx of new settlers cause the white population to increase faster than that of the blacks. The black percentage of the total population continued to decline in the 20th century, though large percentages are still found in the old plantation belt (north central Florida) and in the Everglades truck-farming region.

Cubans in Florida   Cubans came to Key West after 1868 when, as a result of revolutionary turmoil in Cuba, Vicente Martínez Ybor moved his cigar factories there from Havana. Labour troubles and a disastrous fire encouraged Ybor to move again in 1886, this time to Tampa, and again many Cubans followed the factories. A similar influx occurred after the Cuban revolution of the early 1960s, when more than 350,000 Cubans fled their homeland. A third of these settled in Florida (mostly in the Miami area) during the decade. Still another wave of Cubans arrived in Florida in 1980, and about 80,000 were integrated (albeit uneasily) into the Cuban community around Miami.

Demography. The continued migration of older, retired people into the state has given Florida the nation's oldest population. The northwestern counties continue to grow more slowly than the southern urban areas. Those areas heavily dependent on military and space programs continue to be directly affected by federal budgetary decisions that influence such activities. Key West, for example, a Navy-oriented city, suffered a population loss of more than 35 percent between 1960 and 1980. Cutbacks in the space program created one of Florida's highest unemployment rates in the Cape Canaveral area.

The economy. Florida experienced little economic development before 1821, when the United States took formal possession. The 60 years that followed were dominated by small-farm and plantation agriculture; the supplying of naval stores and the production of beef and hides, pork, salt, tobacco, and cotton were the main activities. The 1880s marked the beginning of a new era in Florida. In 1881 phosphate—the state's most important mineral—was discovered in the Peace River valley, while in that same year Hamilton Disston, a Philadelphia industrialist, bought 4,000,000 acres in the Everglades for 25 cents an acre. This freed the state from its post-Civil War debt and opened the way for the development of much of the peninsula. In the west a railroad reached Pensacola

Role of Northern capital   in 1883, and in the following year another reached as far as Tampa; the line was financed by a Northern capitalist, Henry B. Plant. On the east coast his counterpart, Henry M. Flagler, was building a rail and hotel empire that soon extended past Miami to Key West. Agricultural development, settlement, industry, and tourism all followed the rails. The 1890 population of the state was double that of 1870, and the total passed 500,000 by the turn of the century and continued its spectacular growth thereafter.

Labour–management relations in Florida tend to follow the national pattern. Manufacturing, mining, communication, and transportation tend to be unionized; services are less so, while the professions and agriculture are generally nonunion. The cooperative movement is especially strong in citrus growing and commercial fishing. The Florida Citrus Mutual works closely with growers and the state in research, production, processing, marketing, and regulation, while there are several fishing cooperatives, primarily to help market the catch. The state government cooperates closely with the private sector of the economy; it is instrumental in inspection, licensing, regulation, and research and education, but the state rarely competes with private business.

Resources. Directly or indirectly, Florida's tropical and subtropical climate affects almost every aspect of the local economy, and it can be quite justifiably considered the state's chief resource. Together with land and water—

both of which have a rich potential for economic development—climate forms the basis of the state's wealth. The water resources, important to the fishing industry and tourism alike, include not only 4,424 square miles of fresh inland water but also an even larger area of adjacent salt water. In the United States only Alaska has a tidal shoreline whose length exceeds that of Florida, which totals 8,426 miles (Gulf coast, 5,095 miles; Atlantic coast, 3,331 miles). On land, forestry activities are supported by the half of the state (mostly in the north) that is wooded, and livestock raising is supported by the state's large grasslands (mostly in the central and southern areas).

Florida also yields several important minerals. Phosphate, which is used in fertilizer and livestock feed and by the chemical industry, is found in the west central portion of the state, and production there accounts for some three-fourths of the national total. Titanium, zircon, and such other important heavy minerals as thorium and cerium are mined near Jacksonville, Starke, and Vero Beach and in west central Florida. Petroleum is produced in the northwest and the southwest. Kaolin is mined in Putnam county; fuller's earth comes from the Tallahassee region; and clay, sand, and gravel are mined in numerous locations, with pure silica sand extracted mostly in areas around the 100-foot contour line. Limestone, from the northern portion of the peninsula, is used as building stone and road-surfacing material and in cement, concrete, and fertilizer; peat, used as a soil conditioner, is dug in many areas. The versatility of the marine resources of Florida is indicated by a plant at Port St. Joe on the Gulf coast for the recovery of magnesium from seawater.

Production of citrus fruit   *Agriculture.* Florida produces about three-fourths of the nation's citrus fruit and is second only to California in vegetable production. Citrus fruits, vegetables, and livestock each account for about 25 percent of farm receipts. Tomatoes are the leading vegetable crop. Sugarcane is the king of Florida field crops, and the state produces approximately 40 percent of the nation's total. Florida is also well known for its thoroughbred horses raised near Ocala.

Industry. As might be expected in a state dominated by tourism, the service industry is the most important employer, accounting for some 30 percent of all Florida jobs. Another 20 percent is in retail trade, also closely associated with the tourist industry. Manufacturing ranks third in employment but on a value-added basis exceeds all sectors but tourism. The electrical and electronics sector leads in manufacturing, followed (in order of importance) by printing and publishing, transportation equipment, food processing, machinery, metal fabrication, clothing, chemicals, and wood products. Together the manufacturing industries employ some 13 percent of the labour force. Other major industries in Florida include construction, finance, government, transportation, communications, and wholesale trade.

Tourism. Tourism is the largest income-producing activity in the state and has developed into a year-round business. The Atlantic and Gulf beaches that form the basis of the state's popular "vacationland" image are seldom the only destination for the Florida visitor. Other attractions include the large theme parks, professional and collegiate sporting events, golf, hunting and fishing, and an abundance of parkland, including two national parks, two national seashores, a national preserve, five national monuments and memorials, and numerous state parks.

Transportation. Florida's transportation system is comprehensive, covering the entire state except for certain isolated areas in the Everglades. In general, highway arteries run across the north of the state, from Jacksonville to Pensacola; down the east coast, from Jacksonville to Miami; diagonally across the state, from Jacksonville to Tampa–St. Petersburg on the west coast, bisecting the state from Tampa–St. Petersburg to Daytona Beach; and through the southwestern portion, linking Tampa–St. Petersburg to Miami. Rail and air traffic also follow these patterns. Although there is no direct Miami–Tampa railroad, there is a heavily traveled air route between the two cities.

The most heavily traveled throughways are the interstate and state turnpike systems that connect all major cities. There are several airports with regularly scheduled flights

and numerous private airfields; the international terminals at Tampa, Orlando, and Miami are among the most modern in the world. An extensive rail network provides passenger and freight service to most areas. An integrated system for domestic and foreign shipping is provided by eight major deepwater ports and several lesser ports and harbours, while more than 1,000 miles of navigable channel are maintained by the federal government.

Cape Canaveral

Florida has a spaceport, the John F. Kennedy Space Center at Cape Canaveral, which occupies 88,000 acres. This is not only a major Florida industry but has also become a prime tourist attraction.

Administration and social conditions. *Government.* The basis of Florida's government was laid in the constitution of 1885, to which, through the years, about 100 amendments were ratified. Twenty articles of the constitution were formally revised in 1968 and ratified by the people in the 1968 general election. There are a number of important constitutional prohibitions and tax exemptions, including prohibition against an income tax and inheritance tax and exemptions that relate to homesteads.

The executive department comprises the governor and an independent cabinet of six officers (secretary of state, attorney general, treasurer and commissioner of insurance, comptroller, commissioner of education, and commissioner of agriculture). The governor and members of the cabinet each serve four-year terms, with a consecutive limit of two. The legislature is composed of the Senate of 40 members and the House of Representatives of 120 members. Senators serve four-year terms and House members serve two-year terms.

Judiciary powers are exercised through courts established by the constitution: the Supreme Court, five district courts of appeal, 20 circuit courts, and 67 county courts. Appellate judges are initially appointed by the governor; other judges are elected to office on a nonpartisan ballot.

Political trends

Although Florida has become a two-party state in some respects, Democrats continue to outnumber Republicans in the legislature. Top-level state executive offices and seats in the U.S. Congress are also most often held by Democrats. Nevertheless, Florida has elected Republican governors since the 1960s and typically votes Republican in presidential elections.

Florida has no state income tax on individuals but does tax corporate income, which produces about 9 percent of the total tax revenue. Approximately two-thirds of the total comes from the general sales and use tax. The remainder derives from special taxes on a wide range of items, including unemployment compensation, gasoline, motor vehicles and mobile homes, alcoholic beverages, cigarettes, utilities, insurance premiums, pari-mutuel wagering, and inheritances. A state lottery, established in 1988, offered a new source of revenue.

Education. Florida supports the public school system to the extent that no child is deprived of a minimum standard of education, while the counties are expected to supplement this minimum. Virtually the entire population of Florida is within commuting distance of a state-supported college or university, part of an extensive system of higher education. There are nine state-supported universities, several of which offer courses on multiple campuses. In addition to the university system, Florida maintains several community (junior) colleges, all of which offer the first two years of university-equivalent courses in addition to terminal programs in technical areas. Private sources support other institutions of higher learning, ranging from small, highly specialized schools to major universities, such as the University of Miami.

Health and welfare. Socially, Florida regards itself as a progressive state, and a major proportion of the state's financial resources go into those areas that serve the public, with education, welfare, health, and hospitals receiving about two-thirds of the total appropriations.

The Department of Health and Rehabilitative Services (HRS) is charged with programs of direct assistance to the public. Included are aid to families with dependent children, old-age assistance, aid to the blind, and aid to the disabled. HRS is also responsible for child welfare, including child neglect and abuse. Florida's expenditure per capita for health and hospitals exceeds the U.S. average and is among the highest of those of the heavily populated states. Public welfare payments, on the other hand, are among the lowest in the nation. Florida ranks at the bottom of all Sunbelt and populous states in this respect. In part, this is a reflection of the public's refusal to offer welfare to the needy of other states who seek refuge in Florida's tropical and subtropical environment.

Florida's favourable climate and geographic position has led to two types of migration: elderly persons come to Florida from the North, and political and economic refugees enter the state from Latin America. Both of these movements have severely taxed the state's ability to support the needy. A large percentage of the population of Florida is over 65 years of age, and the population is continuing to become older. This development requires that numerous support programs be increased. There is, however, also a burgeoning young population that has resulted from the mass immigration of peoples from Latin America. This group makes additional, but different, demands on the state for education, family assistance, and public safety.

In total personal income, Florida ranks among the top states nationwide and ranks relatively high in income per capita. There are no serious labour shortages in Florida except in a few highly skilled and professional occupations and, at certain times, in service occupations. Unemployment in Florida usually runs below the national average, and the diversified economy of the state has not been as subject to labour fluctuations as in many other areas where one industry dominates the economy. The cost of living in Florida is generally below the national urban average, and in some areas, such as clothing, it is considerably below the average—another small but significant benefit accruing from the favourable climate.

Employment and living costs

Cultural life. Florida is well endowed with a variety of cultural activities and institutions, a situation stemming partly from the importance of tourism and partly from the increasing leisure time available to the growing number of retired residents. The state itself maintains more than 800 parks and other areas, many of historic or natural interest. The Everglades National Park contains 1,400,533 acres in the heart of a unique natural region. Florida's rich history is preserved in such places as St. Augustine, the nation's oldest town, portions of which have been restored, while its famous fort, Castillo de San Marcos, has been made a national monument.

Sarasota is a centre for both art and theatre. The John and Mable Ringling Museum of Art possesses an internationally famous collection, and the city also contains a circus museum and hall of fame and the only 18th-century Italian theatre in the United States—the Asolo. The Florida State Museum is located in Gainesville.

Among the numerous festivals that fill the cultural calendar are the Greek Orthodox Epiphany (Tarpon Springs; January), the Orange Bowl Festival (Miami; December–January), the Florida Citrus Festival (Winter Haven; February), the Strawberry Festival (Plant City; March), the Festival of States (St. Petersburg; March), the Arcadia Rodeo (Arcadia; March and July), and the Fiesta of Five Flags (Pensacola; June). The Gasparilla Pirate Invasion, a festival comparable to the Mardi Gras celebration in New Orleans, La., is held in Tampa in February, in association with the state fair.

Sports are well represented in Florida, with the Orange Bowl and Joe Robbie Stadium in Miami, the Gator Bowl in Jacksonville, and Tampa Stadium attracting major university and professional events. The National Basketball Association has teams in Miami and Orlando, and the National Football League is represented by teams in Tampa Bay and Miami. The Basque sport of jai alai enjoys great popularity in the state's urban areas. The mild climate allows Florida to host outdoor sporting events year-round. Many major-league baseball teams hold spring training in the state, and there are major golf tournaments, as well as internationally known auto races at Daytona Beach and Sebring. Horse racing is also important.

Commercial attractions proliferate in Florida, many of them educational as well as entertaining. Walt Disney

World, near Orlando, is the largest single tourist attraction in the country; the facility's Experimental Prototype Community of Tomorrow (EPCOT) is a permanent international showcase. Nearby Sea World conducts important marine research with sharks, porpoises, and whales, as does Marineland (near Daytona Beach) and the Seaquarium in Miami. At Busch Gardens in Tampa, visitors observe hundreds of African animals in an open environment.

In addition to other cultural offerings, Florida's universities and educational television stations provide broad programs in continuing and adult education. Several cities maintain symphony orchestras, and there are a number of major performing arts centres that host concerts, Broadway shows, and other events.

HISTORY

Exploration and settlement.   The early history of Europeans in Florida reflects the conflicts of the Spanish, French, and English crowns for empire and wealth. Juan Ponce de León's quest for the Fountain of Youth brought him to the peninsula in 1513 and 1521. Because he landed on the peninsula during the Easter season (Spanish: *Pascua florida* [season of flowers]), Ponce de León named the area Florida. Ponce de León made no attempt to found a settlement in 1513. In fact, he was under the impression that Florida was one of the islands in the Bahamas archipelago, and he does not seem to have ventured much north of present-day West Palm Beach. After an intermission of eight years, Ponce de León returned to establish a colony in the vicinity of modern Fort Myers. He was mortally wounded there in 1521 by the Calusa Indians and died the same year in Havana.

Spanish inroads and setbacks

In 1528 Pánfilo de Narváez landed on the shores of Tampa Bay with more than 400 men, with the intent of learning how this land was connected to Mexico. Within a year, and while still no closer to Mexico than northern Florida, the force was reduced to 15 survivors. Of this group, four Spaniards—including Álvar Núñez Cabeza de Vaca and Estebán, a Moorish slave who was the first black man known to enter Florida—reached Culiacán, Mexico, in 1536. Hernando de Soto came in 1539, landing somewhere between Fort Myers and Tampa, and led a devastating expedition through western Florida. Almost 20 years elapsed before Tristán de Luna y Arellano attempted to set up a colony at Pensacola Bay. It was abandoned in 1561, following devastation by a hurricane. In 1564 a group of French Protestants (Huguenots) who originally had been led by Jean Ribault established Fort Caroline on the banks of the River of May (St. Johns River), near modern Jacksonville. This group was seen by the Spaniards as a threat to their sea-lane from Havana to Spain. An expedition commanded by Pedro Menéndez de Avilés massacred most of the French colony in 1565 after founding St. Augustine nearby.

Shifting alliances and allegiances.   During the following centuries there were frequent raids by English seafarers, including Sir Francis Drake in 1586, and clashes with French colonizers along the northern coasts of the Gulf of Mexico and with English settlers in the Carolina and Georgia colonies. Shifting alliances among the three powers reflected the vicissitudes of European politics, and St. Augustine and the English ports of Savannah and Charleston to the north of Florida were besieged at various times throughout the first half of the 18th century.

England received Florida in return for Havana in 1763 and replaced the military government with civilian officials. Expenditures for economic development brought prosperity as well as loyalty from most Floridians during the U.S. War of Independence, when the area was used as a base for attacks on colonial coastal cities. Three decades of political and social instability followed Florida's return to Spain after the war, with U.S. expansionist interests in constant conflict with the Spanish presence. Pensacola was a base for the British during the War of 1812, when Indians and runaway slaves were employed to harass U.S. settlements. The First Seminole War (1817–18) was the beginning of armed conflict between the U.S. government and the Indians in Florida. General Andrew Jackson's capture of Pensacola led to the cession of Florida to the United States in a treaty signed in 1819 and ratified in 1821. But the following territorial years were difficult and included the Second Seminole War (1835–42), the most costly of the conflicts arising from Indian resistance to giving up their valuable land.

Statehood.   By 1845, when Florida was admitted as a state, all but a few hundred Seminoles had been removed to the territory of Oklahoma. The Third Seminole War (1855–58) was the final conflict with the Seminoles remaining in Florida.

Florida was a part of the Confederacy during the American Civil War, but action in the state was mostly limited to the capture of coastal cities by Union troops. In the 1880s an era of railroad building began that opened the state to permanent settlers and a new tourist trade and that brought it into the heart of the nation's economic life as the winter vegetable and citrus centre of the East.

Evolution of the contemporary state

The 20th century.   The growth of Florida in the 20th century had been frantic, if not chaotic. Land booms and the burgeoning population have paralleled economic diversification and Florida's increasingly international focus. The state became the nation's fourth most populous in the late 1980s, not only welcoming a flood of new residents from northern states and Canada but also accommodating hundreds of thousands of immigrants from the Caribbean area. Miami has become the economic "capital" of the Caribbean, a city where English is now virtually a second language. Floridians take most of these developments in stride, though the problems of rapid growth have resulted in pressure on the natural environment and have taxed the state's social resources. Ironically, the nation's oldest region of European settlement has once again become a frontier.   (R.H.Fu.)

Georgia

The largest of the U.S. states east of the Mississippi River and by many years the youngest of the 13 former English colonies, Georgia was founded in 1732, at which time its boundaries were even larger—including much of the present-day states of Alabama and Mississippi. Its landscape presents numerous contrasts, with more soil types than any other state as it sweeps from the Appalachian Mountains in the north (on the borders of Tennessee and North Carolina) to the marshes of the Atlantic coast on the southeast and the Okefenokee Swamp (which it shares with Florida) on the south. The Savannah and Chattahoochee rivers describe much of Georgia's eastern and western boundaries with South Carolina and Alabama, respectively.

Georgia has an area of 58,910 square miles (152,576 square kilometres). For most of the 19th century the state was the capital of the cotton empire of the South, but poultry products now account for many times the income from cotton. Although industry has far outstripped agriculture in economic importance, a high proportion of industrial workers remain in farm- or forestry-related jobs such as lumber products, food processing, and textile manufacture.

Atlanta, the capital, has long been the economic and cultural centre of the Southeast. Its name evokes the largely romantic legends of the pre-Civil War South, of the traditions of Southern gentility, and of white-columned mansions along Peachtree Street, its best-known thoroughfare. The history of the state is marked by events of the Civil War: the many major battles fought there, the Confederate prison at Andersonville, in which nearly 13,000 Union prisoners died, and the burning of Atlanta and the devastating March to the Sea by Union forces under General William Tecumseh Sherman.

The degree to which the wounds of this history have been healed in Georgia is most strikingly exemplified in modern Atlanta. Since the 1960s, black citizens have played an increasingly important role in the city's administration; the first black mayor was elected in 1973. During the same period, Atlanta has become a nationally oriented city, attracting major corporations as well as citizens from all parts of the United States.

PHYSICAL AND HUMAN GEOGRAPHY

The land. *Relief.* The southernmost portions of the Blue Ridge Mountains cover northeastern and north central Georgia. In the northwest a limestone valley-and-ridge area predominates above Rome and the Coosa River. The higher elevations extend southward about 75 miles (120 kilometres), with peaks such as Kennesaw and Stone mountains rising from the floor of the upper Piedmont. The highest point in the state, Brasstown Bald in the Blue Ridge, reaches to a height of 4,784 feet (1,458 metres) above sea level. Below the mountains the Piedmont extends to the fall line of the rivers—the east-to-west line of Augusta, Milledgeville, Macon, and Columbus. Along the fall region, which is nearly 100 miles wide, sandy hills form a narrow, irregular belt. Below these hills the rolling terrain of the coastal plain levels out to the flatlands near the coast, the "pine barrens" of the early days.

Drainage. About half the streams of the state flow into the Atlantic Ocean, and most of the rest travel through Alabama and Florida into the Gulf of Mexico. A few streams in northern Georgia flow into the Tennessee River and then via the Ohio and Mississippi into the Gulf. The river basins have not contributed significantly to the regional divisions, which have been defined more by elevations and soils. The inland waters of Georgia consist of some two dozen artificial lakes, about 70,000 small ponds created largely by the federal Soil Conservation Service, and natural lakes in the southwest near Florida. The larger lakes have fostered widespread water recreation.

Because of the region's bedrock foundation, Piedmont communities and industries must rely on surface runoff for their primary water supply. The Coastal Plain, underlain by alternating layers of sand, clay, and limestone, draws much of its needed water from underground aquifers. Increasing domestic and industrial use of underground water supplies in Savannah, St. Marys, and Brunswick threaten to allow brackish water to invade the aquifers serving these coastal cities.

Soils. From the coast to the fall line, sand and sandy loam predominate, gray near the coast and increasingly red with higher elevations. In the Piedmont and Appalachian regions these traits continue, with an increasing amount of clay in the soils. Land in northern Georgia is referred to as "red land" or "gray land." In the limestone valleys and uplands in the northwest, the soils are of loam, silt, and clay and may be brown as well as gray or red.

Climate. Maritime tropical air masses dominate the climate in summer, but in other seasons continental polar air masses are not uncommon. The average January temperature in Atlanta is 42° F (6° C); in August it is 79° F (26° C). Farther south, January temperatures average 10° F (6° C) higher, but in August the difference is only about 3° F (2° C). In northern Georgia rain usually averages from 50 to 60 inches (1,270 to 1,524 millimetres) annually. The east central areas are drier, with about 44 inches. Precipitation is more evenly distributed throughout the seasons in northern Georgia, whereas the southern and coastal areas have more summer rains. Snow seldom occurs outside the mountainous northern counties.

Plant and animal life. Because of its mountains-to-the-sea topography, Georgia has a wide range of natural vegetation. It ranges from maple and hemlock and birch and beech near Blairsville in the north to the cypress, tupelo, and red gum of the stream swamps below the fall line and to the marsh grass of the coast and islands. Throughout most of the Appalachians, chestnut, oak, and yellow poplar are dominant. Much of this area is national forest. The region that extends from the Tennessee border to the fall line has mostly oak and pine, with pines predominating in parts of the west. Below the fall line and outside the swamps, vast stands of pine—longleaf, loblolly, and slash—cover the landscape. Exploitation of these trees for pulpwood is a leading economic activity. Much of the land, which had at one time been cleared of trees for agriculture, has gone back to trees, scrub, and grasses.

Georgia's wildlife is profuse. There are alligators in the south; bear, with a hunting season in counties near the mountains and the Okefenokee Swamp; deer, with restricted hunting in most counties; grouse; opossum; quail; rabbit; raccoon; squirrel; sea turtles, with no hunting allowed; and turkey, with quite restricted hunting. In general, wildlife is in a period of transition. Deer have been seen in suburban counties and bears on golf courses near Atlanta, but solid stands of pine and unbroken pasture are not ideal for wildlife. There is extensive stocking of game birds and fish. The major fish of southern Georgia, except snook and bonefish, are in waters off the coast, and all major freshwater game fish of the United States are found in Georgia's streams and lakes. Some 50 species of plants and 20 species of animals are listed as endangered in the state.

Settlement patterns. Migrations and historical change have tended to blur the traditional regions of Georgia. In an earlier time the coastal mainland and the sea islands were distinct, being separated from the middle part of Georgia by the pine barrens of the lower coastal plain. Rice and sea island cotton were major crops of this area. There was usually a summer exodus of plantation families to the southern highlands and to the North: a Savannah family, for example, might well know more people in Boston, New York City, or Philadelphia than they did in Augusta, Macon, or Columbus. The coastal region and the sea islands of Georgia and South Carolina still support the unique culture of the Gullahs (also called Geechees), blacks who speak a creole language based on colonial English and various West African languages.

Early subsistence farmers, who were known as "crackers" (probably meaning boasters or liars), tilled the land in the thinly populated pine barrens just above the coastal area. There the soil is sandy and poorly drained, and the farms and plantations existed amid near-frontier conditions throughout much of the 19th century.

Beyond the pine barrens to the north and west, a prosperous cotton culture flourished for a period of more than a century. The classic period of cotton plantations and farms before the Civil War was brief in several counties. The white-columned houses generally were built in the county seats, or "courthouse towns," whereas the majority of the rural homes could be termed no more than substantial farmhouses. The mountainous area of northern Georgia was an area of small subsistence farms and few slaves.

Blacks were long identified with commercial agriculture, which produced rice and sea island cotton on the coast and upland cotton in middle Georgia. Some modern historians use the term Black Belt as a demographic description of middle Georgia, where slavery predominated, though its origin stemmed from the dark soils of Alabama.

Plantations were cultivated by supervised group labour before the Civil War. After the war a family-plot system, called sharecropping or tenant farming, replaced the larger labour groups and reduced immediate supervision. There were two basic arrangements in the sharecrop system with some variations: in middle Georgia the division-by-halves system gave the landowner control of the farm's management and the sale of the crops that were raised. The more independent landowner of northern Georgia, if he did not own a small farm himself, rented by thirds and fourths and had more control.

Rural Georgia was settled in a pattern of separate farms without unified communities. Area names suggested such centres, but these generally were derived from the names of creeks, mountains, and militia districts. Schools, churches, and stores often drew neighbours in different directions, producing a highly diffused community life. Urban settlements originally served political and commercial purposes as county seats and cotton markets. The fall line cities became railroad points, and later they and some courthouse towns in the upper Piedmont had cotton mills.

Elsewhere the country general store and small local cotton gins declined as the larger towns gradually absorbed the slight commerce and industry. Later, better roads enabled people to travel from these smaller locales to the larger towns and cities. Today shopping centres, neon-lighted restaurants, and service stations are scattered throughout both the rural and urban areas of the state.

The people. In 1752, the year Georgia came under direct rule of the British government, it had only about 3,000 inhabitants, most of them either English or black.

[margin notes: Surface features | Variety of natural life | Land divisions and town growth]

Salzburgers from Austria lived at New Ebenezer and Savannah, Scottish Highlanders at Darien, and New England Congregationalists at Sunbury and Midway. Settlement was concentrated on the coast and up the Savannah River to the Augusta area. Irish, German, and other massive immigrations into the United States during the 19th century affected Georgia little, and by 1910 only about 15,000 foreign-born whites resided in the state.

Patterns of migration

Georgia lost more people than it gained through migration in each decade from 1870 to 1960, but the total population increased steadily due to high birth rates. More whites than blacks left until 1910, generally moving to Southern states to the west; after 1910 the black exodus was greater, generally to the cities of the North. The boll weevil plague of the 1920s devastated the cotton economy and caused massive departures of both races. The white emigration loss almost stopped in the 1950s; thereafter there was a net migration gain of both races.

Mechanized and chemically controlled agriculture, along with abandonment of cultivated farmlands to pastures and pine forests, were major causes of black migrations. Perhaps as important, however, were blacks' hopes that elsewhere they would find fewer ingrained patterns of discrimination.

The economy. Georgia's rapid industrialization after 1940 caused a shift in the meaning of such words as "farm" and "industry," and "agribusiness" has become a term in wide use. More people work in industry than on farms, but a great majority of industrial jobs depend on farm or forest products. Income from poultry is regarded as farm income despite the fact that chickens are raised in factory-like structures; feed prices are quoted for 150-ton lots, and financing is done by complex base-and-incentive arrangements—all indicating an extensive and highly developed agribusiness.

More conventional industries, such as automobile assembly, exploit the nearness of Atlanta to southeastern markets. Several decades of prosperity have also increased commerce, and a large number of New York City stores have branch stores in Atlanta and other Georgia cities.

The federal government affects Georgia's economy through direct purchases from industry, but more through payrolls at the several major military installations in the state. It produces some hydroelectric power and regulates its sale, much of it to rural electric cooperatives.

The state government, on the other hand, functions in the economic sphere largely to promote further industrial development or financial investment in the state, which continues to rely to a large extent on outside money. Atlanta is the financial centre of the Southeast and the headquarters of the Sixth District of the Federal Reserve Bank. More than 60 percent of state revenue comes from taxes levied on sales, licenses, and personal and corporate incomes. Taxes on personal income account for more than one-third of all tax revenue. Local governments in Georgia rely mainly on general property and sales taxes.

Following the pattern in most Southern states, membership in labour unions in Georgia remains below the national average. Given the traditional regional antipathy toward unionization and Georgia's consistently lower-than-average unemployment rates, this condition appears unlikely to change in any significant degree in the future.

Quarrying and forestry

Resources. Georgia is one of the nation's major producers of building stone and crushed stone. Pickens county in northern Georgia has one of the richest marble deposits in the world. Kaolin is taken from vast pits in middle Georgia, and the state is the major producer in the United States. Phosphate deposits in the southern part of the state are largely unexploited, but this region's ample reserves of artesian well water are proving useful for agricultural irrigation.

Georgia's virgin timberlands have been cut over, but the state ranks first in the nation in number of acres of commercial forest. Taxation of the state's timber-growing lands is an internal political issue, with growth rates versus tax rates a crucial argument. Lumber, plywood, and paper are major products, but Georgia is especially known for its large production of naval stores from its pine forests.

Georgia lies to the south of the states that benefit from

Loading slash pine, to be used for pulpwood, near Fitzgerald in the Coastal Plain area of south central Georgia.
Larry Lefever from Grant Heilman

the many hydroelectric dams of the Tennessee Valley Authority, and waterpower contributes only about 6 percent of its electrical energy. Petroleum, natural gas, and butane pipelines come into the state from the Southwest. Coastal waters provide working grounds for a number of Georgia fishermen, with shrimp and crab being the main catches.

Industry. In terms of manufacturing employment, the most important of Georgia's industries are textiles and apparel, food processing, transportation equipment, electrical and electronic equipment, and paper and lumber. Cotton textile production has occupied a major sector of Georgia's economy since the late 19th century. The continuation of specialization in textiles is shown in the great number of rug and carpet mills in northern Georgia. The concentration of looming and weaving skills there make the state one of the major textile producers in the nation. Manufactured items include airplanes, automobiles, mobile homes, chemicals, and processed foods.

Agriculture. With the continuing consolidation of farms into fewer but larger units and the advent of a pervasive agribusiness, Georgia has followed nationwide trends in agriculture. Much of the poultry industry is conducted by large companies that parcel out their work to small farmers and supply them with modern poultry-raising facilities. Cattle and swine raising are important, especially in the southern part of the state. Cash receipts from livestock and livestock products exceed those from crops. Cotton is still one of the major crops, although its value is far below the peak reached in the early 20th century. Georgia is the leading state in peanut (groundnut) production and ranks high in tobacco. Corn (maize) and soybeans follow peanuts in value. Peaches have become especially identified with Georgia, and pecans and watermelons are grown nearly everywhere in the state.

Major crops

Transportation. Water transportation determined the location of Georgia's first cities. As early as 1790 William Longstreet of Augusta was experimenting with steam-powered craft on the Savannah River. By the late 1820s, river steamers were carrying large cargoes of cotton downstream from collecting warehouses at the fall line to Savannah and other export centres. The *Savannah,* equipped with auxiliary steam power, sailed from its namesake port to Liverpool in 1819 to become the first steamship to cross the Atlantic Ocean.

Navigation on 500 miles of inland waterways has been

revived, and a state port authority has created barge service at Augusta, Columbus, Bainbridge, Savannah, and Brunswick for the distribution of chemical, wood, and mineral products. Savannah is the leading port on the Southern Atlantic seaboard in terms of tonnage of cargo handled.

Milledgeville was briefly the centre of an emerging road system for the settled counties in eastern Georgia and for the old military and post road running through Indian territories to Alabama. Atlanta, originally called Terminus on the early railroad survey maps, had a near-optimum location for all but water transport, thus making it a hub of railroad transportation for the Southeast. With the advent of highways and then of air traffic, the city maintained its focal position. Three interstate highways intersect in downtown Atlanta.

More than a dozen cities in the state have commercial air service. Atlanta's Hartsfield International Airport is by some measures the world's busiest. A rapid transit system began operating in the Atlanta area in 1979.

Administration and social conditions. *Government.* In 1982 Georgia adopted its 10th constitution, a document characterized by a reduction in the number of local amendments. The structure of state government tends to sever governmental from political processes, thereby limiting the appointive powers of the governor. The executive branch nonetheless exercises considerable control over state agencies by virtue of its major role in shaping the state's annual budget. The governor is elected to a four-year term but is limited to serving two terms.

The Georgia General Assembly consists of the 56-member Senate and the 180-member House of Representatives and meets annually in 40-day sessions; districts in 1972 replaced counties as units of representation. Like all other areas of government in Georgia, the courts reflect a marked shift from an earlier day of highly politicized complexity to a more centralized and professionalized system. Probate courts, magistrate courts, and municipal courts function at the lowest level, with superior courts, state courts, and juvenile courts forming the next tier. The Court of Appeals and the Supreme Court form the capstone of the state judicial system.

Georgia has many levels of local government, including 159 counties, about 533 municipalities, and more than 385 special districts. Counties often perform municipal-type services. Independently and through multicounty cooperative districts, they operate forestry units, airports, hospitals, and libraries. Most counties are governed by an elected Board of Commissioners.

Georgia politics has been in flux since the 1960s. Voting patterns have changed, and distinctions among local, state, and national politics have increased. Republican or third-party candidates have carried the state in presidential elections since 1964, with the exception of 1976 and 1980, when Jimmy Carter, a Democrat who had been governor of Georgia in 1971–75, won the state's presidential vote. Local politics and the "courthouse rings" (local elites) remain almost universally Democratic; and Democrats, while remaining shy of identification with the more liberal national party, continue to win the state house offices. Republicans, however, have won seats in Congress.

The political idiom has changed as well. Explicit racial demagoguery is no longer in evidence. Campaigns are long, and, with only occasional captive audiences, gubernatorial candidates are forced to stump and shake hands with the voters in a way that was once unnecessary.

Black precincts in Atlanta and Macon that were 80 to 90 percent Republican in 1956 are now Democratic by that margin or more. Whites and blacks in rural and less-affluent urban areas may vote for candidates on racial issues, whereas rural elites and affluent suburbanites tend to vote for either party depending on the nature of the contest and the commitments of the candidates.

The Civil Rights movement in Georgia has been characterized by legal action, many nonviolent and a few violent confrontations, selective buying campaigns, voter registration, and education. The movement has touched life in rural Georgia only very little. In cities and in settings of high visibility—offices, airports, stores, restaurants, and schools—blacks occupy roles dramatically different from those of earlier decades.

Education. Public education in Georgia dates from the passage of a public school act in 1870. Since 1945 the ages for compulsory attendance have been from six to 15 years. Since 1964 state support of public schools has been for a period of nine months per year. The racial integration of public schools increased private-school enrollments dramatically. In 1985 the General Assembly passed the Quality Basic Education Act, which substantially revised the formula for allocating state funds to local school systems.

Public institutions of higher learning, under a unified Board of Regents, are headed by the University of Georgia (chartered 1785; opened 1801) in Athens; the Medical College of Georgia (chartered 1828; became part of the university system 1950) in Augusta; and the Georgia Institute of Technology (1885) and Georgia State University (1913), both located in Atlanta. Other state colleges and junior colleges are spread across the state so that 95 percent of the population is within 35 miles of a college or university. The four undergraduate colleges and the graduate and professional schools of Atlanta University Center, all located on a single campus, are at the forefront of black higher education in the United States.

Health and welfare. Georgia has a modern mental health program. Regional hospitals for evaluation, emergency, and short-term treatment have been established throughout the state to serve communities within a 50-mile radius. In addition, there are approximately 60 community health care centres for outpatient treatment. A number of general hospitals have been built through federal programs.

Georgia has imaginative programs in family and children's services. There are state and regional youth-development centres for persons under 17. The state aids colleges in training welfare workers, whose activities are supplemented by a widespread volunteer program.

Cultural life. Atlanta is the cultural centre of the Southeast. Its memorial arts centre includes the High Museum of Art and a school of the visual arts, with performing facilities for its symphony orchestra and a professional resident theatre, both of which have premiered new works. Atlanta also has cooperative galleries run by painters and sculptors, and an active group of filmmakers.

Elsewhere in the state there are regional ballet companies, and community theatres perform in more than 30 localities. In addition to instruction in theatre, dance, the visual arts, and music in many colleges, Georgia Institute of Technology has a school of architecture, and the University of Georgia has a school of environmental design. Dozens of public museums and college galleries exhibit art, and Clark Atlanta University has a notable Afro-American collection. In 1988 Atlanta hosted the first National Black Arts Festival.

Georgia is rich in traditional arts and crafts, especially in the mountainous north. The craft of tufted fabrics was a major factor in attracting the carpet industry that developed around Dalton. Other handicraft workers find sales opportunities through country fairs in Hiawassee and nearby Gatlinburg, Tenn., and at many other art festivals across the state. A mountain arts cooperative has a store in Tallulah Falls, and craft shops are attached to several art galleries. A bulletin of the state's agriculture department gives free advertising for crafts, and a quarterly publication describes many of the old craft techniques.

Traditional music is sung by folk groups on the sea islands and in the mountains. Country music conventions are held in northern Georgia—with some tension between purists and users of electronic equipment. In rural churches of the northwest, unaccompanied shape-note, or "fa-so-la," singing from the *Sacred Harp* songbook remains strong, and throughout the area many prayers and sermons are delivered in singsong.

Georgia has a wide range of outdoor recreational opportunities. The mountainous north is dominated by the Chattahoochee National Forest, which includes the Cohutta Wilderness Area. On the coast is Cumberland Island National Seashore, which comprises part of that large barrier island. Numerous other national wildlife areas

and refuges are found throughout the coastal zone. The unique character of Okefenokee Swamp is nurtured and preserved through the administration of the Okefenokee National Wildlife Refuge and Wilderness Area, as well as the Stephen C. Foster and Laura S. Walker State Park facilities found there. Georgia also maintains a system of state parks that offer a wide range of outdoor recreational experiences, from ocean surf bathing to mountain hiking and climbing.

Though generally conservative, the press in Georgia has supported the more liberal statewide candidates in recent decades. *The Atlanta Constitution* has been recognized as one of the nation's outstanding newspapers. The Henry W. Grady School of Journalism at the University of Georgia oversees competition for the George Foster Peabody Awards for Distinguished Achievement in Broadcasting.

HISTORY

Prehistoric period. The first inhabitants of what is now Georgia found their way into the area during the period from 10,000 to 8000 BC. A migratory hunting people equipped with finely worked flint projectile points, these so-called Paleo-Indians appear to have built small, seasonally occupied camps as they followed the movements of their large animal prey. Members of the culture that arose between 8000 and 1000 BC, known as Archaic, developed a more diversified food supply but continued the seasonal migration of their ancestors. Permanent or semipermanent village settlement in Georgia came with the emergence of the Woodland culture in the period 1000 BC to AD 900. Small, widely dispersed, permanently occupied villages were inhabited by the Woodland agriculturalists, who supplemented their harvests with a variety of wild foods. Georgia Woodland Indians left their most lasting mark in the form of large mounds built of thousands of basketfuls of clay and earth. Some mounds contained human burials and elaborately worked jewelry, pottery, and figurines. Other mounds did not contain burials but were built in the shape of animals. The best-known of these is the Rock Eagle in what is now Putnam county, a large complex of quartz rocks laid out in the shape of a bird.

The Mound Builders

Spanish exploration. By the time Hernando de Soto led the first European expedition into the area about 1540, the Mississippian culture, so called after the river valley in which it flourished, had established its influence across the Southeast, with the Creek and Cherokee groups predominating in what is now Georgia. De Soto found a population of master farmers whose large permanent villages were built around enormous earthen temple mounds resembling the flat-topped pyramids found in Central America. Their reliable and productive system of agriculture, based on corn, beans, squash, pumpkin, and tobacco, provided surpluses in most years. Directly or indirectly, the Spanish expedition was disastrous for the Indians. In addition to the hundreds they killed or enslaved, the explorers were ultimately responsible—through the diseases they introduced, such as measles, smallpox, and whooping cough—for the deaths of thousands and the final decline of Mississippian culture in Georgia.

In 1565 the Spanish, responding to a French attempt to settle on the southeastern coast, began their occupation of Florida. From the stronghold at St. Augustine, Spain began to exert an increasing influence on the Indians of Georgia. A line of Roman Catholic missions and associated military posts were established on the barrier islands along the Georgia coast. The lives and settlement patterns of the coastal Indians were profoundly changed as they were converted to Christianity and persuaded to adopt a sedentary life-style in compact villages. Known to the Spanish as Guale, the Georgia coastal zone remained under the mission-presidio system for a century. In the second half of the 17th century increasing pressures from the British in South Carolina eventually led to the withdrawal of the Spanish missions from Guale. As Spanish power waned and British power grew, the area of modern Georgia came to be known as the Debatable Land. The South Carolinians began to build an Indian trade monopoly in the area but were slow to attempt permanent settlement south of the Savannah River.

English settlement. A trust for establishing the colony of Georgia was granted a charter by George II (after whom the colony was named) in 1732, long after the large English migrations of the 17th century. The prime mover in obtaining the charter was the English soldier and philanthropist James Edward Oglethorpe, who sought to found a colony where the poor of England could get a new start. He and other trustees encouraged the settlers to produce wines, silks, and spices, and thus relieve England of a dependency on foreign sources. The colony also would serve as a bulwark against the Spanish and French to the south and west.

First English settlement

The first English settlement in Georgia was made at Savannah in 1733. Some colonists paid their way; the colony's trustees paid the expenses of others. Oglethorpe directed the affairs of the colony, primarily its military operations. Essential to the trustees' utopian plan was a tightly structured settlement system designed to create a population of yeoman farmers living in compact villages and towns and cultivating outlying garden and small farm tracts. Slavery was prohibited in order to avoid the growth of large plantations. Like most such schemes, the colony failed to live up to the trustees' vision. Their most notable success was the planning and construction of Savannah. Faced with unrest and emigration, the trustees surrendered all power in the colony to the British government in 1752, a year before their charter was to expire.

Revolution and growth. In a thrust of pre-Revolutionary inland migration, substantial settlement of Georgia began as a belt extending along the Savannah River that reached the lower Piedmont. Georgia's response to the revolutionary tensions was complex and resulted in veritable civil warfare between loyalists and patriots and a time of chaos for most Georgians. After the Revolution, settlement expanded rapidly, especially westward from Augusta into the future "cotton counties" of middle Georgia. Speculations in public lands acquired through the removal of the Creek and Cherokee Indians from the state paved the way for the development of a largely commercial agriculture, which soon became overwhelmingly dominated by cotton. The Indian removal provided a traumatic chapter in the state's history. The Creeks and Cherokee, two of the Five Civilized Tribes of the Southeast, were removed under force of arms by way of the Trail of Tears to federally owned lands in what is now Oklahoma.

The slavery controversy and the Civil War. By the mid-19th century, most white Georgians, like most Southerners, had come to view slavery as economically indispensable to their society. When the Civil War came, most white Southerners, slave owner or not, joined in the defense of their common heritage and culture. Georgia, with the greatest number of true plantations, had in many respects come to epitomize this culture.

The war involved Georgians at every level. Coastal attacks and sporadic raids into the state were a prelude to the attack on Atlanta in the late summer of 1864, when General William T. Sherman launched his March to the Sea. In mid-November Sherman initiated a plan to cut a 50-mile-wide swath across Georgia. Starting from Atlanta, the left wing moved along the route of the Georgia Railroad to Madison and Milledgeville, while the right wing went overland to the southeast, leaving a broad belt of almost total destruction.

Sherman's March to the Sea

The aftermath of the Civil War has been seen as a return to essentially frontier conditions in Georgia. Georgians no longer enjoyed mastery over their environment, and new modes of social and economic organization emerged in efforts to regain such mastery. Agriculture still appeared to hold Georgia's most promising future, but the relationship between land and labour was changed dramatically.

After some experimentation with various contractual arrangements for farm labour following emancipation, the system of sharecropping, or paying the owner for use of the land with some portion of the crop, became a generally accepted institution in Georgia and throughout the South. The system encouraged both the landowner and the sharecropper to strive for large harvests and thus often led to the land being "mined" of its fertility. Almost invariably, land and capital remained in white hands, while

labour remained largely, though not entirely, black. This entrenched pattern was not broken until the scourge of the boll weevil in the early 1920s ended the long reign of cotton.

The 20th century.   The Great Depression began a decade early in Georgia. The collapse of the cotton industry led to a New Deal program of agricultural diversification encouraged by both state and federal agencies. Peaches and peanuts made important contributions to the Georgia farm economy, and tobacco, livestock, dairying, and poultry and egg production got under way on a commercial scale. As World War II began, thousands of Georgians became involved in the war effort, and federal funds were directed toward military training facilities and defense industries located in the state.

The postwar years saw economic prosperity increase rapidly in Georgia. After 1950 more Georgians were employed in manufacturing than in agriculture. At the same time, efforts to end racial segregation began. After some initial opposition, integration of the state's colleges and universities was undertaken in the 1960s, and integration of public elementary and secondary schools followed.

Impatient with the slow pace of change, many black Georgians turned to social activism, most notably Atlanta-born Martin Luther King, Jr., whose advocacy of nonviolent struggle for racial equality brought him the Nobel Peace Prize in 1964. Increasing numbers of black voters led to the election of blacks to state and local offices, including the election in 1973 of Maynard Jackson as the first black mayor of Atlanta.

Georgia's advances in the spheres of politics, civil rights, and economic growth continued. The state received national recognition with the 1976 election of President Jimmy Carter, the first Georgian ever elected to that office.   (G. He./L.De V.)

Kentucky

The Commonwealth of Kentucky is a south central state of the United States. Long the home of various Indian tribes, Kentucky was settled by Daniel Boone and other frontiersmen in 1769. Its name probably derives from the Iroquois word for "prairie." By 1792, when it was admitted as the 15th state of the Union—the first west of the Appalachian Mountains—Kentucky had drawn nearly 75,000 settlers.

Location and size   Rivers define Kentucky's boundaries except on the south, where it shares a border with Tennessee along a nearly straight line of about 425 miles (685 kilometres), and on its mountainous southeastern border with Virginia. The Tug and Big Sandy rivers separate it from West Virginia on the east and northeast. From the point where the Big Sandy empties into the Ohio River, the crested northern boundary cuts an irregular line across the country, following the Ohio and meeting the states of Ohio, Indiana, and Illinois to the north. Where the Ohio flows into the Mississippi, the short western edge of the state is separated by the Mississippi from Missouri. These boundaries encompass the state's area of 40,410 square miles (104,660 square kilometres). The capital, Frankfort, lies between the two major cities, Louisville, which lies on the Ohio River, and Lexington.

Kentucky brings to mind images of coal mines, of the bourbon whiskey named for the county where it was developed and is still made, of white-suited colonels and their ladies sipping mint juleps on summertime verandas, of mountaineers and moonshiners, of horse breeding and the Kentucky Derby. Actually, Kentucky encompasses a curious mixture of poverty and wealth, ugliness and beauty, North and South. Several hundred lives have been lost in Kentucky's coal mines, and strip-mining has left countless hillsides to erode. Yet the seemingly endless landscape of white-railed horse pens and paddocks, characteristic of the rolling Bluegrass region around Lexington, symbolizes an unhurried and genteel way of life that looks more to Kentucky's ties with the pre-Civil War South than to its position in the industrial frenzy of the nation. By further contrast, northernmost Kentucky, with its predominantly German heritage and suburban pattern of development,

belongs to metropolitan Cincinnati, Ohio. Kentucky has always existed in the middle: as a state looking back and ahead, as a crossroads for westward expansion, and as a split personality during the Civil War. It was the birthplace both of Abraham Lincoln, 16th president of the United States, and of Jefferson Davis, president of the Confederate States during that strife.

PHYSICAL AND HUMAN GEOGRAPHY

The land.   *Relief.*   Parts of Kentucky lie within three major physiographic regions of the United States—Appalachian Highlands, the Interior Lowlands, and the Coastal Plain. Within the state, six smaller regions may be identified, based on the underlying rock structure: Mountain, Knobs, Bluegrass, Pennyrile (or Pennyroyal), Western Coalfield, and Purchase.

More than 10,000 square miles of the easternmost part of Kentucky lie in the Mountain region, a sloping plateau of the Cumberland and Pine mountain ranges. It is a scenic land of narrow valleys, steep pinnacles, and transverse ridges. The state reaches its highest point at Big Black Mountain, 4,145 feet (1,264 metres) in altitude. An area of deep gorges, natural rock arches, and small valley farms, eastern Kentucky is drained by three major rivers and their tributaries: the Big Sandy, Cumberland, and Kentucky rivers. Natural passages through these mazes of mountains are sometimes provided by winding gaps, such as historic Cumberland Gap, or water gaps, which include the picturesque Breaks of Sandy. The Cumberland River descends from the plateau in the 68-foot Cumberland Falls, renowned for its moonbow, the only known occurrence of this phenomenon in North America. The great eastern coalfields of Kentucky lie in the mountains and, though the region has been a major coal-producing area throughout the 20th century, there are billions of tons of coal still buried in the eastern hills.

Physical diversity

A long, narrow region shaped like an irregular horseshoe with both ends touching the Ohio River, the Knobs embraces the Bluegrass country on its inner side, the Mountain area on the east, and the Pennyrile on the west. Its landscape is one of cone-shaped or rounded hills and ancient escarpments. The weathered shale soil is not rich and is easily eroded, making it better adapted to forest growth than to cultivation. Canebrakes grew along some of the lower ground before European settlement and attracted large herds of buffalo and deer. A major portion of the Daniel Boone National Forest lies in the eastern Knobs.

There is a folk saying that when east Kentuckians die they want to go to Lexington, the capital of the Bluegrass. The Bluegrass lies at Kentucky's geographic and legendary heart. Its 8,000 square miles are encircled by the Knobs and the Ohio River. The region was named for the long-stemmed grass that flourishes there. The underlying limestones are rich in phosphates and have created pasturage for some of the world's most famous horse farms.

The 7,800-square-mile Pennyrile adjoins every other region except the Bluegrass. On the east it joins the mountains; to the north its irregular boundaries are the Knobs, the Ohio River, and the Western Coalfield; in the west it joins the Purchase; and on the south it is bounded by Tennessee. Its name derives from the local pronunciation of pennyroyal, a plant of the mint family that is abundant in the area. The Pennyrile encompasses wooded rocky hillsides, small stock farms, cliffs, and an area once known as the Barrens—a condition caused by the Indians' continuous burning off of forest cover to make grasslands for buffalo. Most notably, it is a region of caves. Abundant waters, both surface and underground, and the limestones deposited during the Early Carboniferous epoch of geologic history (more than 300,000,000 years ago), have combined to create the area known as the Land of Ten Thousand Sinks and such famous subterranean passages as Mammoth Cave. The vast underworld cavern includes three rivers and three lakes, and it covers more than 300 miles on five distinct levels. Its temperature remains constant at 54° F (12° C) throughout the year. Many other caves underlie the Pennyrile. Along its western edge, Kentucky Lake and Lake Barkley, impoundments of the Tennessee and Cumberland rivers, respectively, have iso-

Cave region

lated a wooded peninsula known as the Land Between the Lakes, which is managed as an educational and recreational park by the Tennessee Valley Authority (TVA).

Surrounded by the Pennyrile and the Ohio River and crossed by the Green River, the Western Coalfield's 4,680 square miles comprise less than half the area of the eastern coal beds and only a little more than half of that of the Bluegrass. The region has a number of coal deposits throughout its extent, however, and it is fertile on some of its rolling uplands and its bottomlands. Hence it is both a mining and farming area.

The Purchase, also called Jackson Purchase, encompasses only 2,569 square miles in the southwestern corner of the state. It is bounded on the west by the Mississippi River, on the north by the Ohio River, and on the east by the impounded Tennessee River. The region's southern border is the "sunken" westernmost section of the long boundary with Tennessee. Geologically, the Purchase is the northernmost extent of the Gulf Coastal Plain. Its name refers to its purchase in 1818 by virtue of a treaty with the Chickasaw, of which Andrew Jackson, later the seventh president of the United States, was one of the signers. The Purchase is the lowest topographic area of Kentucky, but it is not uniformly flat. Wide floodplains are broken by low hills that may have been sandbars in ancient oceans. Bluffs, swamps, and lagoons form part of the terrain, and soft rocks of the region erode rapidly, altering the landscape. The area is one of the most fertile sections of Kentucky and is widely known both for crops and for its fine stands of poplar, hickory, and oak.

Reelfoot Lake (18,000 acres), on the Kentucky–Tennessee border, was formed by a series of earthquakes that began in December 1811 and lasted until March 1912. They were the most powerful tremors in U.S. history, estimated to have been between 8.4 and 8.8 on the Richter scale. There were some 1,800 shocks and aftershocks, the strongest of which were felt as far away as Washington, D.C., and New York City. It was reported that the shocks were so strong that the Mississippi River flowed backward for a few hours, as the land beneath buckled and surged upward; huge islands disappeared, and the town of New Madrid, Mo., dropped 12 feet and was buried underwater. As the river overflowed, Reelfoot, a lake 14 miles long, was formed. The shocks were caused by an ancient 40-mile-wide rift in the Earth that runs for roughly 200 miles along the Mississippi River valley from Memphis into Missouri and Illinois, bordering on Kentucky much of the distance. The rift is known as the New Madrid Fault, and scientists have predicted that additional quakes in the area are a certainty.

Drainage. Apart from the Mississippi, the Ohio, and the Big Sandy, which form parts of Kentucky's boundaries, seven main rivers flow through the state: the Licking, Kentucky, Salt, Green, Tradewater, Cumberland, and Tennessee. The rivers, which drain into the Ohio, have been dammed to form large reservoirs; Kentucky Lake and Lake Barkley are connected by a canal. The Green River, the longest stream that lies entirely within the state, rises in the eastern Pennyrile and flows some 370 miles before emptying into the Ohio.

Soils. The landscape of Kentucky is as diverse as the life it supports, extending from the wrinkled outcroppings of early Paleozoic rocks to the 2,300-mile shoreline of Kentucky lakes. Rich alluvial deposits lie along the rivers, while the rest of the state's soil derives from the long and gradual breakdown and decay of underlying rock.

Climate. Kentucky enjoys a temperate climate, plentiful rainfall, and distinctive soils, which combine to create variety in vegetation, animal life, and landscape. The state's mean annual temperature is between 55° and 60° F (13° and 16° C). The growing season lasts from 176 to 197 days a year. Mean annual rainfall for the entire state is about 45 inches (1,140 millimetres), evenly distributed throughout the year. The greatest differences occur between the southern areas, which average as much as 48 inches annually, and the northeast, which may receive only 40 inches. Prevailing winds are from the south and southwest, although winter's chill frequently arrives on north and northwest winds.

Plant and animal life. Kentucky was part of the hardwood forest region covering the nation from the Allegheny Mountains to the western prairies. Three-fourths of the state was once covered with stands of yellow poplar, oak, chestnut, sycamore, and walnut. By the close of the 19th century, however, all but a fraction of these virgin forests had been felled. Trees, shrubs, and plants of many kinds still flourish in all parts of the state, ranging from the native hardwoods and pines on the eastern slopes to the picturesque bald cypresses in the western river marshes, and the maples, beeches, and magnolia found throughout the state. Rhododendron, laurel, dogwood, redbud, and trillium are prominent among the dozens of flowering plants that can be found in the Kentucky mountains.

Birds and mammals of Kentucky include those native to the Deep South as well as those of southern Canada. Of the numerous hoofed animals that once roamed Kentucky—bison, elk, moose, and deer—only deer remain. Wolves and panthers have likewise disappeared. Among the many small animals found in the state are rabbits, squirrels, foxes, raccoons, opossums, woodchucks, and—in the numerous caves—bats and rodents. The northwestern corner of Kentucky, where the Green River flows into the Ohio, lies along one of the world's great migratory bird routes. More than 200 species of birds frequent this area, while close to 300 species have been found in the state as a whole. The marshes of the southwestern Kentucky–Tennessee border provide breeding places for such waterfowl as the American egret, great blue heron, and double-crested cormorant. A few wild turkeys remain as a reminder of pioneer days. The swift mountain streams, wide rivers, and man-made lakes of Kentucky provide habitats for more than 100 species of fish. The muskellunge, the largest member of the pike family and commonly considered a Great Lakes fish, is found in the Barren and Green rivers.

Settlement patterns. From the beginning, Kentucky has been a strongly rural state of small towns and crossroads. Only Louisville and Lexington have large populations. Part of the urban population lives in small cities such as Lexington, Covington, Owensboro, Paducah, and Frankfort. Following World War II many of the younger people left rural counties for cities both within and outside the state, creating severe economic, educational, and cultural problems.

The pace of living for most Kentuckians remains more leisurely than in many other areas of the country. The popular image of the Bluegrass Kentuckian includes leisurely colonels and fast horses, cold mint juleps and a hot game-meat stew called burgoo, while the mountaineer Kentuckian might be idealized as a dulcimer-strumming weaver of old English rhymes and homespun wisdom. Each is rooted, to some degree, in fact, and, though Kentuckians are losing many of their distinctive traits, part of the colour and flavour of individualism remains.

The people. Early settlers of Kentucky, who were predominantly English and Scotch-Irish, came from North Carolina, Virginia, Maryland, and Pennsylvania. The migrations of Daniel Boone reflected those of many of his fellow countrymen. He moved from Pennsylvania, where he was born, down the Great Valley of Virginia into North Carolina, where he lived until he led new settlers through Cumberland Gap to Kentucky. The best agricultural land was in the Bluegrass region, and this was the first area to be settled. The eastern mountains were settled last. Despite the horrors of backwoods warfare during and following the Revolution, the migration into the Bluegrass country continued. In addition to the Cumberland Gap route, the Mississippi brought early French émigrés from New Orleans, particularly to the Louisville area, while during the mid-19th century the Ohio River carried many German settlers and other migrants, via Pittsburgh, from New England and the Middle Atlantic states. There was also a large black population in Kentucky, though the proportion decreased after 1833. Just prior to the Civil War, the Underground Railroad flourished in Kentucky to help transport escaped slaves to free soil, and there was considerable black emigration during and after the war. The state's black population, constituting some 7 percent

Rivers of the state

Birdlife

of the total, is concentrated in the larger urban areas and in the southwestern part of the Pennyrile.

Diversified economy

The economy. Kentucky's economy comprises a balance among manufacturing, agriculture, mining, tourism, services, and trade. All regions of the state do not share equally, however. The Bluegrass is an affluent region. The Pennyrile is likewise diversified and prosperous, but economic conditions in the two coal-producing regions fluctuate with the demand for coal. The Purchase relies extensively on agriculture, and periods of drought or depressed crop prices cause the region to suffer. Manufacturing is the greatest income producer for the state.

Resources. Vast reserves of bituminous coal have made Kentucky the nation's number-one coal producer. Reserves are expected to last more than 200 years at present production rates. Kentucky's numerous streams and reservoirs provide more than 1,300 miles of navigable waterways and ample fresh water for manufacturing and recreation. Soils of the Bluegrass, Pennyrile, Western Coalfield, and the Purchase are excellent for agriculture. Only in eastern Kentucky is there a lack of land suitable for farming. Eastern Kentucky and the eastern Pennyrile have large timber reserves, primarily hardwoods. The two coalfields and the Pennyrile have oil and natural gas deposits, although not in large quantities. Several small deposits of vein minerals are found along with a variety of clays and an abundance of limestone.

Agriculture, forestry, and fishing. Prior to 1950 Kentucky was considered an agricultural state. Since that time the number of farms and the acreage devoted to agriculture have declined, although average farm size has increased. Principal crops are tobacco, corn (maize), soybeans, and hay. The Bluegrass region, with the richest soil, is highly specialized in horses, cattle, and tobacco. The Pennyrile produces a variety of crops and livestock. The Western Coalfield and the Purchase specialize in corn, soybeans, and tobacco, although some livestock and smaller acreages of other crops are found. Forestry is important in eastern Kentucky and in the eastern part of the Pennyrile; the trees cut are mostly hardwoods. Kentucky has little commercial fishing, but its streams and reservoirs provide excellent opportunities for sport fishing.

Coal mining

Mining and industry. Coal is by far Kentucky's most important mineral. It is found throughout the two coalfield regions. Eastern Kentucky coal is of coking quality. That of the Western Coalfield is higher in sulfur content and is used primarily for steam generation of electricity and domestic use. Modern mining methods produce vast quantities of coal with few workers, and unemployment rates in the coalfields are high. Several large steam-generating plants in the Western Coalfield—the largest at Paradise—consume thousands of tons of coal daily.

Manufacturing, although widely dispersed, is concentrated in the urban areas. The Louisville area accounts for 25 percent of the state's plants and nearly one-third of all manufacturing employment. The metals-related industries have dominated the state's industrial growth in recent years. Textile plants, often located in smaller communities, account for approximately 10 percent of manufacturing employment. Calvert City, near the mouth of the Tennessee River, has a large concentration of chemical industries.

For many county seats in Kentucky, the trade and service industries are of primary importance, although nearly all have manufacturing plants. Kentucky has excellent tourist facilities, especially near the lakes and in the larger cities.

A strong labour union tradition exists in the Ohio River towns, and the United Mine Workers of America (UMWA) is influential in the coal region. Early struggles between the UMWA and coal operators in eastern Kentucky gave rise to tragic violence. The name of Bloody Harlan commemorates that county's labour wars during the 1920s and '30s, highlighting working and living conditions that became popularly identified with those of the state as a whole. Numerous ballads recount the history of conflict and death surrounding work in the coal mines.

Transportation. Interstate highways cross Kentucky from north to south and east to west. They are supplemented by a system of parkways, U.S. highways, and state highways that make travel by automobile or truck relatively easy almost everywhere in the state. Rail lines connect all major cities for movement of freight. Bulky freight is often shipped by river barge over Kentucky's many miles of navigable waterways. Three major airports—in Louisville, Lexington, and northern Kentucky—serve the central Kentucky area. The Greater Cincinnati airport in northern Kentucky provides international service. Several medium-sized cities have connector lines.

Administration and social conditions. *Government.* Under the constitution adopted in 1891, the state government comprises the executive, legislative, and judicial branches. The governor is elected for a four-year term and may not succeed himself. The General Assembly, which meets in even-numbered years, is bicameral, with a Senate and House of Representatives. The Senate has 38 members who serve for four years, and the House has 100 members who serve for two years. Tax bills must originate in the House. There are several levels in the state court system, ranging from local police courts to the seven-member Supreme Court. The judges of the Supreme Court, the Court of Appeals, and the circuit courts are elected for eight-year terms. District court judges are elected for four years.

Kentucky has 120 counties, each headed by a county judge who has substantial appointive powers and is responsible for preparing the budget and estimating receipts. The fiscal court serves as the administrative and policy-making body of each county. County officials are elected for four-year terms. Kentucky has no townships but has a system of magisterial districts. Municipalities are divided into six classes according to population. There are three forms of city government: the mayor–council plan, the commission plan, and the city-manager plan. The mayor–council plan, which provides for separation of executive and legislative powers, is most favoured.

Education. Kentucky's first school was founded at Fort Harrod in 1775. Education is free and compulsory between the ages of seven and 16. The average educational level is below the national average but has risen in recent years. State taxation for the support of education was first levied in 1904. Elementary, middle, and high schools have in most cases been consolidated at the county level and occupy modern facilities. Most of Kentucky's private schools are church-supported.

Higher education

Kentucky has a number of state-supported universities and private two- and four-year colleges, as well as vocational schools and state-supported community colleges. Transylvania University in Lexington, chartered in 1780, is the oldest institution of higher learning west of the Allegheny Mountains. The University of Kentucky, also in Lexington, is the state's largest university and has responsibility for the community colleges. The University of Louisville, founded by the city council in 1798, is the oldest public university in the state. It became part of the state university system in 1970. Berea College, founded in 1855 to serve needy students from Appalachia, has become a regional centre for traditional arts and crafts.

Health and welfare. The Department for Human Resources is the largest department in state government. It has numerous divisions, including preventive medicine, medical inspection and licensing, medical care for the needy, chronic disease control, sanitation in water supply and sewage, public assistance, and child-welfare programs. Lexington and Louisville each have general and specialized hospitals and a university with medical and dental schools. Most county seats have hospitals, but there is a shortage of medical and dental personnel in the more remote areas. There is a need for improvement in health care facilities in smaller towns and rural areas where doctors and dentists must usually practice corrective rather than preventive health measures. A unique feature of health care in Kentucky is the Frontier Nursing Service, founded in 1925, which provides general nursing and obstetric service in the isolated mountain area of eastern Kentucky. A variety of programs throughout the state provide care for the elderly and the handicapped.

Cultural life. Kentucky life-styles are a little more Southern than those of states north of the Ohio River, but

differences are minor and in most cases are the result of smaller populations and a more rural outlook rather than ethnic differences. The larger cities of the Bluegrass are centres for the arts and have a variety of museums, theatres, galleries, and musical groups. Several of Kentucky's universities and colleges are in the Bluegrass. Their orchestras, theatre groups, concerts, and lecture series add to the cultural opportunities. Lexington is the centre of the world of horse breeding, and horse shows and horse racing are well-known Bluegrass traditions. Northern Kentucky, although part of the Bluegrass, reflects the German heritage of metropolitan Cincinnati in its churches, restaurants, family names, and an annual Oktoberfest.

Folk arts

Kentucky continues to make a special contribution to the national culture with its folk arts, especially in the rural areas. Haunting ballads from Elizabethan days and mournful songs relating recent tragedies or desertions combine to create a distinctive musical life among mountain people. Crafts handed down through generations still produce handsome homespun cloth, hand-carved furniture, patchwork quilts, and sturdy pottery. Surrounded by a mechanized, standardized world, Kentucky folk songs and handicrafts preserve a link with earlier days. The annual Big Singing, held at Benton in western Kentucky each May for more than 100 years, celebrates the heritage of shape-note, or "fa-so-la," singing. Among the nationally recognized writers identified with Kentucky are Robert Penn Warren, Wendell Berry, and Bobbie Ann Mason.

Kentucky has one of the finest state park systems in the United States. Several of the parks in the system are resort parks with lodges, cottages, campgrounds, and a variety of recreational facilities. The state also has three national parks: Mammoth Cave, Cumberland Gap, and the Abraham Lincoln Birthplace National Historic Site. A state fair is held in Louisville in August of each year, and Kentucky's counties have annual fairs, festivals, and horse shows. Thoroughbred and harness racing is found at several locations, and the horse farms in the Bluegrass attract many visitors. The Kentucky Derby, held at Louisville's Churchill Downs on the first Saturday of each May since 1875, is the first leg of the Triple Crown of Thoroughbred racing. The Daniel Boone National Forest in eastern Kentucky and the Land Between the Lakes national recreation area in western Kentucky are popular attractions. Kentucky's climate is favourable for outdoor recreation during most of the year.

HISTORY

Exploration and settlement. Before the arrival of Europeans, the Kentucky region was a hunting ground and battlefield for such Indian tribes as the Shawnee from the north and the Cherokee from the south. Even earlier agricultural and hunting peoples left burial mounds and other traces. French and Spanish explorers must have seen Kentucky from the rivers of the Mississippi basin, and traders entered the region from the eastern colonies during the early 18th century. During the 1750s and '60s Indian resistance and rough terrain hindered successful exploration of the region. In 1769, however, Daniel Boone penetrated to the central plateau region, or Bluegrass country.

Settlement was rapid during the 1770s, though the prophecies of an angry Cherokee chieftain, Dragging-Canoe—that Boone and other whites would find Kentucky "a dark and bloody land"—were in large part fulfilled. British officers spurred the Indians during the Revolution, notably in raids on Boonesboro in 1777 and 1778 and at a bloody ambush at Blue Licks in 1782, and settlers encountered numerous other sieges, scalpings, and skirmishes. Following the war immigrants poured down the rivers and traveled the Wilderness Road from Cumberland Gap. The settlers founded towns and before long began to call for separation of the judicial district of Kentucky from Virginia. Statehood conventions at Danville in the 1780s were somewhat ruffled by the "Spanish Conspiracy" of James Wilkinson and others to ally the region with Spain, but they led ultimately to admission into the Union on June 1, 1792, and to the organization of state government, which took place in a Lexington tavern.

Indian raids and immigration

Statehood and crises. Events leading to a second state constitution in 1800 revealed an internal division that has continued to characterize Kentucky. Farmers, who floated their grain, hides, and other products on flatboats down the Mississippi to Spanish-held New Orleans, allied themselves with other antislavery forces to oppose slaveholders and businessmen. The federal Alien and Sedition Acts of 1798, passed in an attempt to control criticism of the government, were vigorously opposed. One of the leading spokesmen for the opposition was the young politician Henry Clay, who was to stamp his personality on the state and national scenes as the "great compromiser."

Kentucky took a lead in the War of 1812, much of which was fought in the adjacent Northwest Territory against combined British and Indian forces. Following the war a land boom, with attendant speculation and inflation, and the chartering of 40 independent banks that flooded the state with paper money led to financial disaster during the national economic panic of 1819. Fierce controversy over relief to debtors split Clay's Whigs and Andrew Jackson's Democrats. Signs of progress from 1820 to 1850, however, included the building of a canal at Louisville, the chartering of railroads, and increased manufacturing. The slavery question was uppermost, however, until the Civil War. The few large slaveholders were located mainly in the plantation agriculture of the Bluegrass and Pennyrile sections, but by 1833, when the legislature forbade importation of slaves for resale, the state was already one-quarter black. Until the Civil War, proslavery forces maintained an iron control of government and prevented any constitutional change that endangered their property.

Civil War and its aftermath. During the war Kentucky was a state divided. Officially, it had sought to avoid war by continuing Clay's tradition of compromise. Some 90,-000 soldiers fought for the Union armies and about 40,000 for the Confederacy, though after the war popular sentiment became strongly pro-South. Following the defeat of the Confederate general Braxton Bragg at Perryville, in 1862, the only action in the state consisted of widespread guerrilla warfare.

The opening of new rail lines into the eastern coal country and the introduction of a tobacco economy stirred the state in the last decades of the 19th century. The Ku Klux Klan evoked fears and hatred, and the freed blacks were given the vote and settled as tenant farmers or urban workers. Blacks, however, were not to become first-class citizens. Lexington and the Ohio River cities—Louisville, Owensboro, Paducah, and Covington—grew rapidly, and

Labour
strife

the state was intensely involved in the populist agrarian politics of the period. Warfare between tobacco growers and tobacco trusts brought on an era of barn burning and similar attempts to keep tobacco prices up.

Continued diversification marked the 20th century, though the Great Depression and strikes by the UMWA brought serious problems and open strife in many sectors. The state followed the national trends toward the loss of rural population to industrial centres, both inside and outside the state. In 1966 the devastations of strip-mining were partially ameliorated by a law requiring restoration and reforestation of the landscape.

In the early 1970s a nationwide energy shortage created a demand for more coal, and Kentucky's coalfields prospered for nearly a decade. As oil prices stabilized, however, the demand for coal diminished. Layoffs in the automotive industry reduced the demand for steel, which in turn reduced the demand for coking-quality coal. Environmental concerns added to costs of coal production and use. Coal operators, in attempts to reduce production costs, introduced modern machinery that reduced the need for manpower. Unemployment in the coalfields became a major concern. In the interior of eastern Kentucky, where there is little agriculture and manufacturing, the incomes of many families dropped below the poverty level.

Kentucky's farms, which had numbered 279,000 in 1935, numbered less than 100,000 by the late 1980s as a result of falling prices for agricultural products, increased mechanization, and periods of drought. Tobacco, Kentucky's greatest income-producing crop, was declared to be a health hazard, making the future for this crop uncertain. Expansion of industry and educational reform were priorities of Kentucky administrations in the 1980s, including that of the state's first woman governor, Martha Layne Collins, elected in 1984.   (W.D./W.A.Bl.)

Louisiana

With parts of its land lying farther south than any portion of the continental United States except for southern Texas and the Florida peninsula, and with New Orleans, its largest city, lying on roughly the same parallel as Cairo, New Delhi, and Shanghai, Louisiana owes much of its complex personality to its geographic position.

Admitted to the Union in 1812 as the 18th state, Louisiana commands a once strategically vital region where the waters of the great Mississippi–Missouri river system, draining the continental interior of North America, flow out into the warm, northward-curving crescent of the Gulf of Mexico. It is not surprising that seven flags have flown over its territories since 1682, when the explorer Robert Cavelier, Lord de La Salle, placed a wooden cross in the ground and claimed the territory in the name of France's Louis XIV. The consequent varieties of cultural heritage run like bright threads through many of the aspects—social, political, and artistic—of life in the state.

The subtropical climate of the state has provided the magnificent, brooding scenery of the coastal bayous, and the lush, dank vegetation of its shores conceals a wealth of oil. The fertile soil covering much of the terrain made Louisiana a rich agricultural area by 1860, with sugarcane and cotton plantations flourishing. A lumbering boom occurred at the turn of the 20th century, and Louisiana underwent rapid industrialization after World War II. Mineral output is great, and the state ranks among the nation's leaders in petroleum production.

Turbulent
heritage

But progress has not been without its tragic and turbulent aspects: bitter territorial disputes and violent internal struggles for political power impeded the social and economic development of the state and crippled many of its political institutions. The wealth of the plantations was accumulated through the extensive use of slaves, whose descendants comprise almost one-third of Louisiana's population and whose culture has contributed much to the social fabric of the state. Racism and racial conflict have marred the development of the state from the Civil War period, through Reconstruction and the ensuing reaction, marked by the activities of the Ku Klux Klan, down to the civil rights conflicts of the 1960s and beyond.

The state is delineated from its neighbours, Arkansas, Mississippi, and Texas, by four natural and three man-made boundaries. The 47,752 square miles (123,678 square kilometres) of Louisiana include more than 3,000 square miles of inland waters. The capital is Baton Rouge.

PHYSICAL AND HUMAN GEOGRAPHY

The land. *Relief.* Louisiana shares the general physiographic characteristics common to the Gulf Coast states of the southern United States, with the vital exception of the Mississippi River, which flows through the state and extends its delta far into the Gulf of Mexico. The changing course of this great North American river has created the huge Atchafalaya basin and has dumped tons of sediment along the coast. Despite this, it has been estimated that the beachless coastline of Louisiana is eroding at a rate of about 16 square miles per year because the system of levees, or embankments, constructed by the federal government to keep the Mississippi in a central channel, has left side channels open to erosion.

Three types of regions are found in Louisiana: lowlands, terraces, and hills. The lowlands consist of the coastal marshes and the Mississippi floodplain with its natural levees and moderate relief. The Red River valley has a low elevation relief but with many raft lakes, built up by impounding water from a number of log jams, and red soils in association with its alluvial plain. The terraces include much of the so-called Florida Parishes above and to the northeast of the Mississippi and the prairies of southwestern Louisiana. Upland hills are on either side of the Red River valley and in the northern portion of the Florida Parishes; the state's highest elevation, in northwestern Louisiana, is 535 feet (163 metres) above sea level.

Soils. The soils of Louisiana have been one of the state's priceless resources; nearly one-third of the total land area is covered by the rich alluvium deposited by the overflowing of its rivers and bayous. Muck and peat soils are found within the coastal marshes, while the bottoms hold rich alluvial soils: the lighter and coarser bottom soils of the Mississippi and Red river valleys and older alluvium and loessial, or windblown, soils. Within the uplands, or hills, there are more mature soils that are less fertile.

Climate. Louisiana's climate is subtropical, a natural result of its location on the Gulf of Mexico. As it also lies at the mouth of the vast Mississippi–Missouri river valley, halfway between the Atlantic and the Pacific oceans, the state is also affected by continental weather patterns. Hot, humid summers, tempered by frequent afternoon thunder showers, alternate with mild winters. Louisiana is subject to tropical storms, and the hurricane season extends for six months, from June through November. Average annual temperatures range from 64° F (18° C) in the extreme north of the state to 71° F (21° C) at the mouth of the Mississippi River. The highest monthly average is 82° F (28° C) in July, and the lowest is 50° F (10° C) in January. Summer averages do not extend above the low 80s F, and it is the humidity, rather than the heat, that is one of the more marked characteristics of the state's subtropical climate. The frost season begins between November 1 in northern Louisiana and December 14 in the extreme southeast. The average growing season ranges from 220 to 320 days and the average precipitation from almost 45 inches (1,143 millimetres) at Shreveport to more than 56 inches at New Orleans.

Sub-
tropical
character-
istics

Plant and animal life. Natural vegetation in Louisiana is found in three major divisions: the first consists of forest, upland pines and hardwoods, bottomland hardwoods, and bald cypress; the second of prairie, or dry grassland; and the third of marshland, or wet grassland. In the southern half of the state, along a zone running westward from Baton Rouge, the live oak with its characteristic drapings of Spanish moss predominates. The magnolia, whose blossom is the state flower, grows throughout the state.

Muskrats and other fur-bearing rodents, together with alligators, inhabit the marshes of southern Louisiana. There is a great variety of birds, but the once-frequent brown pelican (the state bird) and the wild turkey are endangered; the ivory-billed woodpecker is believed to be extinct. The gray squirrel, deer, and dove are plen-

tiful. Fish, shrimp, crayfish, crab, and oyster are a source
of food and of income in the coastal and swamp areas.

Settlement patterns. Northern Louisiana forms a natu-
ral region including the northeastern Louisiana Delta, the
Red River valley, and the northern Louisiana hills. South-
ern Louisiana, composed of the parish of Avoyelles and
all the parishes that lie beneath the 31st parallel, has three
major subregions: (1) the Florida Parishes, (2) southwest-
ern Louisiana, which contains many Anglo-Saxon Protes-
tants but also has an important French minority, and (3)
in between, a region variously known as the Cajun, or the
river and bayou country, or the sugar bowl.

The earliest settlements in the river and bayou parishes
were "line" villages, where farmsteads were built at the
riverfront of a long and narrow lot, with the stream serving
as a highway. The line village pattern contrasted with the
irregular pattern stemming from the ancient land division
system of metes and bounds used by the Anglo-Saxons
of the Florida Parishes. Where the natural levee was wide
enough, plantations were established. Before the Civil
War, people came to the uplands of northern Louisiana
from the Eastern states and settled in isolated farmsteads
among the pine woods. Southwestern Louisiana was de-
veloped after 1880, its prairies converted into rice fields.
Settlement there resembled a grid system of land division
found throughout the interior of the United States.

The people. If a diversity of landscapes and forms
of settlement characterizes the state, its peoples and its
cultures also represent many Louisianas. The earliest Eu-
ropean settlers were French or Spanish, and only later
were the Florida Parishes and the northern part of the
state settled by *les Américains.* Each area of settlement
preserved a cultural heritage strongly marked by adher-
ence to either the Roman Catholic or Protestant faith.
The Louisiana French, particularly the descendants of the
Acadians, came to dominate much of southern Louisiana;
many of those who have arrived to live among them have
been assimilated to the Cajun way of life. French is spoken
in many parishes, and throughout southern Louisiana one
may hear English spoken with a French accent. In addi-
tion, there are several cultural islands in both regions of
the state. These are made up of Italian, Spanish (Isleños),
Hungarian, German, and Dalmatian-Slavonian commu-
nities. There are also several racially mixed settlements.

Variety
of land
divisions

The peoples of Louisiana exhibit a greater variety than
those in other Deep South states not only because of the
patterns of historical settlement but also because of the
migration to and through New Orleans from Europe, Latin
America, and Cuba. The number of foreign-born residents
of Louisiana, however, has declined; now four-fifths of the
population is composed of native-born Louisianians. The
vast majority of foreign-born residents are found within
the urbanized parishes of the state, especially New Orleans.

From the earliest days of the state, blacks have played
an important role; and in the late 20th century they still
constituted almost a third of the population. Historically,
the black population was concentrated in areas containing
the plantations sustained by their labour. During the early
20th century a large out-migration occurred, supplemented
after World War II by a black migration to the state's
urban areas. Although Louisiana's black population has
been denied the traditional avenues leading to
social and economic power, their culture has nevertheless
contributed to the life and character of the state and of
New Orleans, Louisiana's major city.

The
black
contribu-
tion

Southern Louisiana contains about three-fourths of the
state's population, and almost one-third of the people in
Louisiana live in the three most populated parishes. A
predominantly urban population was achieved for the first
time in 1950.

The economy. Louisiana has shared the economic un-
derdevelopment afflicting Southern states. Prior to 1941
nearly one-third of the labour force was employed in the
primary industries, based on raw materials, while only
one-fifth worked in the secondary sectors of mining, build-
ing, and manufacturing. Such an imbalance depressed
personal income per capita, which, until 1930, was but
slightly more than half of the national figure.

World War II hastened the industrial growth of Louisiana
to the extent that the numbers of the labour force en-
gaged in manufacturing increased considerably. The most
important development has been the establishment of a
chemical industry, based on the oil, sulfur, salt, and water
that are found in the area. An investment boom occurred
from 1947 to 1957 when the first big move to offshore
petroleum production was made.

Resources. Petroleum resources are found in all areas
of the state, but the main oil fields have been developed
between Shreveport and Monroe and throughout most of
southern Louisiana. Drilling has been moved out into the
Gulf. Natural gas resources have also been utilized. In-
cluding offshore drilling in federal waters, Louisiana ranks
third nationally in the production of crude petroleum and
second in the production of natural gas. Oil in Louisiana
is often found in association with the more than 100
known salt domes, blisterlike intrusions in the bedrock,
and sulfur lies in the caprock overlying the salt. Louisiana
leads the nation in the production of salt and is one of the
major sulfur-producing states. The natural gas resources
of the state have been an important source of industrial
power, and the abundant mineral fuels that are available
have been used to develop electrical power. Conservation
efforts have capitalized on the resources of soil and cli-
mate, and there is, as a result, extensive "tree farming."
Louisiana also has a prime asset in its water resources.

Pipelines are used to carry crude oil to refineries or natu-
ral gas to provide energy for homes and industries in state
and distant markets. Many miles of electric power lines
crisscross the state.

Industry and agriculture. Chemical products, petro-
leum, and transportation equipment are the leading man-
ufactured items. Cotton is no longer king in the agricul-
tural domain: it was first in cash farm receipts in 1960,
but within 20 years soybeans had become the leading
agricultural product, with beef cattle ranked second. Other
farm products include rice, sugarcane, dairy products, and
poultry and eggs. The state has become much less depen-
dent upon farming.

The
decline of
cotton

Transportation. Louisiana's waterways have always
been an important means of transportation. The state's
4,800–7,500 miles (7,680–12,000 kilometres) of naviga-
ble waterways include the Intracoastal Waterway. It is
Louisiana's only east–west waterway and canal system

and runs some 310 miles from Mississippi Sound to the Sabine River. It is part of a larger waterway extending from the Caloosahatchee River in Florida to Brownsville, Texas. The port of New Orleans is ranked second in the nation in volume of seaborne freight, while Baton Rouge, farther up the Mississippi River at the head of deep-channel navigation, is important for shipping of petroleum and chemical products, including aluminum, and grain.

Railroads became common after the 1830s, initially as feeders to the steamboat traffic, with the Clinton and Port Hudson line being the first railroad in the state. Railroading reached its peak in the early 20th century in connection with a feverish lumbering boom, and there are nearly 3,000 miles of track still in use in Louisiana. The state also has several thousand miles of highway. Louisiana has some 180 airports, and New Orleans International Airport, a leading continental link, is a major point of connection with Latin America.

Administration and social conditions. *Government.* A state constitution that was adopted in 1921 was Louisiana's 10th in 108 years. It remained in force for more than 50 years, a period during which the state underwent more fundamental change than had occurred in all the preceding 109 years of statehood.

The earliest document (1812) secured the political power of the planters and business classes and gave great appointive powers to the governor; the antebellum documents of 1845 and 1852 extended the suffrage and made every government office elective. Representation, based on population, continued legislative domination by the planter masters. The constitution of 1861, which substituted the phrase "Confederate States" for "United States," and its successors of 1864 and 1868, the latter extending the suffrage to all males, black as well as white, may be called the Civil War documents. The constitution of 1879, marking the end of the Reconstruction period, restricted the action of the legislature and granted executive powers rivaling those of 1812, while the constitution of 1898 effectively disfranchised the black citizens of the state. The constitutions of 1913 and 1921 were written by delegates of conventions called to grapple with the problems of the 20th century: in many respects they failed, primarily because of the shadows of the past that hung over them. A new state constitution was established in 1974.

The governor of Louisiana remains the state's most powerful official, not only from the weight of tradition (and personal performance) but also because of the extent of patronage among the many executive agencies, boards, commissions, and offices filled by gubernatorial appointment. The governor is elected for a term of four years and is permitted to serve no more than two consecutive terms. Several additional state officials are elected; others are appointed. The Louisiana legislature has two houses: the Senate, with 39 members, and the House of Representatives, with 105 members. Legislators are elected for four-year terms. The 1974 constitution retained a 1956 amendment that requires a two-thirds vote by both houses on taxation measures in order to curb spending money by the governor.

Local self-government in Louisiana followed the Virginia system of county government. The parish (county), the municipality, and the special district are the units of local government. There are 64 parishes, with land areas that vary from the 199 square miles in Orleans parish to the 1,441 square miles in Cameron parish. The name of the elected parish governing board, "the police jury," is not found anywhere else.

There are about 300 incorporated municipalities in Louisiana, described as state units, which exercise narrowly construed powers. The charter of incorporation detailed by law outlines three classes of municipalities based upon population: city (5,000); town (1,000–4,999); and village (150–999). Special districts established by the legislature provide for the administration of new or expanding functions of local government.

A 1975 statute mandated an open primary system for the election of state officers. Under this system, all candidates appear on a single ballot. The candidate who receives more than 50 percent of the votes in the primary is elected

to office. If no candidate receives a majority of the vote, a runoff election is held between the two candidates who received the most votes. Previously, Democratic nomination was tantamount to victory. In the open primary, however, the division of the Democratic vote by multiple candidates practically assured a runoff position for a lone Republican candidate. In consequence, Louisiana in 1979 elected its first Republican governor since Reconstruction.

The highest court in the state is the Supreme Court. Its seven justices are popularly elected for 10-year terms. Judges in the Court of Appeals, the district courts, and most of the lesser courts are also popularly elected.

Louisiana's legal system differs from that of the other 49 states in that it is based not on common law but on civil law, which is code, or written, law. The state draws upon its colonial inheritance, whereby the adopted code was based upon the Code Napoléon of France and further influenced by Spanish laws, both of which had a common source in Roman law. The civil law consists of broad principles drafted by authorities in various fields of law. In Louisiana the law is enacted in the constitution, which vests in the legislature the authority to make law, whereas the functions of the courts are limited to the application of the law to given sets of facts. Courts are not bound by previous decisions. The law governs all personal and property rights and has been extended to civil and criminal procedures. [Code Napoléon]

Education.   The constitution of 1974 revamped administration of education by establishing five boards: (1) a state board of regents to oversee higher education, (2) three separate management boards for Louisiana State University, Southern University, and the other state colleges and universities, and (3) a policy board for elementary and secondary education. Public elementary and secondary education were, beginning in 1988, administered by an appointed superintendent.

Louisiana State University, which is both the land-grant and the arts and sciences university, is the keystone of higher education in the state, with campuses in Baton Rouge, Eunice, Shreveport, and Alexandria. Its former campus in New Orleans has become the University of New Orleans. Louisiana Tech University, in Ruston, and the University of Southwestern Louisiana, in Lafayette, are among the state's other universities, many of which grew from junior colleges in the 1930s and '40s. Southern University, in Baton Rouge, with campuses is Shreveport and New Orleans, is a large public black university, as is Grambling State University, in Grambling. Tulane University, in New Orleans, has long excelled as a private institution. The Roman Catholic schools Loyola and Xavier and the private black school Dillard are all in New Orleans.

Health and welfare.   The legislature has established programs to provide a system of economic security and social welfare for various categories of citizens, including persons 65 years of age and over. The state gives aid and welfare to mothers and children and provides aid to the disabled and to the needy blind. Various state departments provide some aspects of welfare aid, but by far the most important is the Department of Health and Human Resources. The department provides services to Louisiana citizens through a central office in New Orleans and local units in parishes. Penal and correctional institutions operated by the state are administered under the general authority of the Department of Public Safety and Corrections. The penal system has often suffered from an excess of political interference.

The so-called Charity Hospital system, supported and administered by the state, is fairly unusual among the 50 states. The system maintains several general hospitals, as well as hospitals for the mentally ill. The Charity Hospital of Louisiana in New Orleans received some public support after its founding in 1811 but has long since been funded by the state.

Cultural life.   The extensive power of the Roman Catholic church in southern Louisiana and the domination of Baptists in northern Louisiana and among the black population remain important influences on social and cultural life. New Orleans and many smaller communities have been able to support the arts and philanthropic

institutions. The Creoles (descendants of French or Spanish settlers) developed a distinctive architecture, art, and cuisine centred on New Orleans. Planters emulated the Creoles, and, thus, the people of the alluvial parishes of northern Louisiana are more cosmopolitan in outlook than are the people of the uplands.

In folk culture and the arts Louisiana more than holds its own. This is especially evident in the realm of music, whether it be in black folk songs, including the celebrated rural blues; the Cajun bands at fais-dodos, country dances held in southern Louisiana; the community hymn singings of northern Louisiana; the jazz that New Orleans migrants took to Chicago and elsewhere; or the renaissance in Dixieland music played by bands at New Orleans' Preservation Hall.

New Orleans supports an opera company and a symphony orchestra. It was a major cultural centre during the 19th century. Its French Quarter attracted such artists as John J. Audubon, the great wildlife painter, and George Catlin, noted for his portrayals of the American West, together with writers such as Walt Whitman, Sherwood Anderson, and William Faulkner. Since the 1930s other cities, notably Shreveport, Monroe, Baton Rouge, and Lafayette, have evolved their own museums and galleries, orchestras, choruses, and little theatres.

Tourism has developed as an important industry using the appeal of the antebellum past and the attraction of Creole cuisine, a blend of French, Spanish, black, and Indian dishes. A series of parades and balls culminating in Mardi Gras (Shrove Tuesday) has become a national attraction in New Orleans. There are many public parks and gardens, and the state is advertised as a sportsman's paradise for hunting and fishing.

The literate Creole culture provided the state with a long press tradition, the first newspaper, *Le Moniteur de la Louisiane,* appearing in 1794. Eight others were published in New Orleans at the turn of the 19th century, and the rural parishes likewise published their own papers. The leading newspapers are concentrated in the urban parishes.

HISTORY

Early settlement. At least 16,000 years before European exploration, Indians occupied the region that was to become Louisiana. At least seven archaeological sites have been excavated, notably the so-called Poverty Point sites (approximately 700 BC) and the Marksville site (AD 100 to 550). Most Louisiana Indians lived in hunting and gathering camps in the uplands and coastal prairies, though there were farming villages in the rich, low-lying areas known as bottoms. It is estimated that there were 15,000 Indians in the area when settlement by Europeans began during the 1700s. By 1980 only about one-fifth as many Indians remained. Their heritage is present in many place-names that lend colour to the state's map.

While the Spanish were the first Europeans to discover the area, it was the French who colonized it. Serious colonization by France began in 1702, when Pierre Le Moyne d'Iberville and his brother Jean-Baptiste Le Moyne de Bienville explored the area and struggled to found permanent colonies. The city of New Orleans was established by Bienville in 1718. Royal charters covering the area had been granted, first to Antoine Crozat, in 1712, and then, in 1717, to the Scottish businessman John Law, whose Company of the West failed in 1720. When Louisiana became a French crown colony in 1731, its population had grown from fewer than 1,000 to nearly 8,000, including slaves. In addition to the French settlers, many thousands of Germans arrived, settling on the river just above New Orleans on what became known as the German Coast. Colonization was increased during the 1760s with the arrival of the French-speaking Acadians, who had been expelled from Nova Scotia by the British.

In 1762 Louisiana and New Orleans were ceded to Spain by a secret treaty that was to establish nearly four decades of Spanish rule and influence in the area. In 1779 the Spanish wrested Baton Rouge from the British and took all West Florida, which then extended from the peninsula westward across the Gulf Coast to the Mississippi River. In 1800 the Spanish re-ceded Louisiana to France, and in

1803 the United States concluded the Louisiana Purchase.

The 19th century. Louisiana was subsequently divided into the Territory of Orleans, which consisted essentially of the state within its present boundaries, and the Territory of Louisiana, which included all the vast area drained by the Mississippi and Missouri rivers. In 1810 the Territory of Orleans consisted of 77,000 people, and statehood proposals were beginning to be heard. When, in 1812, the territory petitioned to enter the Union, the eastern region, now called the Florida Parishes—where the people had rebelled against the Spanish and established the Republic of West Florida—was included.

There was an economic boom during the 1830s, generated by slave labour toiling on the flourishing sugarcane and cotton plantations, and sets of natural cleavages emerged in the political affairs of the state as French-American, and later planter–farmer, interests clashed in the political process. While the yeoman farmer held the suffrage, representation rested in the hands of a plantation aristocracy that overcame one-man, one-vote principles by counting slaves in the determination of district units. Under this circumstance, and with the breakdown of the two-party system during the 1850s, sentiment in the state was divided on the issue of secession from the Union. The pro-secession group prevailed in the convention of 1861, even though later research would make it appear that a majority of the citizens wanted to stay in the Union.

Separation was short-lived in southern Louisiana, for by May 1, 1862, New Orleans was occupied by Union forces. Following the end of the war, Louisiana was readmitted into the Union in 1868, and a severe Reconstruction period began. Political conflict occurred between the federal Republicans who were located in New Orleans and the former Confederates from the rural parishes. After 1876 the Democrats contested with the Republicans as the freed black citizen, whose vote represented the balance of power in the state, became the pawn in the electoral struggle. A number of clashes occurred between the factions, the most noted of which was Sept. 14, 1874, in New Orleans, when the White League briefly wrested control of the city from the Republican police. In 1876 the Democrats claimed that General Francis T. Nicholls was elected governor, but the Republicans claimed that S.B. Packard had won. Their claims were intertwined with the choice of presidential electors for that year in the famous Hayes–Tilden dispute. The Republicans manipulated the state returning board and sent two sets of election returns to Congress, and the Democrats sent their returns. The electoral commission accepted the Republican electors, just as it did those in dispute from South Carolina, Florida, and Oregon. Both Nicholls and Packard took the oath as governor in January 1877 and set up rival governments, which continued until President Rutherford B. Hayes, elected as a part of a bargain, ordered the withdrawal of federal troops from the capital on April 20, 1877, and the white Democratic Party was left in control.

The plantation economy continued as the farmer class, white and black alike, was squeezed from farm ownership and forced into sharecropping or tenancy. Agrarian protests that emerged during the 1880s and '90s produced the People's (Populist) Party and what seemed at the time to be a chance to overthrow the state's planter–merchant–lawyer rule. By the early 20th century, however, Louisiana was under a restrictive rule, as the elite was able to defeat the reform movement of the farmers in the gubernatorial election of 1896 and to enact the constitution of 1898. As a result, nearly all blacks were legally denied the right to exercise the franchise, while many of Louisiana's whites lost the will to do so.

The 20th century. Extensive lumbering attracted large corporations to Louisiana for three decades following 1890, and the discovery of oil and gas reserves helped to increase industrial development. While these trends may have laid the foundations for the eventual development of the Louisiana economy, the political leadership of the state was not ready to take advantage of these developments in terms of increased tax revenues and services to the people. Louisiana, therefore, continued to be a backward, segregated, and primarily agrarian society.

Marginal notes:

Musical traditions

Initial colonization

The Civil War and its aftermath

Part of the rise of the demagogic and populist Huey P. Long to the governorship during the late 1920s may well be attributed to the seriously arrested socioeconomic development of the state. With the support of the rural areas and the emerging working class, Long substituted a realism for the romance perpetuated by the conservative leadership. Under his administration welfare benefits and educational services were extended, and bridges, roads, and hospitals were constructed, not on the pay-as-you-go basis of the past but through the floating of bonded indebtedness. Since the rise of Longism and its perpetuation under Huey's brother, Earl K. Long (elected governor in 1948 and 1956), no political administration has seen fit to turn back the series of public benefits financed by increased taxation.

Policies of Huey P. Long

During and after World War II Louisiana experienced further economic development, which was heavily committed to the petrochemical industry and increasingly concerned with offshore oil and gas drilling in the Gulf of Mexico. Since the 1960s a "second Reconstruction" brought about by U.S. Supreme Court decisions on school desegregation and voting rights for blacks has had important consequences. Conflict, focused on race and religion, broke the bridge the Longs had built between northern and southern Louisiana.

Governor John J. McKeithen, who took office in 1964, stayed the furor over racial integration by building a firm consensus on "law and order." He was reelected in 1968 after successfully sponsoring a "second-term" constitutional amendment. Governor Edwin W. Edwards (elected 1972, reelected 1976) reaped benefit from an improved social atmosphere and expanding economic conditions in what was then called "oil-rich Louisiana." Unable to seek a third consecutive term in 1980, Edwards won an unprecedented third election in 1984, following the administration of Republican David Treen. A combination of southern Louisiana Cajun and black electoral power set the pattern.

Louisiana's progress in meeting the challenge of building a racially integrated society is evidenced by the fact that the ratio of blacks to whites among registered voters is nearly equivalent to that in the population as a whole. The potential to extend rights and opportunities is in place. The relative underdevelopment of the state, however, continued to be apparent in questions of political corruption and in the economic depression created by the world oil glut, as the state government had become heavily dependent on oil severance taxes.   (P.H.H.)

Mississippi

Originally part of America's Old Southwest, Mississippi became the 20th state of the Union in 1817. Its name has long been identified with many of the characteristics attributed, correctly or incorrectly, to the Deep South. Since the 1960s the state has been engaged in efforts to alter the economic and social patterns of the past. Mississippi ranks 32nd among the states in area. Jackson is the state capital. The name is derived from an Indian word meaning "great waters" or "father of waters."

For decades an unusually large dependent population, a predominantly agricultural economy, and a prevailing resistance to change have kept Mississippi's per capita income low and created an inadequate standard of living for many families. At least half of all Mississippians live in rural areas—but not necessarily on farms—and the state continues to rank low in many economic indexes, including per capita income, which is well below the national average. In 1965 industrial income surpassed agricultural income for the first time in the state's history.

Throughout most of its 47,689 square miles (123,515 square kilometres)—from Tennessee on the north to Louisiana and the Gulf of Mexico on the south, from Alabama on the east to Louisiana and Arkansas on the west—much of Mississippi's soil is rich and deep, and its low-lying landscape is laced with many rivers. Almost inevitably it became an agricultural state. The long dominance of a rural, unhurried way of life has contributed much to the problems of present-day Mississippi, just as

it earlier helped to enhance the state. This way of life has also left a sense of history among some Mississippians, whose ancestors created a culture of gentility that is still evident in the many historic mansions located in such old towns as Columbus, Biloxi, Natchez, and Holly Springs.

PHYSICAL AND HUMAN GEOGRAPHY

The land. Mississippi is a low-lying state, its highest point reaching only 806 feet (246 metres) above sea level. Except for its hilly northeast corner, Mississippi lies entirely within the eastern Gulf Coastal Plain physiographic region. It has generally low topographic elevations and extensive tracts of marshy land. Its major soil areas encompass hills, plains, prairies, river lowlands, and pine woods.

Relief. In the northwest the great fertile crescent called the Delta is the old floodplain of the Yazoo and Mississippi rivers, comprising 4,000,000 acres (1,600,000 hectares) of black alluvial soil many feet deep. Once subject to disastrous floods, the land is now protected by levee and reservoir systems. Though the Delta was only sparsely settled in antebellum days, it has become a region of highly mechanized farming.

The Delta

East of the Delta looms a high wall of loess bluffs, marking the beginning of the highlands, or hills. A brown loam belt of varying width extends from Tennessee to Louisiana. Most of southern Mississippi lies in the high and rolling Piney Woods. Though settled early, the area did not prosper until the early 20th century, when the great virgin pine forests were exploited and heavily reduced. It has since become a prosperous area based on diverse forest industries, cattle, and some specialty farming.

The coastal area, sometimes called the Coastal Meadows, or Terrace, borders the Gulf of Mexico. The soil is sandy and not well suited to crops, but its location, climate, and industrialization have made the region important.

Along the northern edge of the Piney Woods lies the narrow Central Prairie, separated from the Black Prairie by a section of hills and woods. The two prairies, with fertile black soil that is excellent for many types of agriculture, were once the site of cotton plantations. East of the Black Prairie, in the extreme northeast, are the Tennessee Hills. Arching between Tennessee and Alabama, these hills form the only area in Mississippi in which the terrain and people are reminiscent of the southeastern mountains.

West of the Black Prairie another highland area, the Pontotoc Ridge, ranges south from the Tennessee border. This ridge, averaging 400 to 600 feet (120 to 180 metres) above sea level, is one of the state's most distinctive features. Its fertile, sandy loam is excellent for orchards. A low-lying region called Flatwoods skirts the western edges of the Pontotoc Ridge and the Black Prairie. Its heavy clay soils drain poorly, and the area has never developed a prosperous economy. The North Central Hills range through northern and central Mississippi and eastward to Alabama. Their red clay soil supports small farms. Before scientific farming methods were widely adopted, erosion ruined thousands of acres in these hills.

Pontotoc Ridge

Drainage. Mississippi has many rivers, creeks, bayous, and other drainage. The state's principal river systems include the Tombigbee, now joined with the Tennessee to form the Tennessee–Tombigbee Waterway, in the northeastern section; the Pascagoula in the southeast; the Pearl in the south central section; and the Mississippi and its tributaries, notably the Yazoo and the Big Black, in the west. These streams all empty into the Gulf, either directly or through the Mississippi and other rivers.

Climate. Mississippi's location endows it with a favourable climatic range. The growing season is long (virtually year-round on the coast), rainfall is abundant, and extreme temperatures are unusual. Summers are warm, with temperatures sometimes exceeding 95° F (35° C). Autumn's bright, crisp days have the least rain and are usually the most agreeable of the year. January temperatures average from 42° F (6° C) to 50° F (10° C). Snowfall is rare but does occur. Supplies of water are abundant, and rainfall is usually adequate for replacement. The state's annual average is more than 50 inches (1,270 millimetres), varying by region. The coastal area is subject to hurricanes from June to October.

Plant and animal life. The mild climate, long growing season, and abundant rainfall provide Mississippi with a remarkable variety of plant and animal life. Live oaks and palms vary the landscape of the southern counties, and fruit trees and hardwoods thrive in the north. The magnolia and pecan trees are favourites throughout the state. Pine forest, often intermixed with oaks, is found extensively on the state's sandier soils. More than half the land area is in forests, and both natural and cultivated floral displays are diverse and abundant.

Opening land to farming and hunting reduced the once abundant wildlife to near extinction. The wolf and puma (cougar) are gone; the bobcat is rare and the bear even rarer. Yet deer are once more abundant, and wild turkeys have increased. The state has a variety of resident and migratory birds. Some game fish can be taken throughout the year, with catfish, bream, bass, and perch the leading freshwater species. The Gulf is rich in shrimp, oysters, and fish, the mainstays of extensive commercial fishery.

Settlement patterns. Almost every Mississippian knows and uses such regional designations as the Delta and the Hills, South Mississippi and the Coast, the Prairie or the Black Belt, and North Mississippi and the Northeast. The landscape of Mississippi is mainly one of forests, fields, and towns. Cities and factories take a lesser place. Soils unsuited to row crops may support tree farms, pastures, or orchards. The largest metropolitan areas are Jackson, Biloxi–Gulfport, and Pascagoula.

Geographers may speak of the Yazoo basin, but to the people of Mississippi it is the Delta. The white Deltans pay homage to aristocratic plantation traditions and tend to be politically conservative. The Hill people, however, do not defer to the Deltans, many of whose families originally came from the Hills.

What historians call the Piney Woods, covering most of the state south of Jackson, the people call South Mississippi. Its population and prosperity have grown in the 20th century, and change seems to come easier there than in most other regions. Farmers are rapidly being replaced by workers in commerce and industry.

The coastal area is atypical of the state as a whole. More Roman Catholic and Mediterranean than upstate, it blends French, Spanish, Latin-American, Dalmatian, and British heritages in the most heterogeneous of Mississippi's regions.

The Prairie region has some of the ways and style of both the Delta and the Hills. Its lands, however, are more productive than the Hills, and some traditions from the antebellum era remain. Northeast Mississippi developed as an area of small family farms and few plantations, and it has the lowest nonwhite population in the state.

The people. The white population of Mississippi is remarkably homogeneous. More than 98 percent native-born of native stock, whites are predominantly of British, Irish, and northern European ancestry. The black, Choctaw Indian, and Chinese segments of the population are also almost entirely native-born.

Until about 1940 blacks were in the majority, but by the late 20th century, largely because of a very high rate of out-migration, blacks made up only a third of the population. A few thousand Indians (mostly Choctaw) live in the east central section of the state. The small Chinese population found in the Delta is descended from farm labourers brought there from California in the 1870s. The Chinese did not adjust well to the Mississippi plantation system, however, and most of them became small merchants. The coastal fishing industry has attracted Southeast Asian refugees.

Various Protestant denominations dominate Mississippi's religious life, most notably Baptists and United Methodists. The Roman Catholic population is mainly concentrated in the urban centres and the southernmost areas, especially the coastal counties. The Jewish community is almost entirely urban.

Mississippi has no great extremes of population concentration or extensive uninhabited areas. Since 1950 there has been a slow but steady loss of farm population and a decline of smaller towns, but most of the centres of more than 10,000 inhabitants have had significant growth.

Mississippians, who inherited the frontier tradition of "moving on," have become as mobile as other Americans. Frequent movement by sharecroppers and tenant farmers from one farmstead to another was commonplace before 1920, at about which time the economic focus (and the locus of emigration) shifted to the cities and towns. About three-fourths of the white emigrants moved to other Southern states, whereas the same proportion of black emigrants left the South entirely. The net loss by emigration has largely offset Mississippi's high rate of natural increase. Significant population growth in Mississippi would require that the state retain more of its young people.

The economy. In many economic indexes Mississippi ranks low in its region and in the nation. There has been some improvement in employment, wages, and personal income; but the proportionate national and regional growth has been even greater, and the relative economic disadvantage continues. Nearly 95 percent of personal income is derived from eight sources—manufacturing, the federal government, property, farms, state and local governments, wholesale and retail trade, operation of nonfarm commercial enterprises, and personal and business services.

State agencies administer regulatory functions in the area of utilities, transportation, oil, gas, insurance, and pollution. The Department of Economic Development seeks new businesses and aids in expanding existing ones by such means as loans for training and recruiting workers. It is aided by the Mississippi Research and Development Center through research in economic development. The several economic-development districts promote activities in their constituent counties. The private sector also advertises the state's advantages.

Labour union membership is relatively small, although widely dispersed. Most large employers have a union membership, though Mississippi has a right-to-work law that prohibits compulsory union membership.

Resources. Petroleum and natural gas account for more than nine-tenths of the value of all minerals produced. Important nonmetallic minerals include sand and gravel, fuller's earth, and other clays. Iron has been mined intermittently since 1887. Aluminum ores are low in quality, and they have been little exploited.

About half of the land area is in commercial forests that produce lumber, paper pulp, naval stores, and other forest products. Seafoods from Gulf waters are processed in coastal plants.

Electrical power produced within the state is from steam-generating plants and a nuclear power station near Port Gibson. Hydroelectric power is brought into Mississippi from Tennessee Valley Authority dams and through interconnections with power companies in other states. A few private companies, numerous rural cooperatives, and several municipal generating systems are in operation. Several large transmission facilities bring natural gas into and through the state.

Agriculture. Since World War II Mississippi's economy has become less dependent on agriculture, and both the number of farms and farm acreage have declined. Cotton is no longer king in Mississippi. The state's principal agricultural income derives from livestock, catfish farms, and poultry and from various crops, with soybeans and cotton being the most prevalent. Approximately 70 percent of the state's farms produce livestock and dairy products, while only about 10 percent of the farms produce cotton.

Industry. In 1936 Mississippi began a program to promote the expansion of manufacturing, and in 1965 the state's industrial employment exceeded the number of agricultural workers for the first time. The state's major manufactured goods include forest and chemical products. The Ingalls Shipyard, at Pascagoula, is the state's largest employer.

Transportation. The declining fortunes of rail transportation and the existence of obsolete segments of the state's highway system have created problems in transportation. The heaviest volume of traffic is along the Gulf Coast, where it merges into the flow from the numerous upstate north–south and east–west patterns. The 200-mile Natchez Trace Parkway, which extends from Natchez to

Margin notes:

Regional distinctions

Patterns of migration

Labour union membership

Nashville, Tenn., and is part of the National Park Service, is protected from commercialization and truck traffic. Peaceful and sylvan, it preserves the natural surroundings of the old Indian trace, or trail, and encompasses many sites of historic interest.

Commercial transportation, in addition to highway trucking, is diversified. Of the railways in the state, half are entirely intrastate. Most large cities have commercial airports with scheduled air service. Interstate bus lines serve almost all major cities and towns. Gulfport and Pascagoula can accommodate oceangoing ships, and low-draft oceangoing vessels can travel up the Mississippi to Natchez, Vicksburg, and Greenville. Barge traffic moves on the Mississippi, Pearl, and Yazoo rivers. The Gulf Intracoastal Waterway passes just off the coast across the Mississippi Sound.

Administration and social conditions. *Government.* The state government has executive, legislative, and judicial branches, but it differs from those of some states in that most heads of executive departments are elected rather than appointed. The bicameral legislature, which meets in annual sessions, comprises a 122-member House of Representatives and a 52-member Senate. Members of both houses are elected to four-year terms.

The executive branch of state government includes the governor, lieutenant governor, and eleven other officials, all of whom are elected to four-year terms. Executive officials can succeed themselves.

The lowest court in the state's judicial system is the justice court, which has original jurisdiction in misdemeanors for which fines, sentences, and judgments do not exceed prescribed limits. Some large counties also maintain a county court. Chancery courts have jurisdiction over matters of equity, probate, juvenile delinquency (where county courts do not exist), divorce, and mental competence. Circuit courts are the main trial courts for major suits, criminal cases, and appeals from justice and county courts. The Supreme Court is the court of appeal; its nine justices are elected, from three judicial districts, for staggered terms of eight years. All other judges are elected to four-year terms.

Each of Mississippi's 82 counties is governed by a board of supervisors. Municipalities may be incorporated as villages, towns, or cities. Governments of these units are of the mayor–council type with aldermen, the commission type with three commissioners (including the mayor), or the city-manager type, in which the manager is appointed by the council. State and county officials are elected in a November general election. Party primaries are held in August.

From the end of Reconstruction until the late 1940s, the Democratic Party was essentially the only party in Mississippi. As in many Southern states, literacy tests, poll taxes, and other restrictive measures kept blacks at a proportionally low level of political involvement. Disaffection among Mississippi's white voters with the national Democratic Party broke its domination in 1948, and thereafter, with few exceptions, states' rights or conservative Republican presidential candidates received the state's electoral ballots. Increasing participation by blacks, made possible by the federal Civil Rights Act of 1964 and the Voting Rights Act a year later, further redefined party politics in Mississippi. For a time, two Democratic parties existed—a predominantly black Loyalist faction allied with the more liberal national party, and a conservative wing favouring the traditional state power structure. The party eventually unified, with the Republican opposition gaining support among conservative Mississippians. Since the 1960s blacks have won election to an increasing number of local and state offices throughout Mississippi.

Finances. Sales taxes are the state's major source of revenue, followed by personal and corporate income taxes and gasoline taxes. Local governments derive their greatest income from property taxes. Considerable amounts of federal monies are provided through numerous federal and state agencies.

Education. Mississippi's public school system has been ranked at the bottom of almost all measurable standards for many years. Following years of turmoil brought on by the Supreme Court's 1954 ruling against segregation in public schools, the state committed itself to a dramatic

(margin labels:) Race and politics

improvement of its schools. The Education Reform Act of 1982, the reinstatement of compulsory attendance for children between the ages of six and 14, competency testing of high school students, the creation of an appointed state school board, and the establishment of an early childhood education program are measures that the state has taken to enhance the quality of education. The success of these measures is evident in the diminishing school dropout rate and the steady improvement in educational test scores.

Mississippi has a distinguished history of higher education, however. Although it closed in 1826 and again in 1863, Jefferson College, founded in 1802, was among the earliest public institutions of higher learning in the nation. Elizabeth Female Academy, which is sometimes considered to be the first women's college, was established at Washington in 1818. In 1878 Mississippi established Alcorn Agricultural and Mechanical College (now Alcorn State University), the first land-grant college for blacks in the United States, and in 1884 it established the Industrial Institute and College (now the Mississippi University for Women), the first state-supported institution granting diplomas to women. The University of Mississippi, in University, near Oxford, was chartered in 1844 and opened in 1848. In addition to the more than 40 junior colleges, colleges, and universities, other educational facilities include a medical centre, the Gulf Coast Marine Research Laboratory, and the Mississippi Sea Grant Consortium.

(margin label:) Higher education

Health and welfare. Education, health, welfare, and other measurements of the quality of life in Mississippi necessarily must be considered in the perspective of the state's long history of segregation and racial discrimination. The high infant mortality and illiteracy rates, low educational achievement scores, and welfare dependency are linked to a century of poverty, injustice, discrimination, and a resistance to modernization that has impeded the development of the state's natural and human resources. Almost all counties have some form of relief or welfare programs that involve federal funds. Welfare services include aid to the blind and disabled, the elderly, and dependent children. Health programs are administered by several state agencies, including the Board of Health, which dates from 1877.

Historically, the state has been in the vanguard of public health services. The causes of pellagra were discovered in 1915 through experiments at the state penal farm. A model mosquito-control program eradicated yellow fever, and the state tuberculosis sanitarium became recognized nationally. Pioneer work has continued in Mississippi in the education of blind and deaf children.

Cultural life. Before the Civil War the "Planter Society" and those who identified with it had a highly developed sense of gentility. The life-style to which they aspired made patronage of the arts obligatory. They built Greek Revival mansions and furnished them with art objects and fine furniture, their children were tutored in the social graces and the arts, and hospitality became an art in itself. The rural gentry, however, was only a very small part of the total society. The small landowner and slave alike fashioned simple, sturdy furniture, made their own oxbows and spinning wheels, and patiently crafted musical instruments. When they rested, they heard folk songs, ballads, or African lullabies. Their literature was myth, legend, and tall tale, and their dances were traditional or improvised.

From these sources came the present-day cultural and artistic heritage of Mississippians. In the 20th century, technology, mobility, and mass communication have created an adherence to a national culture. A freshening sense of history is evident, however, in the efforts to preserve historic landmarks and in the intensity of the collectors of the artifacts and furnishings of the past—of folk songs, implements and utensils, furniture, and manuscripts.

Mississippi has been a vital part of the flowering of Southern literature during the 20th century. The mythical county of Yoknapatawpha and the generations of its people were created by William Faulkner in a celebrated series of novels. The works of this Nobel Prize-winning Mississippian are often ranked among the highest attainments in American literature. Other natives of international literary renown include novelists Eudora Welty and

(margin label:) Mississippi writers

Richard Wright, novelist-critic Stark Young, and playwright Tennessee Williams. Mississippi's "second generation" of writers includes Elizabeth Spencer, Walker Percy, Willie Morris, and Ellen Douglas; more recently, Barry Hannah, Richard Ford, and Pulitzer Prize-winning playwright Beth Henley have attained national prominence.

Mississippi has produced several famous newspaper editors, including Turner Catledge, of the *New York Times,* and the Pulitzer Prize winner Hodding Carter, of the Greenville *Delta Democrat-Times.* All of the state's large towns are served by local dailies, and the smaller towns and communities are served by one of the strongest systems of weeklies in the United States.

News-
papers

In music, both white and black folk traditions are found, in English and Scottish ballads and in blues, spirituals, and sacred harp singing. This rich heritage has given rise to such acclaimed performers as Elvis Presley, blues artist B.B. King, and lyric soprano Leontyne Price. The state has several symphony orchestras, an opera guild in Jackson, and extensive musical activities at several colleges. The theatrical tradition dates from 1800, when a Natchez audience saw the first dramatic production to be presented west of the Alleghenies. Today some 20 community theatres and 30 colleges and universities offer dramatic fare, in addition to a semiprofessional company in Jackson.

Mississippi's rural heritage continues to be a strong influence on the life-styles and recreational habits of the people. Hunting, fishing, boating, camping, and other outdoor activities are among the most popular forms of leisure in the state. Mississippi maintains a system of state parks, and the U.S. Department of the Interior maintains the Vicksburg National Military Park and the Natchez Trace Parkway. The Natchez Pilgrimage is the best known of several festivals featuring antebellum homes and gardens.

HISTORY

The Indians. The Indians of Mississippi lived in harmony with the environment of the Southern woodlands and took great care to maintain the ecological balance they found in nature. Early European travelers often spoke of the Indians' love for the land and their bravery in defending it.

The Choctaw tribe, which numbered approximately 20,000 and was located primarily in the southern and central part of the state, was the largest of the three major tribes that lived in present-day Mississippi. The other two tribes

Longwood, antebellum mansion in Natchez, Miss.

were the Natchez, which numbered about 4,500 and were centred in southwestern Mississippi, and the Chickasaw, which had a population of about 5,000 and ranged from their principal villages in the northeastern part of the state into Tennessee and Kentucky. The Natchez were virtually exterminated during a war with the French garrison at Fort Rosalie (the present city of Natchez) in 1729–31. The Choctaw and Chickasaw were eventually removed from Mississippi to the Oklahoma territory in the 1830s.

Exploration and settlement. In the winter of 1540 Hernando de Soto led a large expedition into Mississippi and wintered along the Pontotoc River. In the following spring he reached the Mississippi River, but, because he found no gold or silver in the region, Spanish explorers directed their efforts elsewhere.

Nearly 130 years later a small group of French Canadians sailed down the Mississippi River and immediately realized its commercial and strategic importance. In 1699 a French expedition led by Pierre le Moyne d'Iberville established France's claim to the lower Mississippi valley. French settlements were soon established at Fort Maurepas, Mobile, Biloxi, Fort Rosalie, and New Orleans.

Following the French and Indian War, which ended in 1763, France ceded its possessions in the lower Mississippi valley, except New Orleans, to Great Britain, which also gained possession of Spanish Florida and divided that territory into two colonies. One of those was West Florida, which included the area between the Apalachicola and Mississippi rivers. The original northern boundary of West Florida was the 31° parallel, but it was extended in 1764 to the 32°28′ parallel. Fort Rosalie was renamed Fort Panmure, and the Natchez District was established as a subdivision of West Florida. Natchez flourished during the early 1770s. After the outbreak of the U.S. War of Independence, Spain regained possession of Florida and occupied Natchez. The Treaty of Paris of 1783 fixed the 31° parallel as the boundary between Spanish Florida and the United States, but Spain continued to occupy Natchez until the dispute was settled in 1798.

The
Natchez
District

Statehood and Civil War. The original Mississippi Territory created by the U.S. Congress in 1798 was a strip of land extending about 100 miles north to south and from the Mississippi River to the Chattahoochee on the Georgia border. The territory was increased in 1804 and 1812 to reach from Tennessee to the Gulf. In 1817 the western part achieved statehood (the eastern part became the state of Alabama in 1819). Natchez, the first territorial capital, was replaced in 1802 by nearby Washington, which in turn was replaced by Jackson in 1822.

The 1820s and '30s were marked by the decline of the Jeffersonian Republicans, the ascendancy of the Jacksonian Democrats, and the removal of the Indians to Oklahoma. They were the days of steamboats, land speculation, and the growth of a plantation-based cotton economy, with its concomitant slave population. Slave owning, however, was not common among the small landowners, who became more numerous than the large planters but who had little influence on public affairs for many years.

Sectionalism in both North and South had been growing for some time. Its ill feelings gradually became dominated in both North and South by slavery. In January 1861, a convention adopted an ordinance of secession, and within a year the state was in the midst of war. The people suffered much privation, and the land underwent great devastation; by 1865 the state was in economic ruin.

The aftermath. For 25 years following the Civil War, Mississippi's former slaves and their former owners grappled with the political, social, and economic consequences of emancipation. The white minority could not or would not accept a biracial society based on equality of opportunity. In 1890 the ruling elite adopted a constitution that established a caste system of racial segregation and an economic order that kept blacks in a position of dependency.

Mississippians hoped to find economic salvation in the coming of industry and the railroads, but the hope was only partially realized. Emancipation had made the former slaves free to go where they wished, but most remained and eventually were absorbed into the tenant-farming system. The continued economic interdependence of the two races

kept intact many of the customs and social systems that had developed before the war. The constitution of 1890 effectively disfranchised most of the black population.

World War I hastened the end of Mississippi's physical and psychological isolation, and most of the bitterness remaining from the Civil War was lost in a surge of patriotism. Between the wars the state was affected by the agricultural depression of the 1920s, the devastating 1927 flood, the Great Depression of the 1930s, the coming of farm-production controls, and the beginnings of new industrialization. After World War II government farm programs and mechanization on a broad scale created another agricultural revolution.

The Civil Rights movement. After World War II a series of events developed that may be characterized as a revolution in race relations. Many long-accepted practices, customary throughout much of the South, received their first major jolt in 1954 with the U.S. Supreme Court decision declaring racially segregated schools to be unconstitutional. The decision was followed by years of increasing protest against other aspects of segregation and by large-scale registration of black voters. Whites reacted to the black protest against segregation with increasing violence during the early 1960s. In 1962 state officials refused to abide by a U.S. Supreme Court ruling that ordered the admission of a black student, James Meredith, to the University of Mississippi. Following a night of rioting during which two people were killed, Meredith was finally admitted and the colour barrier was broken in Mississippi.

The most serious violence occurred in the summer of 1964, when three young civil rights workers were murdered by the Ku Klux Klan. Those murders convinced most white Mississippians that continued resistance and violence was a greater danger to their safety and welfare than was peaceful acceptance of change.

In 1969, under a federal court order, the state's dual segregated school system was unified. Although the great majority of white Mississippians opposed school integration, they adjusted to that change with only minor isolated incidents of violence. Over the next decade Mississippi's long-standing racial traditions and customs were dramatically altered. A succession of enlightened and progressive governors, including Paul B. Johnson, Jr., William L. Waller, William F. Winter, and Ray Mabus, led Mississippi out of its troubled history as a rigidly segregated closed society into a new era of racial cooperation.

After accommodating themselves to such change, Mississippians could at last turn their attention and energy to the development of the state's human and natural resources. Economic development during the 1960s and '70s, though not spectacular, was steady. Out-migration of whites has virtually ceased, and among blacks it has declined significantly. In 1960 Mississippi's income per capita amounted to only 55 percent of the national average, but by 1985 it had risen to 69 percent. This increase was a result of urbanization and industrialization and the decline in agricultural employment.

A development that both paralleled and promoted economic and social progress was the growth of the two-party system. After World War II the Democratic Party lost its monopoly on the state's political process, and the Republican Party now challenges the once-dominant party at every level. This development has shifted the focus of the political debate in Mississippi from a defense of old traditions to a discussion of new alternatives. Although the state's limited natural resources and its long years of agricultural dependency and racial discrimination have left their mark, Mississippi is now largely free of the attitudes and attributes that kept it for so long in the 19th century.

(J.N.B./D.G.S.)

North Carolina

Twelfth of the 13 original states of the United States, North Carolina lies on the Atlantic coast midway between New York and Florida. It is the leading industrial state of the Southern Atlantic states. Approximately one-half of the state's inhabitants live outside urban communities, giving it one of the largest rural populations in the nation.

North Carolina's beginnings are tied closely to the earliest attempts at English colonization of the New World. Roanoke Island in the northeast, a part of the heavily indented and island-fringed coast, was the site of the famous Lost Colony that vanished sometime after the original landing in 1587. This eastern region retains much of the flavour of colonial life, while the higher Piedmont region centred around the capital, Raleigh, has become the state's hub of industry and population. The mountains of the west remain the focus of a lively folk culture and the home of a group of North American Indians.

Bounded on the north by Virginia, on the east by the Atlantic Ocean, on the south by South Carolina and Georgia, and on the west by Tennessee, North Carolina has an area of 52,669 square miles (136,413 square kilometres). Its 3,826 square miles of inland water, the fifth largest such area of any state, are concentrated both in the extensive marshlands of the coastal tidewater and in the lakes and reservoirs of the Piedmont and Appalachian regions. These three physical regions are related to major diversities in life-styles among the people of the state, creating three distinct cultures within the state's boundaries.

PHYSICAL AND HUMAN GEOGRAPHY

The land. North Carolina extends across three major physiographic regions of the United States—the Coastal Plain (or Tidewater), the Piedmont, and the Appalachian Mountains. In addition to giving the state a spectacular landscape, this variation has influenced the character of its climate, soils, plant life, and human geography.

Relief. As the land reaches westward from sea level, it rises gradually to the fall line, a zone some 30 miles (48 kilometres) in width that separates the Coastal Plain from the Piedmont. In the latter, the topography becomes irregular and rises about five feet (1.5 metres) a mile to the base of the Appalachians, a distance of about 140 miles. The mountains, many over 6,000 feet, have a worn, rounded appearance, reflecting a geologic origin older than the rugged peaks of the American West. Mount Mitchell, rising to 6,684 feet (2,037 metres), is the highest peak east of the Mississippi.

Soils. Soils in North Carolina are commonly grouped according to regional variations. Coastal soils are rich and humus-laden, while farther to the west the sandhills consist mostly of sand and have almost no organic materials. The Piedmont region is predominately clayey, and mountain soils are a combination of clay, sand, and silt, commonly called loam. All of North Carolina's soils are affected by excessive leaching, which causes high mineral loss, and successful agriculture depends on large additions of lime and fertilizers.

Climate. North Carolina's climate ranges from medium continental conditions in the mountain region, though summers are cooler and rainfall heavier, to the subtropical conditions of the state's southeastern corner. The growing season ranges from 275 days along the coast to 175 days in the mountains. Average annual temperatures range from 66° F (19° C) in the eastern region, to 60° F (16° C) in the central, and 55° F (13° C) in the mountains. July and August are the wettest months, and October and November are the driest. Annual rainfall varies from 46 to 54 inches (1,170 to 1,370 millimetres) on the coast, 44 to 50 inches in the Piedmont, and 40 to 80 inches in the mountains. Severe storms are rare and heavy snow infrequent. Hurricanes occasionally occur along the coast, and there have been tornadoes inland.

Plant and animal life. Vegetation varies greatly throughout the state primarily because of the geographic and climatic differences of the three main regions. However, changes effected by human habitation are perhaps becoming equally significant. For example, trees that once covered the landscape as dense forests have been cut and burned and now cover only slightly more than 50 percent of the state. Not only has the loss of trees affected animal life by changing important habitats, but it has also contributed to soil erosion and leaching.

A greater variety of plant life is found in North Carolina than in any other state in eastern North America. There are many species of hardwood trees. Red spruce and bal-

Marginal notes:

Tensions between tradition and change

Three major regions

sam fir are found in the mountains, and the subtropical palmetto and the carnivorous Venus's-flytrap grow in the southern coastal area.

The common fauna of North America, including rabbits, squirrels, raccoons, opossums, deer, and also bears and wildcats, are found within the state. The commonest birds are the cardinal, wren, mockingbird, chickadee, and many varieties of woodpecker and warbler. Inland-water fish such as bluegills, crappies, bass, and sunfish are common. Brook and rainbow trout are found in the mountains.

Coastal
Plain

Settlement patterns. Comprising some 45 percent of the state, the Coastal Plain consists of a gently rolling, well-drained interior and a swampy tidewater area close to the coastline. The latter region was the first to be explored and settled. A long chain of islands, the Outer Banks, extends from Virginia to South Carolina, generally covered with sand dunes from a few feet to more than 100 feet in height. Three capes—Cape Hatteras, Cape Lookout, and Cape Fear—jut into the ocean in an area known as the Graveyard of the Atlantic, a reference to the many ships that have gone down in the dangerous waters. The entire area averages less than 20 feet above sea level. Only small-craft navigation is possible because of silting and shallow sounds and estuaries. The Intracoastal Waterway threads its way between the Outer Banks and the mainland on its way from New Jersey to the Gulf of Mexico. The inner Coastal Plain extends from 120 to 140 miles westward to the Piedmont.

Eastern North Carolina has been the citadel of the state's history since Raleigh's dream of colonization came to so mysterious an end. Close to Roanoke Island are the sand dunes of Kitty Hawk, where in 1903 Wilbur and Orville Wright ushered in the age of powered flight. Legends tell of pirate treasure buried beneath the dunes of the Outer Banks. Rusting smokestacks, masts, and boilers protrude from offshore waters, testimony to the more than 2,000 ships that have gone down. Nearby Nags Head got its name, according to tradition, because unscrupulous settlers tied lanterns to their horses' necks and drove them along the coast to lure unsuspecting seamen to the reefs. On Ocracoke Island visitors are astonished at the Elizabethan-sounding speech of the residents, for whom "high tide" is "hoigh toide."

In New Bern, the state's second oldest town, named by its Swiss settlers, is Tryon Palace, a restored palace and garden that has been called the most beautiful building in the colonial Americas. Along the southern coast, fishermen set out to battle large deepwater fish of the Gulf Stream, and in Edenton memories survive of the colonial ladies who held one of the first tea parties to protest duties imposed by the British. Morehead City and Wilmington are the state's two deepwater ports, both significant in world trade, while major military installations in the area add to the state's economic life.

Piedmont
Plateau

The North Carolina Piedmont is a region of rolling, forested hills. The prominent ridges and hills of the eastern Piedmont may be the remains of an ancient mountain chain that paralleled the Appalachians, from which spurs extend into the western Piedmont. The area is well drained by rivers flowing into the Coastal Plain or South Carolina. Dams on the Catawba and Yadkin rivers are important sources of hydroelectric power.

This region is a prime symbol of the New South, in which modern industry has largely replaced the traditional agriculture. A concentration of industry occurs in a sweeping crescent westward and southward from Raleigh to below Charlotte, the state's largest city. Such cities as Durham, Greensboro, and Winston–Salem have made North Carolina the capital of the nation's tobacco industry and significant in textiles and furniture. The colleges and universities that have been so influential in the state's history are centred in this region.

In spite of industry the many antebellum homes in these cities maintain an aura of serenity, and farmlands are still found close to the city limits. The lakes and the upper reaches of the rivers provide havens for fishing and camping, and in many small towns general stores still serve the rural populations. Under the streets of Charlotte—described by Lord Cornwallis, the English general of Rev-

Flue-cured tobacco ready for auction in Oxford, N.C.
Larry Lefever from Grant Heilman

olutionary fame, as "a piddlin little place"—are traces of early mines, which once produced many tons of gold.

The mountain region comprises a highly desiccated intermontane plateau bounded by two ranges of the southern Appalachians. On the east are the Blue Ridge Mountains, which rise steeply from the Piedmont to peaks of 3,000 to 4,000 feet, with several to 6,000 feet or more. In the far west the Unaka Mountains contain the Great Smoky Mountains that roll westward into Tennessee. This region is divided into several cross ridges and a number of smaller plateaus and basins. One of the chief ridges is made up of the Black Mountain group. A total of 43 peaks rise above 6,000 feet and 82 above 5,000 feet in western North Carolina.

Mountain
region

In North Carolina's mountains, ways of life change slowly. Many communities, relatively isolated since the early history of the state, remained self-sufficient until recent times. Wood carving, basketry, needlework, rug and quilt making, and ceramics are among the many cottage industries whose crafts have been passed down through the generations. The isolation has been broken, however, both in the mountains and in the resort centre of Asheville. Winter and summer sports have become popular on the slopes, and the Pisgah National Forest and Great Smoky Mountains National Park are among the areas that attract a growing number of tourists and campers.

The people. Archaeologists have found traces of human habitation in the state that date back some 16,000 years. It is estimated that when the first European explorers arrived there were between 35,000 and 50,000 Indians in the region. In the late 1830s most of the largest remaining group of Indians, the Cherokee, were forcibly removed to lands west of the Mississippi, an exodus recorded in history as the Trail of Tears (1838–39). In the late 20th century about 65,000 Indians lived in the state, making them the largest group east of the Mississippi and the fifth largest in the nation.

Permanent white settlers came into North Carolina in the 1650s from the English colony at Jamestown, Va. Others came down on the great wagon road from Pennsylvania through the Shenandoah valley into the Piedmont. Some came by ship from Europe, all yearning for a plot of land and for freedom from rigid class and religious restrictions. The early North Carolinians were a heterogeneous group, representing a variety of religious faiths, nationalities, and economic and social classes. The Anglican church was

Back-
grounds
of early
settlers

established by law in the early 18th century, but there were also Presbyterians, Quakers, Moravians, Lutherans, Reformed, Baptists, Methodists, and a small number of Jews. Nationalities represented included English, Scottish, Irish, Welsh, Swiss, French, and German.

Blacks were an important part of the early North Carolina population; the labour-intensive crops of rice, indigo, tobacco, and cotton accounted for the spread of slavery in the state, especially after the perfection of the cotton gin. Today blacks account for approximately one-quarter of the population. Despite continuing disparities between the living conditions of whites and blacks, blacks have made impressive gains during the 20th century in education, the arts, sports, business, and politics.

North Carolina's rural and urban populations are approximately equal, despite the large industrial employment. Many industrial plants are located in small towns, and workers tend to commute long distances and live in rural areas. Rapid urbanization and the persistence of extremely rural areas accentuate the demographic contrasts in the state. Traditional patterns of subsistence farming and small farms are giving way to consolidated farms; there also has been a marked decrease in the number of tenants and sharecroppers.

The economy. North Carolina's economy depends largely on industry and agriculture, but tourism is gaining in importance.

Industry and agriculture. Through the first half of the 20th century nearly half of the state's nonfarm work force was employed in manufacturing, primarily of textiles, furniture, and cigarettes. Today manufacturing makes up about one-third of nonfarm jobs, and the industrial base is more diversified. Strong growth has occurred in computers, electronic communications equipment, chemicals, machinery, and a host of other industries. Research Triangle Park, located near Durham, Raleigh, and Chapel Hill, and University Research Park, in Charlotte, have become major focal points for industrial research and development. Economic growth has most dramatically affected the larger cities, especially Charlotte and Raleigh. By the end of the 1980s Charlotte had become one of the largest banking centres in the nation.

Agriculture remains an important industry in the state, although the number of people it employs continues to decline. North Carolina leads the nation in the production of tobacco, sweet potatoes, and turkeys. Other principal agricultural products include peanuts (groundnuts), corn (maize), and eggs. Farm income tends to be greatest in the central and southern counties of the Coastal Plain. Forest products are used for furniture and as a source of pulp for paper. An active reforestation program has resulted in a growth of forest reserves.

Tourism has a diversified base, including the attractions of both ocean and mountains as well as the memorials to the state's past.

Transportation. Geographically, the state is one day's trucking time to New York City or to the rapidly expanding Florida market. Within the state, the highway system accounts for more than 80 percent of freight transportation; most of the remainder is conducted by rail. Raleigh–Durham and Charlotte airports serve as regional hubs for national airlines, thereby providing direct service to many U.S. cities as well as to some international destinations. North Carolina has two Atlantic gateways to world markets. Modern ports are found at Wilmington and Morehead City, both of which are equipped to handle any type of cargo.

Marine traffic

Administration and social conditions. *Government.* The structure of the government of North Carolina is based on constitutions of 1776, 1868, and 1971. Administration of the state is supervised by elected executives, including the governor and lieutenant governor (each limited to two four-year terms, not necessarily consecutive), and by the heads of state agencies, some of whom are elected for four-year terms and some of whom are appointed. The governor has great appointive powers but, as of the late 1980s, no veto over legislation—the only governor in the nation lacking this power. The General Assembly consists of the 50-member Senate and the 120-member House

of Representatives. Both senators and representatives are elected for two-year terms.

The state is divided into more than 30 judicial districts. District courts deal primarily with less serious civil and criminal matters. Each district elects, for four-year terms, its district court judges and a district attorney who represents the state in all criminal matters. The superior courts handle the more serious criminal and civil cases. Superior court judges are elected for each district in statewide elections for terms of eight years. Above the superior courts are the Court of Appeals and the Supreme Court. The latter is the highest state court; it has seven justices elected for eight-year terms. The Court of Appeals was established by a constitutional amendment in 1965 to help relieve the state's Supreme Court. It has 12 judges, all elected for eight-year terms.

North Carolina is divided into 100 counties. County governments act for the state in providing education, health, and welfare services. Locally elected officials include county commissioners, the sheriff, the register of deeds, the clerk of the superior court, and the school board. Compared to those of many other states, North Carolina's government is uncomplicated. In general, counties provide services that apply to all citizens of the state, while municipalities provide the additional services appropriate for urban areas. As urban development has continued, counties have been authorized to offer services that are similar to those provided by municipalities, such as water supply and garbage collection. Because North Carolina's constitution discourages the incorporation of municipalities near existing ones, North Carolina is relatively free from the proliferation of municipal governments in urban areas that is found in many other states.

Throughout most of the 20th century, North Carolina has been dominated by a single party—the Democrats. The vast majority of state and local officeholders are Democrats, but candidates from the rival Republican Party have made major gains. Since 1970 the state has usually voted Republican in presidential elections, has elected Republicans to the U.S. Senate and House of Representatives, and has twice elected a Republican governor.

Education. The public school system, supported by the state since 1933, has improved steadily, though it is still below national levels. Other problems include a relatively low salary scale for teachers and an expenditure per pupil that is below the national average.

In higher education, however, North Carolina has a number of institutions of national standing. The University of North Carolina opened its doors to students at Chapel Hill in 1795 as the first state university in the United States. Since 1972 all 16 senior public institutions have been part of the University of North Carolina, and all are governed by a single board elected by the General Assembly. In addition to Chapel Hill, its campuses include North Carolina State University at Raleigh and the North Carolina School of the Arts at Winston–Salem, the first state-supported residential school for the performing arts. The state's community college system, which comprises some 58 institutions, is one of the largest systems in the United States. Among the dozens of private institutions around the state, most of them established by various Protestant denominations, Duke University in Durham is noted for its undergraduate and graduate programs.

Institutions of higher education

Health and welfare. State-funded hospitals cover a number of specialized areas such as children's orthopedics, alcoholism, retardation and mental illness, cerebral palsy, and tuberculosis. An effective public health program has been in operation since 1877, and each county has a local health department. State aid is provided also to the aged or disabled, to families with dependent children, and to various counseling and other social service programs. The state's social expenditures, however, remain far below the national average.

Cultural life. An arts council, established in 1964 and now a part of the state's Department of Cultural Resources, assists in bringing the highest obtainable quality in the arts to the greatest number of people in the state and also in expanding the role of the arts. The council makes grants of public funds to sponsor numerous proj-

ects. North Carolina was the first state in the country to set aside public funds for the purchase of an art collection. Housed at the North Carolina Museum of Art in Raleigh, the collection spans some 5,000 years, from the art of ancient Egypt to contemporary works.

The North Carolina Symphony has the distinction of being the first state symphony in the country. The orchestra tours the state from September through May. Many of the performances are free matinees for children.

It is in the field of the folk arts and of historical pageantry that North Carolina excels. The many cottage industries of the western mountains combine with those of the coastal communities to offer some of the richest folk culture in the United States. Outdoor epic dramas are held all summer long in Manteo on Roanoke Island, where Paul Green's drama *The Lost Colony* revives the colonizing efforts of Sir Walter Raleigh in the court of Elizabeth I and on the soil of Roanoke itself; in Boone, where *The Horn in the West* recreates such characters as Daniel Boone; and in Cherokee, where *Unto These Hills* is played by the descendants of the Cherokee Indians upon whose history the saga is based.

North Carolina shares with Tennessee the Great Smoky Mountains National Park, which contains approximately 461,000 acres of mountain forestland and includes museums, nature trails, and campgrounds. The Appalachian National Scenic Trail passes through the park, and the Blue Ridge National Parkway begins in the park and extends to the Shenandoah National Park in Virginia. National seashores are located at Cape Hatteras and Cape Lookout. Other National Park Service sites mark the first English settlement on Roanoke Island (Fort Raleigh National Historic Site), the Wright brothers' first flight at Kill Devil Hills (Wright Brothers' National Memorial), the home of Carl Sandburg in Henderson county (Carl Sandburg Home National Historic Site), and the battles at Guilford Court House and Moores Creek.

HISTORY

The proprietary and royal colony. Following the attempts by Raleigh and others to colonize the coastal regions in the 1580s under patents from Queen Elizabeth I, the region remained Indian territory for decades. A grant by King Charles I in 1629 for the lands south of Virginia brought the term Carolina into being, but no permanent settlement was made until farmers and traders from Virginia moved into the Albemarle Sound area in the 1650s. This resulted in a grant from Charles II in 1663 that created Carolina, but for years the settlers resisted the ineffective government imposed by the proprietors in England. Between 1712 and 1729 the separate province of North Carolina was ruled by a deputy dispatched from Charleston, which had become the centre of proprietary government. Boundaries between North and South Carolina were agreed upon in 1735 but not completely surveyed until 1821.

North Carolina's growth was hampered by restrictions on shipping imposed by Virginia on its tobacco crop, by economic and religious quarrels with absentee proprietors that led to several uprisings, by war with the Tuscarora Indians (1711–13), and by coastal piracy involving Edward Teach (Blackbeard) and others. Unlike other colonies, which had grown up around coastal towns that represented the first settlements, North Carolina had no town until Bath was incorporated in 1705. By 1729, when the colony came under royal rule, several other towns had been chartered.

The decades of royal rule saw a turnabout in the colony's fortunes. The population rose rapidly, settlement spread across the Piedmont, and the wealth and quality of life expanded. A large slave population maintained an agricultural economy based on tobacco and rice and on naval stores from the region's extensive pine forests. Prior to the U.S. War of Independence, the beginnings of an intense east–west hostility had grown into several insurrections, but joint antipathy to British rule united North Carolinians and forced the flight of the royal governor in 1775.

Statehood. The war in North Carolina comprised not only a miniature civil war involving the many Tories in the new state but also the suppression of Cherokee up-

Historical
dramas

Effects
of royal
rule

risings in the west. Much of the state's energy went to resolving the conflicting interests of the eastern counties and those of the west until constitutional reforms in 1835 broke the dominance of the east. A period of great economic and social progress, first under the Whigs and after 1850 under the Democrats, was slowed by the furor over slavery and was ended by the American Civil War.

Civil War and after. Unlike South Carolina, whose strident proslavery voices led the South into secession, North Carolina left the Union reluctantly, seeking compromise until the last moment. Once committed, however, the state fought with the Confederacy and experienced the ignominy of defeat and the years of corruption and instability that characterized the postwar Reconstruction throughout the South. The "Bourbon Democrats" who controlled the state after readmission to the Union in 1868 were oriented to the railroad and industrial interests, ignoring the small farmer. Constitutional amendments in 1900 virtually disfranchised the state's black population.

The 20th century. North Carolina in the 20th century has been a part of the national experience of changing economic cycles. A decade of significant economic and social developments followed World War I, but the Great Depression of the 1930s brought widespread hardship and severe curtailment of education and other public services. In the view of some historians, the federal New Deal programs were responsible for more lasting changes in the state than any other force in its history.

In the 1940s the national defense program and World War II affected North Carolina. Some of the country's largest military installations were located in the state, notably Fort Bragg. North Carolina was a major supplier of manufactured war materials and delivered more textile goods to the Army than did any other state.

Impact of
World
War II

After World War II the state began a time of rapid change. New highways were built, and cities grew as new industry and new people moved to the state. Interest in politics revived, and by the 1970s the state again had a viable two-party system. The painful struggle to eliminate racial segregation, beginning in the public schools in the 1950s and at the lunch counters in Greensboro in 1961, absorbed the state's energies for several decades. While most racial segregation had ended by the late 1980s, the state continued to be burdened by the remnants of earlier discriminatory practices and prejudiced attitudes.

North Carolina faces the enormous challenges of extending the benefits of education and economic prosperity to all its citizens, of preserving its environment from the pressures of growth, and of eliminating remaining racial discrimination. The state's economic prosperity, its widely respected system of higher education, and a growing confidence in its role as a leader of the New South give it the resources to face those challenges with optimism.

(Pe.S.G./D.G.M.)

South Carolina

Settled by the English in 1670, South Carolina was one of the 13 original colonies. Its wealthy, aristocratic, and influential colonial society was based on a plantation agriculture that relied on a labour force of black slaves. By 1730, blacks had come to represent two-thirds of the colony's total population. The plantation system spread into the Piedmont in the early 19th century, and the new state became part of the Cotton Belt that stretched across the South. The Civil War shattered South Carolina's economy and influence, and for a century thereafter the state suffered economic, social, and political turmoil. The 1960s brought a major change as South Carolina's economy industrialized, its metropolitan areas grew, and the Civil Rights movement swept across the state.

South Carolina lies on the southern Eastern Seaboard of the United States. Shaped like an inverted triangle with an east–west base of 285 miles (459 kilometres) and a north–south extent of about 225 miles, the state is bounded on the north by North Carolina, on the southeast by the Atlantic Ocean, and on the southwest by Georgia. It is ranked 40th among the 50 states in size and has a geographic area of 31,113 square miles (80,583 square

Location

kilometres). Columbia, located in the centre of the state, is the capital and largest city.

PHYSICAL AND HUMAN GEOGRAPHY

The land. *Relief.* South Carolina can be divided geologically into three separate provinces. A portion of the Blue Ridge Mountains dominates the northwestern corner of the state, covering about 2 percent of the state's area; the highest point in South Carolina, Mount Sassafras, 3,554 feet (1,083 metres), lies on a crest in this region. The Piedmont, with an elevation ranging from about 300 to 1,200 feet, stretches over about a third of the state from the mountains to the midlands around Columbia. The Coastal Plain comprises the southern and eastern thirds of the state, and its elevation varies from about 300 feet to sea level; the 187-mile coastline has sandy beaches and salt marshes. Two major boundaries separate these provinces: the fall line, where rivers form major rapids, divides the sedimentary rocks of the Coastal Plain from the metamorphic rocks of the Piedmont; and the Brevard zone is a fault line separating the Blue Ridge and the Piedmont.

Blue Ridge
Mountains

The rugged Blue Ridge Mountains formed some 250,-000,000 years ago from the collision of the early North American continent with Africa. These mountains and their outliers, such as Table Rock and Pinnacle Mountain, rise 1,000 to 2,000 feet above the Piedmont and constitute an area devoted to wilderness preservation and recreation. Their forests include many northern species, such as white pine and hemlock, relics of the Pleistocene epoch. The poorly developed Blue Ridge soils lack clay accumulation beneath the surface and are not well suited for farming.

The Piedmont has a rolling relief but is much worn down. The reddish Piedmont soils are clayey, with noticeable deposits of calcium, magnesium, and potassium. Planted to grow cotton and corn (maize) for 150 years, the region suffered severe soil erosion. Mid-20th-century abandonment of row crops has allowed the return of forests but not the oak and hickory that typified the 18th century. The most common tree in the Piedmont today is the loblolly pine, vast acreages of which have been planted. At the edge of the Piedmont lie the Sandhills, which run diagonally across the state from Marlboro county to Aiken county. These sandy ridges were formed when the Atlantic Ocean covered the present-day Coastal Plain about 55,-000,000 years ago.

The Coastal Plain is slightly rolling near the midlands and flat toward the coast. The state's agricultural belt dominates the inner Coastal Plain, while the outer Coastal Plain is largely forested. South Carolina's coast was abandoned as an agricultural area around the turn of the 20th century, but good management has allowed truck farming to prosper. Since the mid-20th century it has been the focus of major tourism and recreation development and of intense land-use competition. The Grand Strand is an unbroken beach that extends from the North Carolina line almost to Winyah Bay, but southward the coast is fringed by the Sea Islands that extend into Georgia. The islands

The Sea
Islands

comprise much tidal and freshwater marsh. High pines, gums, live oaks, cypresses, and magnolias are draped with Spanish moss. Many blacks on these islands still speak Gullah, a patois that derives from English and several West African languages and dates to the plantation era.

Drainage. South Carolina's rivers flow generally from northwest to southeast. Three major systems, the Pee Dee in the east, the Santee, whose tributaries drain much of the Piedmont, and the Savannah on the western boundary, cover about 80 percent of the state's area. The Ashley–Combahee–Edisto system comprises the short rivers that form near the Sandhills and flow across the Coastal Plain. Carrying little sediment, their waters are blackened by tannic acid from the swamps along their courses. South Carolina has no large natural lakes; those on the Savannah River and Santee tributaries resulted from hydroelectric development in the 20th century. On the Coastal Plain are hundreds of elliptically shaped depressions of varying sizes typified by swamp vegetation and standing water in the centre. The formation of these so-called Carolina bays is a mystery; some geographers have attributed them to the impact of a comet or meteor.

Climate. South Carolina's climate is subtropical, with hot, humid summers and generally mild winters. Average July temperatures range from 71° F (22° C) in the highland northwest to 81° F (27° C) in the midlands and along the coast. Average winter temperatures vary from 38° F (3° C) in the mountains to 45° F (7° C) in the midlands to 48°–50° F (9°–10° C) on the coast, which is warmed by the Gulf Stream. The growing season ranges from less than 200 days in the northwest part of the state to about 290 days on the Sea Islands. Most of the state receives about 49 inches (1,245 millimetres) of rain annually, but 70 to 80 inches are recorded in the mountains in the northwest. Summer rainfall, typified by afternoon thunderstorms, normally exceeds that of any other season. The state experiences an average of 10 tornadoes a year, usually occurring during the spring. Hurricanes are less frequent, but they do in some years cause damage to South Carolina's coast.

Animal life. The white-tailed deer is the best known of the mammals found in South Carolina. Its population in the Piedmont had declined severely by the 1940s, but restocking from the Coastal Plain and restoration of forests have now ensured its statewide distribution. Other species, such as the beaver and wild turkey, have also made comebacks. Many species, including the bison, wapiti (elk), cougar, and wolf, disappeared by the 1800s, and the black bear is rare today. The red fox and wild pig, both introduced by Europeans, are widespread. Species such as the woodchuck and red squirrel are found in the Blue Ridge, while the Coastal Plain harbours alligators and varieties of all four poisonous snake groups found in the United States. South Carolina has recorded some 360 species of birds. Most faunal species occur statewide, but some are limited to either the Piedmont or the Coastal Plain since the Sandhills create a formidable barrier, especially to reptiles and amphibians.

Settlement patterns. The state's population distribution has changed since World War II. Although South Carolina remains more rural than the nation as a whole, its metropolitan areas have grown and account for more than half the total population. Areas of high density are found in the upper Piedmont, focusing on Greenville–Spartanburg and Anderson; the midlands around Columbia and Florence; and along the coast, including Charleston, Beaufort, and Myrtle Beach. The large metropolitan areas that

© Tom Blagden, Jr
Part of the outer Coastal Plain, in the Cape Romain National Wildlife Refuge, near the Santee delta, South Carolina.

have developed around small cities during the automobile era now have overwhelmingly suburban populations.

The people.   Native American Indians inhabited what is now South Carolina for thousands of years before white settlement. Though their population declined rapidly after European contact, a few thousand still reside in the state. The largest group are the Catawba, who have a small reservation in Lancaster county.

South Carolina's colonial population was a mixture of European nationalities. Settled initially from England and Barbados, the colony by the 1680s was receiving Scots and a number of Huguenots escaping France after the revocation· of the Edict of Nantes. Some of the French later settled in the western part of the state near Abbeville. Germans moved into the midlands in the 1730s, locating along the Saluda River, while Welsh Baptists settled the Welsh Tract on the Pee Dee River. In the 1750s and '60s, Scotch-Irish settlers from Pennsylvania and Virginia spread into the South Carolina Piedmont. In the 19th century, however, few of the millions of European immigrants that flooded the United States settled in South Carolina. Today, nearly a quarter of the state's small number of foreign-born residents are recent arrivals from Asia.

Five blacks were among the 148 original colonists in 1670. In 1880 the black population represented almost 61 percent of the state's total population, but heavy out-migration to largely urbanized Northern states during the 20th century saw this decline to about 31 percent in 1970 before stabilizing.

Throughout the first half of the 20th century, South Carolina's population grew much more slowly than that of the nation as a result of out-migration of both blacks and whites. By the 1970s this began to change, and South Carolina's growth rate has since exceeded the national average. Almost three-quarters of South Carolina's more than 3,000,000 residents were born in the state, but metropolitan areas, especially in the midlands and along the coast, show smaller percentages of South Carolina natives, while rural counties show much higher percentages.

The economy.   During the first half of the 20th century, agriculture was the key to the state's economy, but by 1923 the value of manufactured goods exceeded that of agricultural products. Agriculture continues to be important, but its role has declined as manufacturing and service employment have increased. South Carolina's industry is typified by low-wage, nondurable-goods manufacturing.

Resources.   South Carolina's major resources include its climate and forests. Known for sunny summer beaches, the state seeks a year-round tourism based on golf and other recreational activities. Forests cover about 65 percent of the state and contribute sawtimber for lumber and pulpwood for paper production; tourism and forestry are the state's second and third leading industries, respectively. Mineral resources include clay, sand, gravel, and crushed stone (granite and limestone); and a 19th-century industry, gold mining, has been revived to a limited degree.

Agriculture and fishing.   Since World War II the number of farms has declined nearly 85 percent, and land in farms has fallen from more than one-half to about a quarter of the state's land area. Another major change has been the virtual disappearance of cotton. Once planted almost across the state, it is limited now to only a few counties in the inner Coastal Plain. The major crop in cash receipts since the 1950s has been tobacco, grown principally in the Pee Dee region. By far the largest acreage is devoted to soybeans, a crop introduced successfully into South Carolina only in the 1940s. The state has long been famous for its peaches, grown in the upper Piedmont and in the midlands. Previously of little value, livestock and poultry have come to play an increasingly important role in the agricultural economy, especially in the Piedmont. The important coastal commercial seafood industry includes shrimp, crabs, and oysters.

Industry.   At the beginning of the 20th century many textile mills began operation in the upper Piedmont and midlands, and by 1910 almost 150 mills employed 45,-000 workers. Although today suffering severe competition and a steady decline, textiles remain the state's leading industry, accounting for more than a fourth of the man-

ufacturing employment. Other major industries include wearing apparel, paper, machinery, and chemicals. This industrialization has resulted from the opening of many branch plants by companies from the northern United States. On a per capita basis the state also is one of the leading recipients of foreign capital investment.

Transportation.   South Carolina is crisscrossed by interstate highways that link it with every part of the country, but railway mileage has declined. The two major railroads continue to abandon branch lines serving smaller towns, although a few of these are now operated as independent short lines. Major air carriers serve the metropolitan centres of Greenville–Spartanburg, Columbia, and Charleston, as well as Myrtle Beach, while commuter airlines connect smaller cities with regional hubs. The State Ports Authority has developed Charleston into the major container port on the South Atlantic coast and also operates port facilities in Georgetown and Port Royal.

Administration and social conditions.   *Government.* State government operates under the 1895 constitution, which has, however, since 1968 been rewritten article by article by the General Assembly, each amendment being submitted for voter approval. The governor, the state's chief executive, is elected to a four-year term, and an amendment in 1980 allowed reelection to a second consecutive term. The lieutenant governor serves as ex officio president of the Senate and succeeds the governor in the event of an uncompleted term. Other constitutional officers, all elected for four years with no limitation on consecutive terms, are secretary of state, treasurer, attorney general, comptroller general, adjutant general, superintendent of education, and commissioner of agriculture. The governor, although able to veto bills and specific items in the budget, has much less authority over state government than does the legislative branch. The General Assembly comprises two houses: the Senate and the House of Representatives. Originally, each county had one senator and at least one representative, but the U.S. Supreme Court declared that apportionment unconstitutional. In 1974 the House was divided into 124 single-member districts of equal population, and in 1984 the Senate was divided into 46 districts. Senators serve four-year terms, and representatives serve two-year terms.

Judicial authority is vested in the Supreme Court, and all courts are unified under the administration of the chief justice. The Supreme Court comprises the chief justice and four associate justices. All are elected by the General Assembly for 10-year terms, which are staggered so that one justice is elected every two years. The Court of Appeals, created in 1983, has a chief judge and five associate judges that sit in three-judge panels. It automatically hears all appeals from lower courts, except for cases involving death penalties, elections, constitutionality of laws, actions of state regulatory agencies, and bonded indebtedness, which go directly to the Supreme Court. The state is divided into 16 judicial circuits served by circuit courts; these courts have the widest jurisdiction and hear civil (Court of Common Pleas) and criminal cases (Court of General Sessions).

The 1895 constitution had no provision for local government, and the county legislative delegation, with approval of the General Assembly, decided most local matters. The Local Government Act of 1975 transferred some authority to local administration. The act identified the forms of government that could be adopted by the 46 counties and almost 300 municipalities and defined their responsibilities, powers, and taxing authority.

For more than a century, South Carolina politics was dominated by an all-white Democratic Party. The 1960s brought two developments: the rise of the Republican Party, whose strength lay in the suburban metropolitan counties, and the Voting Rights Act, which allowed black participation in the electoral process and paved the way for election of blacks to local offices and the General Assembly. Although Democrats continue to hold sway at the state level, Republicans have made inroads in congressional representation, the governor's office, the General Assembly, and county councils in metropolitan areas.

Education.   Public education was guaranteed under the

The
ethnic mix

Decline of
cotton

Revised
constitu-
tion

1868 Reconstruction constitution, which created the Superintendent of Public Instruction. The State Board of Education today certifies teachers, sets standards, and establishes courses of study for the public schools, which are grouped into approximately 90 local districts. Educational attainments have improved at all levels, but South Carolina has long scored near the bottom in such rankings as percentage of high school graduates and public school teacher salaries. To improve the situation, the General Assembly has equalized funding for education across school districts and established minimum standards of educational achievement. The Education Improvement Act, passed in 1984, increased state funding for education to improve student performance.

Colleges and universities

The largest institution of higher education in the state is the University of South Carolina in Columbia, chartered as South Carolina College in 1801 and opened in 1805. Clemson University, a land-grant institution established in 1889, has a major research and teaching focus on agriculture. Winthrop College (1886), located at Rock Hill and long known as South Carolina College for Women, is now coeducational. The Citadel, one of the few state-supported military colleges, is located in Charleston, as is the Medical University of South Carolina. South Carolina State College in Orangeburg was chartered originally as a black college in 1896; Francis Marion College in Florence was established in 1970; and the College of Charleston, the oldest publicly supported institution in the United States, founded in 1770 and chartered in 1785, officially became a part of the state college system in 1970. Throughout South Carolina are many private institutions supported by Protestant denominations.

Health and welfare. County health departments provide basic health services from prenatal care to immunization, but South Carolina still faces some severe problems. It has one of the highest infant mortality rates and lowest life expectancies of the 50 states and ranks low in the number of physicians per 100,000 population. The metropolitan areas have excellent hospital facilities and some of the most advanced medical technologies, enhanced in Charleston and Columbia by the two medical colleges. The rural counties, however, struggle to maintain local hospitals.

Underlying the health problem is poverty, and South Carolina, despite great economic strides, remains among the states with the highest percentage of persons below the poverty level. Within the state, this has a specific geographic pattern: more than a quarter of the residents of the rural counties across the Coastal Plain are identified as below the poverty line.

Cultural life. Charleston was the cultural centre of the South during the colonial period and early 19th century. The Charleston Library Society, founded in 1748, provided the literary focus; the St. Cecilia Society, formed in 1762, regularly held public concerts; the Dock Street Theater, opened in 1736, was one of two theatres in Charleston and perhaps the site of the first play produced in the United States; and scientific interests underlay the foundation of the Charleston Museum in 1773. All of these institutions continue today.

Literature

William Gilmore Simms was the most successful and prolific writer of the antebellum South. Julia Peterkin (1880–1961), one of the first to describe the plantation from the perspective of blacks, won the 1928 Pulitzer Prize for Literature. Archibald Rutledge (1883–1973) served for 39 years as the state's first poet laureate. DuBose Heyward achieved his greatest success in 1925 with the novel *Porgy,* which provided the basis for George Gershwin's opera *Porgy and Bess.* The humorous short stories about local life by William Price Fox have received critical acclaim, and James Dickey, a longtime resident of South Carolina, is among the most widely read American poets.

Portraiture was the dominant form of art in colonial and early 19th-century South Carolina and was exemplified by the work of Henrietta Johnston (d. *c.* 1729) and Charles Fraser (1782–1860), a well-known miniaturist. Washington Allston is considered the first important American painter of the Romantic movement. The black artist William Henry Johnson (1901–70) has received notice for his paintings in the so-called primitive style. The sculp-

tural work of Anna Vaughn Hyatt Huntington (1876–1973) forms the core of the internationally known Brookgreen Gardens near Georgetown. The paintings of Jasper Johns, who was born and raised in South Carolina, have been exhibited at major museums throughout the world.

Among South Carolina's notable art collections are those of the Gibbes Art Gallery in Charleston, emphasizing 18th- and 19th-century portraiture, and the South Carolina State Museum in Columbia, which houses the State Arts Commission's collection of contemporary South Carolina artists. The McKissick Museum of the University of South Carolina has developed collections and exhibits of indigenous folk art, including Edgefield and Catawba pottery and Afro-American basketry.

The Spoleto Festival

The Spoleto Festival in Charleston was founded in 1977 by the Italian opera composer Gian Carlo Menotti as the New World branch of his Festival of Two Worlds in Spoleto, Italy. The annual event features hundreds of actors, singers, dancers, musicians, and other artists in more than 100 performances. Of a more recreational character are the many harvest-based and local festivals held by small towns across the state.

Charleston is noted for its splendid, well-preserved 18th-and 19th-century houses and public buildings. Beaufort and Georgetown also have well-maintained historic districts, and many other South Carolina cities have preserved buildings, restored the architectural integrity of downtowns, and designated historic areas.

HISTORY

Earliest settlement. The first inhabitants of present-day South Carolina arrived about 11,000–12,000 years ago. Hunting and gathering typified their first 10 millennia, but they developed agriculture about 1000 BC. The Mississippian peoples, the most advanced in the pre-Columbian Southeast, arrived about AD 1100 with their complex society, villages, and earthen mound-building, but they disappeared soon after European contact. Perhaps 15,000–20,000 Indians resided in South Carolina in 1600, representing three major language groupings: Siouan (Catawba), Iroquoian (Cherokee), and Muskogean (related to Creek). Disease, conflict, and continued European expansion contributed to the virtual disappearance of the Indian population by the time of the U.S. War of Independence.

Colonization. The first Europeans to visit South Carolina, in 1521, were a party of Spaniards from Santo Domingo (Hispaniola). In 1526 Lucas Vásquez de Ayllón led a colony of Spaniards in the earliest settlement of what is thought to have been South Carolina, but it failed within a few months. French Protestants under Jean Ribaut made an unsuccessful attempt to occupy the area of Port Royal in 1562. A few years later, in 1566, the Spaniards returned and established Santa Elena on Parris Island. It was an important Spanish base until 1587.

Colonial charter

In 1665 Edward Hyde, 1st Earl of Clarendon, and seven other lords proprietor received a charter from King Charles II to establish the colony of Carolina (named for the king) in a vast territory between latitudes 29° and 36°30′ N and from sea to sea. Under it, the English made the first permanent settlement on the west bank of the Ashley River at Albemarle Point in 1670. A decade later, the government and most inhabitants moved to a more favourable location on the peninsula formed by the Ashley and Cooper rivers, the site of Charleston today. The colony grew slowly and by 1720 had a population of about 19,000, settled almost exclusively along the coast. Trade with the Indians and export of deerskins constituted the major sources of income, complemented by naval stores after 1710. Conflicts with the lords proprietor over economic support, Indian trade, and authority of the Commons House resulted in the overthrow of proprietary rule in 1719.

In 1729 the colony was divided into two provinces, North and South; Georgia was carved out of the southern part of the original grant in 1731. Under crown rule, South Carolina prospered, and exports of rice and indigo contributed to its growing wealth. Based on this successful trade, Charleston entered its golden age, and its much-envied refinement and cultural attainment made it a leading city in the colonies. The flood of Scotch-

Irish settlers overland from Pennsylvania saw a population explosion in the interior after 1760 and demands for political representation, resulting in a conflict between the Low Country (coast) and Up Country that continued into the 19th century. British troops occupied Charleston in 1780, but much of the Revolution was fought as a civil war between patriot and loyalist South Carolinians. Two major American victories were the battles at Cowpens and Kings Mountain.

Statehood, Civil War, and aftermath. In 1788 South Carolina became the eighth state to ratify the U.S. Constitution. The relocation of the state capital in 1786 from Charleston to the newly created city of Columbia in the interior was intended to reduce the regional conflict, but the 1790 constitution continued Low Country dominance of the government. After the proliferation of the cotton gin by 1800, the cotton plantation and slavery moved into the Piedmont and created common interests between the two regions. The Up Country also benefited from internal improvements that included a canal-building program.

The Denmark Vesey slave revolt in 1822 contributed to a climate of anxiety in South Carolina over the slavery issue, and the high tariffs of 1828 precipitated talk of disunion. South Carolina proposed a convention in 1832 to nullify tariff laws, but no other Southern state supported it. Senator John C. Calhoun, the architect of nullification, was the major spokesman for the South until his death in 1850. Radicals such as Robert Barnwell Rhett led South Carolina to secede from the Union in December 1860, and the firing on Fort Sumter in April 1861 began the Civil War. Four years later, General William T. Sherman's troops had burned their way through the state and the Confederacy had surrendered. Some 60,000 South Carolinians had gone to war; nearly a quarter never returned.

Reconstruction (1867–77) was a bitter era, marked by military occupation, disfranchisement, and corruption, but the 1868 constitution did establish basic political equality and committed the state to public education. The election of Wade Hampton as governor in 1876 was facilitated by fraud and intimidation of blacks. Hampton was not allowed to take office until 1877, however, when Reconstruction ended and the era of "Bourbon rule" by the "old guard" planters and merchants began.

The conflict between Up Country and Low Country became a struggle between the poor and the propertied. The former voted Benjamin R. Tillman into the State House in 1890 to end the Bourbon era. A leader of the farmers' movement and a blatant racist, "Pitchfork Ben" held office until 1894 and served in the U.S. Senate from 1895 to 1918. The farmers'—or, more broadly, "reform"—movement was marked by the establishment of Clemson Agricultural College (later Clemson University) and Winthrop Training School for Teachers (later Winthrop College), the dispensary system of state liquor monopoly (later abandoned because of corruption), and the 1895 constitutional convention that disfranchised blacks as much as possible. "Tillmanism" remained a major political force into the 20th century.

The modern era. After World War I, cotton prices collapsed, and the boll weevil destroyed up to half the cotton crop in 1922. This disaster, which caused a wave of out-migration, was followed after 1929 by the Great Depression. Many New Deal programs benefited the state, including construction of the Santee–Cooper hydroelectric complex funded by the Works Progress Administration (WPA).

South Carolina underwent economic, demographic, social, and political revolutions after World War II. Between 1950 and 1980, nonagricultural employment grew three times faster than the overall population as the State Development Board, created in 1945, actively recruited industry. Income per capita increased dramatically and reached 77 percent of the national average by the 1980s. The economic revolution was paralleled by a demographic revolution as urban population grew 17 times faster than the rural population. After 1975 new economic opportunities reversed migration patterns as more people, both black and white, moved into South Carolina than left it. The social revolution that ended racial segregation included

some tragic events, such as the Orangeburg Massacre, in which three blacks died in a confrontation with state police on the South Carolina State College campus. Moderate governors, such as Ernest F. Hollings (1959–63), Donald S. Russell (1963–65), Robert E. McNair (1965–71), and John C. West (1971–75), led South Carolina through this difficult but generally peaceful era. The political revolution involved both the rise of the Republican Party and the increased participation of blacks, who by 1970 accounted for about a quarter of the state's registered voters. Strom Thurmond, first elected to public office in 1946, successfully accommodated the changing electorate. He was the presidential nominee of the segregationist States' Rights Democratic Party ("Dixiecrats") in 1948 and became a Goldwater Republican in 1964. Thurmond served in the U.S. Senate from 1954 with wide support, becoming a nationally recognized spokesman for Southern conservatives.

In the era of the so-called New South, South Carolina's achievements have brought new challenges. Sustainable economic growth calls for further diversification of the industrial base, coupled with increased protection of the environment. Improved health services, educational programs, and employment opportunities, especially in rural counties, are needed to help distribute the benefits of economic growth to all South Carolinians.   (J.J.W./D.O.B.)

Tennessee

Located in the upper South of the eastern United States, Tennessee became the 16th state of the Union in 1796. It embodies so many diverse elements of the nation that it constitutes a virtual microcosm of the country. Early pioneers in East and Middle Tennessee, far removed from established authority, set precedents of self-government that are identified with the frontier tradition. From the beginning, Tennesseans, despite loyalty to the larger society, found that they had to rely on themselves for security. This nurtured a spirit of independence, which persists today. Furthermore, the geographic diversity has created a variety of economic, social, and cultural patterns within the state. While the East is well known for its mountain tradition, the Bluegrass area of Middle Tennessee is a balanced agricultural and commercial region, and the West has an economy based largely on cotton and the Mississippi River, with closer ties to the Deep South. Even though Tennessean Andrew Jackson long symbolized the Democratic Party of the common people, the rival Whig Party carried the state for many years. Strongly divided by the Civil War and its own version of Reconstruction, Tennessee became a part of the solid Democratic South, lagging in wealth and prestige behind the rest of the nation. The dreams of the industrialists of the late 19th century were not realized until the second part of the 20th. In the 1970s, with the return of the Republicans to prominence, Tennessee became once again a two-party state. As the South has become a part of the Sunbelt, the state has shared in this emerging prosperity.

The geography of Tennessee, an area of 42,144 square miles (109,153 square kilometres) is unique. Its extreme breadth of 432 miles (695 kilometres) stretches from the Appalachian Mountain boundary with North Carolina in the east to the Mississippi River borders with Missouri and Arkansas in the west. Its narrow width, only 112 miles, separates its northern neighbours, Kentucky and Virginia, from Georgia, Alabama, and Mississippi on the south. Nashville is the capital and Memphis the largest city.

PHYSICAL AND HUMAN GEOGRAPHY

The land. *Relief.* The state is divided into six natural regions. In the extreme eastern part of the state lie the Unaka Mountains—a section of which is popularly known as the Great Smoky Mountains—with 16 peaks that rise above 6,000 feet (1,830 metres); the tallest of them, Clingmans Dome, rises to 6,643 feet (2,025 metres). The Great Valley of East Tennessee, varying from 30 to 60 miles in width, includes a series of low ridges that rise above the intervening valleys. The Cumberland Plateau has a generally flat, slightly undulating surface cut by deep and sometimes wide river valleys. The Interior Low Plateau

[margin notes, left column:] Nullification and secession

Demographic revolution

[margin note, right column:] Peaks, plateaus, and plains

in Middle Tennessee is dominated by the Nashville, or Central, Basin and the Highland Rim. About 60 miles wide, and running roughly north to south across the state, the basin floor is a slightly rolling terrain punctuated by small hills known as knobs. To the west, the eastern Gulf Coastal Plain undulates only slightly and is laced with meandering, low-banked streams. In the extreme west, the plain ends in the Mississippi alluvial plain, a narrow strip of swamp and floodplain alongside the river.

Drainage and soils. The land drains directly into three major rivers. The Tennessee River, which flows southward in the east and northward in the west, drains the east, the southern part of the middle region, and a major part of the west. The Cumberland River, dipping into the state from the north, drains the upper middle region, while the Mississippi River directly drains a small portion of the west. The damming of the Tennessee and, to a lesser extent, of the Cumberland has created an impressive chain of slack-water lakes, sometimes known as the Great Lakes of the South, many of which lie in Tennessee. The valleys and upland basins of Tennessee have moderately fertile Types of soils soil of limestone origins, and the streams have created rich alluvial lands along their beds. The soils of the ridges and the plateau, however, are thin, stony, and moderately acid, while the coastal plain has a sandy, thin soil that does not support agriculture. Approximately one-third of the soils of the state are unfit for any kind of cultivation, but four-fifths of the total land area is used for crops, livestock, timber, or other agricultural products.

Climate. Tennessee has a moderate climate featuring cool, but not cold, winters and warm summers. The drop in elevation causes temperatures to rise significantly from east to west. The average high temperature is 85° F (29° C); the average low temperature is 30° F (−1° C). The growing season ranges from 130 days in the mountainous east to nearly 240 days at Memphis. Most of Tennessee is within the range of 160 to 220 days. The state receives ample precipitation, about 52 inches (1,321 millimetres) a year, rather evenly distributed over the seasons and regions.

Plant and animal life. Because of the state's central position in the eastern half of the United States and its diverse elevations, many plants, animals, and fish identified more with the extreme northern and southern parts of the nation are found in the state. About one-half of Tennessee is forested, and there are more than 200 species

Forested summits of the Great Smoky Mountains, a section of the Unaka Mountains, in eastern Tennessee.

of trees, of which some 60 are commercially valuable. Such trees as locust, poplar, maple, oak, elm, beech, pine, spruce, walnut, hickory, and sycamore are found throughout the state.

Settlement patterns. The first white settlers found their way to river valleys in upper East Tennessee and then to Middle Tennessee north of the Cumberland River. In the early part of the 19th century, pioneers moved south in these regions. West Tennessee was purchased from the Chickasaw in 1818, but the Cherokee retained a small portion of lower East Tennessee until their removal in 1838.

Unlike the Deep South, in which huge plantations were the symbol of the cotton empire, Tennessee developed largely as an agglomeration of smaller farms. Small farms and small towns still characterize much of the landscape of the state. Six of the state's major cities and their surrounding counties have attained metropolitan size, reflecting Tennessee's growth in population, industry, and urbanization at a generally more rapid pace than that of its neighbours. Knoxville, the site of the oldest and largest campus of the University of Tennessee, and Chattanooga, where in 1863 Confederate and Union soldiers clashed on Lookout Mountain, are the major centres of East Tennessee. Nashville, the state capital and the cultural centre of Middle Tennessee, is perhaps best known as the national capital of country music. Clarksville, 50 miles northwest of Nashville, is the centre for dark-fired tobacco and the home of the 101st Airborne, which is based at nearby Fort Campbell, Ky. Jackson, an old frontier town and transportation centre, is in the heart of West Tennessee, a region acquired from the Chickasaw in 1818 as the "Jackson Purchase." Memphis is the hub of West Tennessee, and its history includes its major role in the Mississippi River steamboat traffic and its prominent and colourful position in the development of jazz. Three smaller cities in northeastern Tennessee are considered together as the state's seventh metropolitan area.

The people. The original white settlers were of predominantly Scotch-Irish and English stock, although Germans were well represented. Black slaves were present from the beginning of white settlement, enduring with their masters the privations of frontier life. Initially few in number, slaves and free blacks had a measure of liberty. Antislavery societies and journals flourished in the eastern part of the state until the opening of plantations in Middle and West Tennessee brought increasing numbers of slaves to the state. During the Civil War blacks defended the Union as civilian workers and as soldiers. They served in the state legislature during Reconstruction but were given few positions of leadership by the Republicans. Losing political power after Reconstruction, blacks played only a limited role in politics until the 1960s.

The Cherokee, the only Indian people who actually lived The Cherokee heritage in Tennessee during most of the 18th century, were originally allies of the English traders, but they eventually began to resist the flood of settlers that poured into the area. Ceding bits and pieces of land in a series of treaties, the Cherokee adopted ways of the whites in the hope that they could live in peace. One leader, Sequoyah, created an alphabet for his people, enabling them to write and read their language for the first time. They became farmers, and, in some cases, slave owners, prospering in ways that aroused the envy of their white neighbours. Thus, the pressure for Indian land increased. A minority faction ceded their remaining land in Tennessee in a treaty that was enforced by the U.S. government. The result was the forcible removal of most of the remaining Cherokee to Oklahoma in the tragic Trail of Tears in 1838–39.

Women have played a prominent role in the life of the state from early pioneer times. Long active in religious and cultural pursuits, women began to organize in the latter part of the 19th century to gain the vote. These efforts accelerated in the 20th century and were crowned with success in 1920, when Tennessee's approval of the Nineteenth Amendment gave the vote to all American women. In recent years women in the state have become increasingly prominent in business, politics, education, literature, entertainment, and the arts.

People from other regions and nations have come into

Tennessee in recent years because of increased economic opportunities. They have generally found a warm welcome, and have, in turn, enriched the state through their energies and varied cultural patterns.

Religion has been important in Tennessee from the days of early pioneers. Presbyterian ministers reinforced a belief in divine Providence as settlers faced the hazards of nature, Indians, and internal divisions. Baptists soon outnumbered Presbyterians in Tennessee, and the Methodist circuit rider became a significant figure in the area. The Great Revival of 1800, spawned in nearby Kentucky, intensified the importance of religion in the state, where two new denominations emerged: the Cumberland Presbyterians and the Disciples of Christ, or Christian church. As immigration increased, so did religious diversity. Episcopalians, Lutherans, Roman Catholics, and Jews were all strong in the state before the Civil War. North–South division of denominations preceded the division of the Union. In the late 19th century the concern over the prohibition crusade caused denominations to join forces to combat the evils of drink. While this issue was still important in the early decades of the 20th century, churches also turned their attention to missions, urban problems, and church organization. Still, the popularity of itinerant evangelists signified the persistence of the revivalist tradition in Tennessee. In addition, churches concerned themselves with social needs during the Great Depression and in World War II, with the Civil Rights movement of the 1950s and '60s, and, later, with the homeless.

In recent years the most rapid growth in the state has been in East and Middle Tennessee and the West Tennessee county of Tipton. The highest increases in population have been in fringe areas around the largest cities. While Tennessee exchanges population with other states, more people come from Florida, Kentucky, and Virginia than go from Tennessee to these states. Tennessee's percentage of native-born citizens is higher than the national average, although a significant number have lived outside the state for a time. In Tennessee, as in the nation as a whole, the number of households has increased, particularly single-person housholds. While the median age has increased, the distribution of population by race has remained extremely stable since 1970.

The economy. Manufacturing dominates the state's economy, accounting for nearly a third of the total state product.

Industry. The major products manufactured in the state are chemicals, foods, aluminum, rubber products, nylon, and whiskey. Because of the dependence on manufacturing, recent administrations have sought to attract industry to Tennessee. As a result, many firms, some from Japan, have located plants in the state. Tourism is an important industry because of the scenery, the facilities in parks, the abundance of historic sites, and entertainment facilities. Tennessee is also a centre for insurance, printing, and the recording of music. There has been an increase in service jobs in the state.

Agriculture, mining, and energy. The main crops are soybeans, tobacco, cotton, corn, and small grains, but livestock nearly equals crops in terms of cash receipts. The leading products in forestry are from oak, hickory, poplar, elm, pine, and cedar. Coal is the major mineral resource, followed by stone, zinc, phosphate rock, copper, and marble. Long known for Tennessee Valley Authority (TVA) dams and nuclear research at Oak Ridge, Tennessee has made important contributions in energy production. The TVA was established in 1933 to develop the resources of the Tennessee River valley. The nation's largest electric-power generating system, it has also improved navigation and controlled flooding on the Tennessee River and has aided industrial development throughout the Tennessee River valley.

Transportation. Tennessee's river system is a vital component of the state's transportation complex. Railroads remain important, despite a general decline. The most notable recent addition to the highway system has been the network of interstate routes and urban beltways. Nashville and Memphis are important regional transportation centres, not only in highways but also in air travel.

Administration and social conditions. *Government.* The constitution of 1870, drawn up after Reconstruction, closely resembled the original document of 1796. Despite the recognized need for revision in the following decades, the amendment process itself remained difficult. Hence, it was not until 1953 that the document was actually amended, although the government had been reorganized by statute in the 1920s and '30s. The 1953 and subsequent amendments helped to modernize the state government. Among the changes effected were clauses that simplified the complicated amendment procedure, increased the terms of the governor and state senators from two to four years, increased the pay of state legislators, provided for annual rather than biennial meetings of the state legislature, abolished the poll tax, and increased the power of cities to govern themselves independently of the state.

The structure of the executive, legislative, and judicial branches of government in Tennessee resembles that of many other states. The governor is the only executive official elected statewide. The speaker of the state Senate serves as lieutenant governor. Other executive officers are elected by the legislature, while the attorney general is appointed by the Supreme Court. Executives of major departments and important state commissions are appointed by the governor. The bicameral General Assembly comprises the 33-member Senate and the 99-member House of Representatives. Representatives are elected for two-year terms. The General Assembly can override a governor's veto by a simple majority.

The judicial system consists, on the local level, of general sessions judges who act as committing magistrates and enjoy limited civil jurisdiction. Above these is a complex of inferior courts—chancery, circuit, criminal, and probate—that try various types of cases. The Court of Appeals, the Court of Criminal Appeals, and the Supreme Court have their judges apportioned among the three "grand divisions" of the state (East, Middle, and West Tennessee). Judges on the local level are elected by the voters of their respective counties. On the next level, judges are elected from their respective chancery divisions and circuits. The members of the Court of Appeals and of the Court of Criminal Appeals are elected by the state at large under the Missouri Plan. The members of the Supreme Court are elected by the voters of the state at large. All terms are for eight years.

Local government follows the national pattern. A county commission consisting of commissioners from the civil districts into which the counties are divided constitutes the legislative authority of most of the state's 95 counties. School boards, either elected or appointed, administer the schools under the direction of county superintendents. Popularly elected sheriffs enforce the criminal laws, and elected officers collect the property taxes and record real estate transfers. The chief executive officers of the counties are the county executives. Types of city government include the council–manager, mayor–council, and commissioner systems. In 1962 Nashville and Davidson county merged into a single governmental unit, called Metropolitan Government, or Metro. This experiment has been considered a success in solving problems of overlapping or conflicting authority in city and county governments.

Education. Almost half of every state tax dollar goes to public education. The State Board of Education administers elementary and secondary education in the state. One notable innovation has been the Better Schools program, which rewards teachers for upgrading their credentials and for their performance in the classroom. In the elementary schools there has been increased emphasis on art, music, and physical education, while on the secondary level requirements in math and science have been increased. The Tennessee Higher Education Commission coordinates the work of two boards, the University of Tennessee Board of Trustees and the Board of Regents of the State University and Community College System of Tennessee. The University of Tennessee system consists of campuses at Knoxville, Memphis (the medical school and other schools related to health services), Martin, and Chattanooga. There are six regional universities: Austin Peay (Clarksville), East Tennessee (Johnson City),

[margin notes:]
Revivalist tradition

Tennessee Valley Authority

Experimentation in local government

Memphis State, Middle Tennessee State (Murfreesboro), Tennessee State (Nashville), and Tennessee Technological (Cookeville). There are several community colleges and technical institutes. Tennessee has long been known for its private colleges, of which Vanderbilt and Fisk universities, both at Nashville, and the University of the South at Sewanee are perhaps the best known.

Health and welfare. The increased longevity of Tennesseans is in part attributable to improved health facilities, characterized by outstanding medical centres in the major cities. The Department of Human Services has expanded its program in an attempt to meet the growing needs of the underpriviledged in society. In addition to basic welfare services, the state concerns itself with foster care, adoptions, licensing of day-care centres, prevention of child abuse, and provision of services for the handicapped.

Cultural life. The geographic, economic, and social divisions of the state are reflected in a diversified culture. The self-reliance of the pioneer tradition helped to shape the music, crafts, and legends of East Tennessee, while the slave heritage of West Tennessee blacks gave rise to the blues. Memphis has long been a centre for the arts, with special emphasis on music and the theatre. Middle Tennesseans brought religious, educational, and other cultural institutions into their region to mitigate the crudeness of frontier life. In more recent times Nashville has become the cultural as well as the political capital of the state, weaving traditional patterns of the three "grand divisions" with contemporary trends in music and literature. Beginning in 1925, when the "Grand Ole Opry" radio program was first broadcast, Nashville has been the centre for country music, including recording and publishing. Modern literature also has important ties to Nashville. In the 1920s the so-called Fugitive poets, associated with Vanderbilt University, gained international attention. Four of them, John Crowe Ransom, Donald Davidson, Allen Tate, and Robert Penn Warren, joined with eight other writers in contributing essays for *I'll Take My Stand* (1930), a defense of traditional agrarian culture against the changes in values associated with industrialization. This theme persists in the work of a number of distinguished Tennessee writers, of whom Peter Taylor is probably the best known.

The completion of the Tennessee Performing Arts Center in Nashville has led to a flowering of cultural life in music, theatre, and dance. Exhibits of contemporary and earlier art as well as historical artifacts at the Tennessee State Museum, also in Nashville, demonstrate the cultural richness and vitality of the state.

Large numbers of vacationers visit the state each year. Opryland USA, a musical theme park featuring the Grand Ole Opry, is a major attraction. The natural beauty of the region draws visitors to Great Smoky Mountains National Park (shared with North Carolina), the largest national park in the eastern United States, and to Tennessee's 51 state parks, many of which encompass man-made lakes. In addition, there are many historic sites, of which the Hermitage, home of Andrew Jackson, near Nashville, and the Civil War battlefield of Shiloh are the most famous.

(S.McC.H/J.A.Ho.)

HISTORY

Prehistory and settlement. The first inhabitants of Tennessee are believed to have been Ice Age hunters descended from Asians who crossed the former Bering Strait land bridge more than 20,000 years ago. They were succeeded by various groups, who refined hunting methods and ultimately developed a life based on agriculture. The European explorers, beginning with the Spaniard Hernando de Soto in 1540, found several groups of Indian peoples in Tennessee, the most powerful of whom were the Cherokee, who succeeded in driving the other Indians out of the state by the early part of the 18th century. The name Tennessee derives from that of the Cherokee village Tanasi. The Cherokee developed warm relations with English traders from Virginia and South Carolina and were initially their allies in the French and Indian War of the 1750s. As English traders and hunters became land-hungry settlers, the Cherokee came to see them as a threat. Thus began a long period of intermittent conflict,

which ended with the final removal of the Cherokee from the state in 1838–39.

As for the English settlers, a group in upper East Tennessee, learning that they were not under royal authority, set a precedent for self-government in the Watauga Association in 1772, the example of which was later followed by the signers of the Cumberland Compact on the site of Nashville. An important group of Tennesseans showed their support for independence during the American Revolution by contributing to the defeat of the Tories in the Battle of Kings Mountain in South Carolina in 1780. This was one of several encounters that encouraged British leaders to withdraw their forces.

At first a part of the new state of North Carolina, Tennessee made a bid for admission as "the state of Franklin." Because North Carolina had rescinded its original cession of western lands, however, the Continental Congress turned down this petition for statehood. Under the new federal Constitution, the region was organized as the Territory South of the River Ohio. In 1796 Tennessee became a state, the first admitted from territorial status.

The Jackson era. With the coming of the War of 1812, Tennesseans played a decisive role as volunteers under the leadership of General Andrew Jackson, whose victory at New Orleans discouraged the British from renewing hostilities. While the Democrat Jackson, elected president in 1828 and 1832, became the hero of the common man, he was opposed in Tennessee, as in other parts of the country, by the growing commercial faction. His champion in the U.S. House of Representatives, Tennessean James K. Polk, was elected president in 1844 although the majority of Tennesseans, sympathetic to the commercially oriented Whig Party, voted against him.

The Civil War and Reconstruction. As the Civil War approached, the majority of Tennesseans remained loyal to the Union, until Lincoln's call for volunteers indicated that he would hold the Union together by force. Then Tennessee, like other states in the upper South, voted for secession. Only Virginia was the scene of more fighting during the Civil War. Names such as Fort Donelson, Shiloh, Stones River, Chattanooga, Knoxville, Franklin, and Nashville evoke images of extreme sacrifice, both Union and Confederate.

While Middle and West Tennessee were sympathetic to the South, the majority of East Tennesseans remained loyal to the Union. This turmoil was reflected in the career of Andrew Johnson, popular Democratic governor and U.S. senator before the war. His loyalty to the Union during the war and his position as military governor of Tennessee subjected him to threats by many people in the state. He became a hero once again when he, as president, was impeached by a House of Representatives dominated by Radicals. (The Senate, however, fell one vote short of the majority needed to remove him from office.)

During the Reconstruction era, Tennessee provided its own Radical governor, William G. Brownlow, who expressed his hatred for former rebels in vituperative rhetoric. Radical Reconstruction lost popularity in Tennessee as it subsequently did in the North. However, former Confederates regained their rights, and blacks lost the little political power they had gained.

The modern period. Factionalism within the ascendant Democratic Party and popular crusades such as prohibition and women's rights captured public attention in the early 20th century. The preoccupation with prohibition delayed effective reform of state government until the ascendancy of Governor Austin Peay in 1922. Plagued by the Great Depression and party factionalism in the early 1930s, Tennessee resumed its reform program under Gordon Browning, who was elected governor in 1936. Prentice Cooper was the frugal but efficient governor of the wartime years. After World War II, under the leadership of governors Frank G. Clement and Buford Ellington, the state gave increased attention to education, mental health, highways, and constitutional reform, and Tennessee became a testing ground for breaking the barriers of racial segregation in schools and in other public facilities. A small minority of white extremists used violence in opposing integration. In the 1970s and '80s, with Republicans twice winning the

The Watauga Association

Andrew Johnson's career

Country music

gubernatorial chair, Tennessee once again became a two-party state. Tennesseans have been increasingly concerned with improving educational opportunities and attracting outside industry.   (S.McC.H.)

Virginia

Virginia, nicknamed the Old Dominion for its loyalty to the exiled Charles II of England during the Puritan Commonwealth, was one of the 13 original colonies. It has one of the longest continuous histories among the American states, dating from the settlement of Jamestown in 1607. It was named for Elizabeth I, the Virgin Queen, and under its original charter was granted most of the unexplored lands west of the Atlantic seaboard settlements, to the Mississippi River and beyond. The contributions of such Virginians as George Washington, Thomas Jefferson, and James Madison were crucial in the formation of the American nation, and in the early decades of the republic the state was known as the Birthplace of Presidents.

Although Virginia gave its support—including the leadership of Robert E. Lee and other generals—to the Confederacy during the Civil War, it has developed in the 20th century into a bridge state between the North and the South. Its northern counties reflect the cosmopolitan character of the national capital, Washington, D.C., which lies across the Potomac River to the north. Other areas of the state retain the tinge of conservatism developed over centuries of agricultural life and through aristocratic traditions that made the term "a Virginia gentleman" synonymous with gentility and refinement.

History and nature make Virginia a leading tourist centre. Within its borders lie many important historical monuments. They include colonial restorations and reconstructions, such as those at Williamsburg; the homes of Washington, Jefferson, and other noted Virginians; and many of the battlefields of the War of Independence and the Civil War. Although it is becoming increasingly an industrialized and urbanized state, slightly more than three-fifths of Virginia's land remains under forest cover as it descends from the mountains and valleys in the west to the beaches of the Atlantic shore. Virginia has an area of 40,767 square miles (105,587 square kilometres). It is bordered by Maryland to the northeast, North Carolina and Tennessee to the south, Kentucky to the west, and West Virginia to the northwest. The state capital is Richmond.

PHYSICAL AND HUMAN GEOGRAPHY

The land. *Relief.* Western Virginia comprises three physiographically defined mountain provinces. From west to east, they are the Appalachian Plateau, the Ridge and Valley province, and the Blue Ridge. The state's highest point, Mount Rogers, at 5,729 feet (1,746 metres) above sea level, lies in the Blue Ridge area. The Piedmont province of middle Virginia is a region of lower rolling hills, reaching from the Blue Ridge to the fall line, the place where rivers descend, often in rapids, from higher and geologically older regions onto the flatter coastal plains. The Coastal Plain province (also known as the Tidewater) lies low between the fall line and the Atlantic coast, deeply interlaced by its tidal rivers and dominated by the Northern Neck Peninsula, the Middle Peninsula, and The Peninsula (so called because of the many points of cultural interest thereon)—all west of Chesapeake Bay. East of the Chesapeake and separated from the rest of the state is the Eastern Shore, the southern tip of the Delmarva Peninsula, in which Virginia shares with Delaware and with Maryland's Eastern Shore. The Coastal Plain also contains the area south of the James River, including the Norfolk region and the 750-square-mile Great Dismal Swamp, which extends south into North Carolina.

Drainage and soils. The eight major drainage systems that empty into the Atlantic include the Potomac, which receives the waters of the north-flowing Shenandoah River at Harpers Ferry, in West Virginia, and becomes the state's border with Maryland on its way to Chesapeake Bay. The Rappahannock, York, and James rivers indent the east coast to form the main peninsulas. Two other systems pass into North Carolina, while in the extreme southwest corner of

the state two major systems flow eventually into the Gulf of Mexico. The soils of Virginia are generally fertile. In the Coastal Plain, the tidal lowlands are usually covered with loam, a mixed soil rich in organic materials. To the west, sandy loams and clays predominate. In the Piedmont, clay and limestone soils dominate, and limestone soils are found in the valley areas west of the Blue Ridge.

Climate. The state's climate, generally mild and equable, varies according to elevation and proximity to Chesapeake Bay and the Atlantic. In southeastern Virginia and the Eastern Shore, January temperatures average about 40° F (4° C); July temperatures average about 78° F (26° C). These temperatures allow growing seasons of up to eight months, three months longer than those in far western Virginia. Elsewhere in the Coastal Plain and Piedmont, continental weather overcomes the eastern marine influence to produce colder winters. In the mountains, winter temperatures of 0° F (−18° C) may occur, but cool nights in summer follow daytime highs that usually stay below 90° F (32° C). Throughout the state, rainfall averages from about 32 to 44 inches (813 to 1,118 millimetres). Snowfall averages from a few inches in the southeast to about 30 inches in the mountains.

Plant and animal life. Forests of the Coastal Plain and Piedmont areas have mainly pine and some hardwood. Cover other than trees includes marsh grass in the Tidewater section, and broom sedge, crabgrass, wire grass, and cultivated crops elsewhere. The mountainous areas contain tracts of various coniferous species and hardwoods such as hickory and oak. Bluegrass and field crops generally cover nearby valleys. Wildflowers and berry bushes abound, depending on climate and soils.

At the time of European settlement of the Great Valley of Virginia (c. 1730), large herds of native bison abounded along the banks of the Shenandoah, but, as elsewhere, the bison populations were destroyed. Black bears are found in Virginia's mountains and in the Great Dismal Swamp. Common wild animals are rabbits, chipmunks, squirrels, opossums, muskrats, woodchucks, foxes, and deer. Less common are otters, beavers, mink, and wildcats. The main game birds are doves, quail, ducks, and geese; a few wild turkeys and woodcocks may be found. Scavengers include coastal sea gulls and the ubiquitous turkey buzzard. Predatory birds include a number of hawks, owls, and the scarce golden and bald eagles. There are numerous songbirds, including the cardinal, the state bird. Poisonous reptiles include rattlesnakes, copperheads, and water moccasins. Game fish and panfish abound in Virginia's inland waters and offshore. Chesapeake Bay is the world's richest marine-life estuary, noted for finfish, blue crabs, oysters, and clams. Yearly commercial and sport fishing catches indicate generally plentiful stocks of these fishes and shellfish.

The people. Nearly 80 percent of Virginia's people are of European descent. Most of the rest are black, serving as a reminder of the important role that African slaves played in the development of the state. Few of the state's residents are foreign-born, but various ethnic groups are represented, especially in the northern counties located around Washington, D.C.

Most of eastern Virginia was first settled by English settlers from the Midland and southern counties of England, especially from in and around London. During the 1700s the Welsh and the French Huguenots were prominent among the immigrants, and a large number of people of Scotch-Irish and German descent moved from Pennsylvania into the Shenandoah valley. People of Scotch-Irish and English ancestry still predominate, notably in western and southwestern counties. Over the centuries, differences in speech developed as a result of both class structure and isolation. Folk speech was largely localized, the more "cultured" or mainstream patterns attaining a wider regional usage. Virginia's main speech patterns are Southern, but population mobility has diffused the local patterns and introduced others from different parts of the United States.

When the English colonists founded Jamestown, England's first permanent settlement in the New World, American Indians lived all around them. From these Indians the colonists learned tobacco cultivation, and tobacco became the mainstay of Virginia's early agricultural econ-

omy. In larger perspective, what are now the boundaries of the Commonwealth of Virginia contained in 1607 three linguistic stocks: the Algonquian, the Iroquoian, and the Siouan. Estimates of the Algonquian population in 1607 range from 14,000 to 21,000. Today in Virginia there are only two American Indian reservations; one each for the Pamunkey tribe and the Mattaponi tribe, respectively situated along the Pamunkey River and the Mattaponi River near West Point, where these two rivers join to form the York River. Although some Native Americans live throughout the state, especially in the urban areas of Washington, D.C., Norfolk–Virginia Beach–Newport News, and Roanoke, the only other present concentration in Virginia is that of the Chickahominy Indians, clustering along the Chickahominy River through New Kent and Charles City counties to its confluence with the James River. The Pamunkey, Mattaponi, and Chickahominy are Algonquian tribes.

Blacks were first brought to Jamestown in 1619 as indentured servants. Legalized slavery was not introduced for several decades. Black slaves were the foundation of the plantation agriculture that began in the Tidewater and spread into the Piedmont. At the start of the Civil War, about half the state's population was black, a proportion that has dropped drastically since then, despite the doubling of the total number of blacks.

Urban growth   In the 20th century the greatest growth has occurred in the urban corridor, an area that stretches south from Washington, D.C., through Arlington and Alexandria to Richmond and bends southeast to the Hampton Roads area, comprising Newport News, Hampton, Norfolk, Virginia Beach, and Portsmouth. This corridor is often classified as an extension of the great population mass, or megalopolis, arcing across the northeastern United States from Boston to Washington, D.C. Other major metropolitan areas include those around Roanoke and Lynchburg, with a number of emerging metropolitan areas around Danville, Bristol, and Charlottesville.

The increase in agricultural mechanization and productivity, with an attendant decrease in acreage and number of farms, has sent both blacks and whites to the cities for their livelihood. Richmond is more than one-half black; rural Charles City county, lying in the urban corridor, is more than three-fourths black. The counties west of the Blue Ridge have mainly small, family-run farms, and the black population is small in comparison with the Piedmont and Tidewater regions.

Throughout Virginia, race relations have been less troubled than in many other parts of the nation. Despite some early concern with federal school-desegregation orders, a general atmosphere of mutual interest and moderation has developed over the years during which black and white citizens have worked together.

Bruton Parish church in Williamsburg, still active, was the established church in the colonial capital. The Anglican church, which was disestablished during the Revolution, became the Episcopal church, retaining only one-third of the population adhering to a denomination. Dissenters, primarily Presbyterians, Quakers, Baptists, and Methodists, made up the Protestant balance. Virginia continues its Protestant tradition, although there are many Roman Catholics. The largest denominations are the Southern Baptists, United Methodists, Roman Catholics, Episcopalians, and Presbyterians.

The economy. Virginia has developed a well-balanced economy far beyond its original agricultural base. Farming has dropped to approximately 1 percent of the total yearly value of the state's goods and services, surpassing only the *Mixed economy* economic contribution of commercial fishing. Virginia's economy has changed markedly toward a mixture of the old and new and the opportunity for increases in the standard of living from both private and public initiatives and cooperation.

The role of the state government in the economy is considerable in terms of the state's revenues and expenditures, its services and promotion, and its controls and enforcement of regulations through a host of agencies. Most management of the economy, however, rests in the private sector, with due regard to governmental regulations, pub-

lic needs, and stockholder pressures. The major private coalition for helping business is the strong Virginia Chamber of Commerce, with counterparts in local chambers. Also, powerful in Virginia's manufacturing sector is the Virginia Manufacturers Association. Trade associations abound in the state, from the Virginia Travel Association to the Virginia Turkey Association. Important assistance is maintained for broad business and economic development at the state level through the cooperative Department of Economic Development under the Governor's Office. Besides this department's main office in Richmond, it has regional offices in Abingdon, Staunton, and South Boston and foreign offices in Brussels and Tokyo.

There is good support for the state's economic growth in its proximity to Washington, D.C., and the consequent benefit of further research and development at many of the military and other federal installations in Virginia. The state's historical heritage and natural beauty also offer much in the way of recreation, and its excellent port facilities are among the busiest in the nation. Virginia's income per capita is the highest of the southeastern states and above the national average.

Beginning in the 1960s, Virginia's economic productivity experienced an average annual increase slightly higher than that of the United States as a whole. Manufacturing was the leading sector. The federal government remains a dominant economic presence in Virginia, being responsible for nearly one-seventh of the state's gross product. Virginia also ranks as one of the top five states in per capita distribution of federal funds. Other increasing segments have been services and trade, including tourism, and transportation and public utilities. Some improved productivity has also come from finance, insurance, and real estate services, as well as from local government and from mining. Construction has undergone a relative decline, as has farming, in its share of productivity. Commercial fishing, while very small, continues to contribute to Virginia's total productivity.

With regard to employment in Virginia, wholesale and retail trade provide the most jobs, followed by services, federal, state, and local government, and manufacturing. Others, in descending order, are construction, transportation and public utilities, financial services, farming, mining, and commercial fishing.

Following the pattern of Southern states, Virginia has a right-to-work law that forbids the all-union, or closed, shop. As a result, only a small percentage of Virginia's nonagricultural labour force is unionized. Unemployment in Virginia traditionally is comparatively low, compared with both the United States as a whole and the neighbouring states of the Southeast.

Government operations. State and local government provide about twice as many jobs in Virginia as the federal government provides directly. However, through contracts to private firms in the state, federal operations account for a significant further percentage of employment in private industry and business.

The concentration of military facilities alone in Virginia covers nearly 450 square miles, including the Pentagon. *Military installations* Numerous army installations feature training, engineering, supply, and transportation services throughout the state; and all have considerable effect on local economic conditions and employment, both military and civilian. The transportation training centre for the army is located at Fort Eustis; and nearby is historic Fort Monroe, headquarters of the Army Training and Doctrine Command and ROTC Cadet Command. Naval activities are concentrated around the Norfolk naval base, the largest U.S. Navy installation in the world. The Marine Corps installation at Quantico is a major development and education base. The U.S. Air Force and the National Aeronautics and Space Administration (NASA) have major installations in the Hampton–Newport News area. The U.S. Coast Guard has a large facility near Yorktown, as do the U.S. Naval Weapons Station and the Naval Supply Center. Military intelligence training is conducted at Camp Peary Naval Reservation near Williamsburg.

Manufacturing. Tobacco and chemical products head the list of products made in Virginia. Other nondurable

goods include food, textiles, and apparel. The leading durable goods are transportation equipment, centred on Tenneco's experienced Newport News Shipbuilding and Dry Dock Company, which is the world's largest privately owned shipyard. Other important durables include furniture, electrical equipment, and wood products.

Farming, forestry, mining, and commercial fishing. Truck farms dot the Eastern Shore and Norfolk areas. Other farms are spread throughout the state. Products include dairy products, grains and feeds, and vegetables. Tobacco, however, is still featured in the southern Piedmont; and the state's apples and peaches are famous, especially those from the huge orchards around Winchester and in the horse-breeding country of northwestern Virginia. Rockingham county in the Shenandoah valley has one of the nation's major turkey-raising operations. Virginia's major forest product is pine timber. The main commercial minerals are coal from the southwest and stone, clay, sand, and gravel from many areas. Products from Chesapeake Bay include flounder, bass, and a number of other edible fish. Additionally, large amounts of schooling menhaden sighted by aircraft spotters are seined and processed for their oil and for protein-rich fish meal. Oysters are tonged, hard and soft clams are dug and dredged, and blue crabs are trapped and netted. Offshore, large quantities of sea clams and scallops are harvested. In addition, large ocean fish, such as swordfish and tuna, are caught on baited hooks strung out on lines relatively close to the surface of the Atlantic. Some lines are as long as 50 miles. Bans on fishing in the James River downstream from Hopewell in the early 1970s because of spills of pesticide were essentially removed in 1988. Virginia and Maryland have both passed new antipollution laws for Chesapeake Bay for purposes of conservation and recreation.

Marine products

Transportation. Although there are excellent pipeline and water transportation facilities and the port of Hampton Roads is usually the leading U.S. port in foreign tonnage, Virginia's major transportation facilities are roads, railroads, and airports. Most traffic is north–south, adding to Virginia's status as a "bridge" state. Among the many scenic routes is the Colonial National Historical Parkway, connecting Jamestown, Williamsburg, and Yorktown; planned in the 1930s, this road has only two lanes. The Skyline Drive and Blue Ridge Parkway, which join at Rockfish Gap to form a continuous road following the crest of the Blue Ridge Mountains of Virginia and North Carolina, offer spectacular views and park facilities. Also striking is the 23-mile (37-kilometre) Chesapeake Bay Bridge-Tunnel linking Cape Charles on the Eastern Shore

with the vacation centre of Virginia Beach, east of Norfolk. Comprising a trestled roadway raised above the mouth of the Bay and two tunnels (under the main shipping channels), it is the nation's largest structure of its kind.

A network of commercial airports, the largest being Dulles International, Washington National, Richmond International, Norfolk International, and Patrick Henry (Newport News) International, makes air transportation easily available. A number of large transportation corporations, including CSX and Norfolk Southern, two of the world's largest railroad-based transportation companies, have their headquarters in the state.

Financial services. As banking has crossed state lines under deregulation, several Virginia-based institutions have shown strong growth in the region. Also of note is the location in Richmond of the Fifth Federal Reserve District Headquarters.

Administration and social conditions. *Government.* The Commonwealth of Virginia's constitution, of 1776, was revised for the seventh time in 1971. In it the state retains the basic powers first delineated separately in the third constitution (1851), which enumerated the organization of the executive, legislative, and judicial branches. The only elected administrative officials are the governor, the lieutenant governor, and the attorney general; each serves a four-year term, but the governor is the only one who cannot succeed himself. The General Assembly includes a 40-member Senate and a 100-member House of Delegates, which meet annually in Richmond. State and local government is structurally simple and intended to be responsive to citizens' needs and complaints. The 95 counties are governed by elected boards of supervisors. Below them are about 190 towns within the counties and some 40 chartered cities separate from county administration and governed by elected councils employing city managers.

The Democratic Party thoroughly dominated state politics from its revival in 1883 until the Republicans elected their first governor in a century, in 1969, and six of the state's 10 U.S. representatives, in 1970. In the following decades, the two parties competed closely for domination of the state's congressional delegation. The General Assembly, however, has remained substantially Democratic, and the electorate continued to show moderately conservative tendencies.

Dominance of the Democratic Party

The Virginia judicial system is relatively uncomplicated. With four levels of courts, it avoids numerous special courts and levels at which cases may be originated or appeals made. The seven judges of the Virginia Supreme Court, the highest state judicial body, are elected to staggered 12-year terms by the General Assembly. The primary work of this court includes hearing criminal and domestic appeals from the Virginia Court of Appeals and civil appeals from the circuit courts; exercising original jurisdiction over cases of habeas corpus, mandamus, and matters filed by the Judicial Inquiry and Review Commission; and developing the body of Virginia common law. After a 15-year study conducted by the Judicial Council, the General Assembly created the Virginia Court of Appeals, which began hearing cases on Jan. 1, 1985. The primary purpose of this court is to expand judicial capacity to relieve the immense backlog of criminal and domestic cases pending before the Supreme Court. There are 10 judges on this court, elected by the General Assembly to eight-year terms. The 31 judicial circuits are the courts of general jurisdiction in Virginia. Judges of these courts are elected to eight-year terms by the General Assembly. Other courts include general district (municipal and county), juvenile, and domestic-relations courts. Additionally, all judicial circuits have magistrates who have the authority to issue warrants but lack trial jurisdiction. Counties and cities have a commonwealth's attorney, whose main job is criminal prosecution.

Law enforcement is largely the responsibility of local police departments and county sheriffs. The main job of the Department of State Police is to enforce the state's highway laws.

Education. The public schools, which date as an institution from 1846, have accelerated improvements in facilities and curricula since the 1960s, and average num-

Higher
education

ber of years of education completed by Virginians has risen. The state Board of Education supervises public primary and secondary education, and the State Council of Higher Education coordinates higher public education. Virginia has a strong public community-college system, with branches throughout the state. Its four-year public and private colleges and universities are numerous. The best known are the College of William and Mary in Williamsburg, a state university founded in 1693 and the second oldest college in the nation, and the University of Virginia in Charlottesville, founded in 1819 largely as the creation of Thomas Jefferson, both in its organization and in the design of its buildings and grounds. Virginia Polytechnic Institute and State University, in Blacksburg, is a large land-grant institution. James Madison University, in Harrisonburg, was previously a state teachers' college for women. Substantial urban state universities have developed starting in the 1960s; notably George Mason University, in Fairfax; Virginia Commonwealth University, in Richmond; and Old Dominion University, in Norfolk. Well-known private Washington and Lee University and state-supported Virginia Military Institute are both located in Lexington. Hampton University, private and predominantly black, has a national reputation. Norfolk State University is the state's largest predominantly black public university. A substantial percentage of the state's many private colleges were founded by religious denominations.

Health and welfare. Private and public facilities in Virginia share in providing health care. Public services involved directly or indirectly include water and sewage, immunization, and care for crippled children and the mentally ill. Welfare and public assistance are administered in conjunction with local welfare boards and superintendents.

Cultural life. Many of Virginia's settlers and leaders were immigrants from the educated, often aristocratic, classes in England. They set the tradition of a cultural life that appears somewhat contradictory when considered against the state's long agricultural background.

The arts are an active concern of the state government, as well as of private patrons. The Virginia Museum of Fine Arts in Richmond was the first state museum of the arts when it was established in 1934. The museum also sponsors an active program in the performing arts. Using local arts groups as affiliates, it exerts a statewide influence. In addition to the Virginia Museum there is a state Commission of the Arts and Humanities.

The Barter Theatre was founded by actor Robert Porterfield in 1933 in the tiny southwestern town of Abingdon; its original charge for admission was produce, handicrafts, or whatever the prospective viewer could afford. Dozens of art galleries are located throughout Virginia. There are several ballet companies, orchestras, civic choruses, and opera and theatre companies, as well as numerous festivals of the arts.

Historical
sites

Millions of visitors annually are attracted to Virginia's historical sites. In the forefront is Colonial Williamsburg, its many restored or reconstructed 17th- and 18th-century buildings representing expert research. Striking examples of colonial architecture are found at such preserved homes as George Washington's Mount Vernon, near Washington, D.C., and Thomas Jefferson's Monticello, near Charlottesville. Civil War monuments in the state include the battlefield known to Southerners as Manassas and to Northerners as Bull Run, near Washington, D.C., and Appomattox Court House, the site of General Robert E. Lee's surrender to General Ulysses S. Grant in 1865. There are more than 100 historical societies and museums in the state and several scholarly and popular historical journals with national readership.

HISTORY

Settlement and colonial period. The purposes of the Virginia Company that landed at present-day Jamestown in May 1607 were not only to colonize but also to Christianize, to open new areas for trade, and to guard against further Spanish inroads. Hunger, poor shelter, Indian hostility, and rampant disease plagued the early years, but, while the colony tottered constantly on the brink of dissolution, a tobacco industry was begun by John Rolfe

and a representative assembly was convened. In 1624 the company's charter was revoked and Britain's first royal colony established. In the following years new settlements were made and local administrative systems were devised.

The governorship of Sir William Berkeley—begun in 1642, interrupted by Puritan rule from 1652 to 1660, and ending in 1677—marked the solidification of the colony. The many anti-Puritan cavaliers who fled to Virginia after 1649 added an important element to the population, much of which consisted of indentured white and black servants. A rebellion in 1676, led by Nathaniel Bacon, though short-lived, led to Berkeley's recall and signaled a growing restlessness for more self-government among the colonists. This sentiment became strong during the century that followed, when England attempted to govern fairly but did not allow the inhabitants of its American colonies the full rights of Englishmen at home.

This was a period of expansion as well as of internal strengthening. Settlers from the Tidewater region spilled over into the Piedmont, across the Blue Ridge, and, by the 1740s, into the Ohio country beyond, there running afoul of French ambitions for that region. For decades the popularly elected House of Burgesses led the way in opposing royal prerogatives in the colony, and, following England's prohibition of westward expansion in 1763, a concerted drive to rationalize rebellion began. On the eve of the Revolution, Virginia had more than 120,000 residents, many of them persons of considerable sophistication and learning, and a stable—if narrowly based—economy.

Independence and statehood. Virginians were among the leaders of the American Revolution and of the events leading to it, including the calling of the first Continental Congress in 1774. Thomas Jefferson was the primary author of the Declaration of Independence, while George Washington assumed command of the armies. It was at Yorktown that the British armies were forced to surrender to combined American and French forces on Oct. 19, 1781, leading to acknowledgement of the colonies' independence in the Treaty of Paris of 1783. In 1788 Virginia became the 10th state to ratify the Constitution.

Leadership
during the
Revolution

The state continued its national leadership in the following decades, furnishing four of America's first five presidents and, especially through Jefferson and James Madison, much of the intellectual ferment out of which the basic political institutions of the young nation gradually were shaped. The state had abolished the African slave trade in 1778, but slavery itself continued as the basis for the state's agricultural economy. Nat Turner's slave insurrection in Southampton county (1831) raised tensions.

(C.L.Q.)

Civil War and Reconstruction. In 1861 Virginia seceded from the Union. Richmond became the capital of the Confederacy, and Virginia was the chief battleground throughout the war. In 1863 the state lost one-third of its territory to form West Virginia. In 1867 Congress placed the South under military rule, and Virginia was not readmitted as a state of the Union until 1870.

Virginia escaped much of the punishment of Reconstruction, but it had lost thousands of its young men and had been devastated by invading armies; its banks had been closed, its currency turned into worthless paper, its labour force demoralized, and its territory occupied by its former enemy. In April 1871 it also had a prewar debt, made for internal improvements, amounting to over $45,000,000, more than one-third of which was interest accrued during the war and Reconstruction.

Strife over the state debt was the prominent feature of political life during the 1870s and '80s. When the pre-Reconstruction leaders regained control, they provided for payment of the entire debt, designating one-third as West Virginia's share, for the payment of which Virginia assumed responsibility. The bankrupt state could not meet its obligations to its citizens and pay interest to its creditors, however, and the new system of public schools, organized in 1870, suffered. Then in 1882 a group known as the Readjusters, claiming that the debt and interest needed pruning and with aid of the Republicans, seized control of the government and "readjusted" the debt. Not until 1891–92 was a satisfactory compromise settlement

reached with the creditors, and later West Virginia paid its share. The Democratic Party was revived in 1883. Virginia adopted a new constitution in 1902.

The **20th century.** In 1926 Harry F. Byrd became governor of Virginia, and he revolutionized the governmental Reforms of machinery. During the first 60 days of his administration, 1926 the General Assembly revised the tax system; reformed the fee system; initiated constitutional amendments that shortened the ballot, concentrating authority in the governor's hands; and encouraged industries to settle in the state. After World War I the state's prosperity increased as agriculture diversified, manufacturing grew in importance, and tourism became a major enterprise.

The Great Depression of the 1930s was less severe in Virginia than in many other states. In the period before U.S. entry into World War II, Virginia was the first to set up a state defense system. The war brought tens of thousands of soldiers into its military camps. The Hampton Roads area had a great boom with the expansion of the Norfolk naval base and the shipbuilding activities in Newport News. Employment continued at a high rate after the war, with continued growth in the nonagricultural sector, including government.

In presidential elections the state voted for the Republican candidate in 1928, for the first time since 1872. In 1948 the plurality of voters supported the Democratic candidate, Harry S. Truman, while the majority was split between the Republicans and Dixiecrats; and in subsequent elections the majorities were usually Republican.

In the state, political leadership continued to be exercised by former governor Byrd, who became U.S. senator by appointment in 1933 and by election in 1934, remaining in office until his retirement in 1965. Before Byrd's death in 1966 his organization was rapidly becoming more sensitive to the political, social, and economic needs and rights of all the people.

A revised constitution, effective July 1, 1971, did not change the fundamental structure of the state. It deleted outmoded and nonfundamental sections and added provisions responding to the requirements of modern conditions, such as an updated fiscal policy, annual legislative sessions, conservation and environment.

Following the U.S. Supreme Court's order in 1954 to desegregate public educational facilities, the schools of Prince Edward county gained nationwide attention by closing their doors from 1959 to 1964. Despite such events and a few sporadic outbreaks, Virginia was able to avoid much of the racial strife afflicting North and South alike and moved carefully to implement civil rights laws. The principal challenge of the late 20th century appeared to be the problems of increasing urbanization.

<div align="right">(R.L.Mo./C.L.Q.)</div>

West Virginia

West Virginia justifies in every way its nickname, the Mountain State. With an average altitude of 1,500 feet (457 metres) above sea level, it is the highest of any U.S. state east of the Mississippi River. It is a region tied economically and socially to the mountain spines that span its length and breadth and to the rivers that enclose it on many sides. The settlers of northwestern Virginia who, in 1861, defied the state's secession convention, choosing instead to remain within the Union and to form a new state, acted much in the tradition suggested by the motto of West Virginia, "Montani semper liberi" ("Mountaineers always freemen").

West Virginia, admitted to the Union as the 35th state in 1863, is a relatively small state, with an area of 24,232 square miles (62,761 square kilometres). It is bordered by Pennsylvania to the north, Maryland and Virginia to the east, Kentucky to the southwest, and Ohio to the northwest. The state capital is Charleston. In comparison with the national standards and averages of the United States, West Virginia is poor in personal incomes and The state's in overall economic development. For decades the rich image coal beds underlying most of the 55 counties made West Virginia a leading producer of bituminous coal in North America. The gnarled terrain locked West Virginians into

their small communities in the narrow valleys and posed both literal and symbolic obstacles to people from the outside world. From 1940 to 1970 and again in the 1980s large numbers of the state's population left West Virginia for places offering greater employment opportunities. The 1970s, however, marked a turning point in out-migration and the beginning of a stabilizing trend. During the 1980s population loss from the coalfields and heavy manufacturing was partially offset by an influx of urban professionals and retirees in the eastern panhandle. West Virginians have become determined to develop a more modern social and economic climate in their state.

PHYSICAL AND HUMAN GEOGRAPHY

The land. *Relief.* The maximum elevation in West Virginia is 4,861 feet (1,482 metres) at Spruce Knob in the east. The lowest land is 247 feet (75 metres) at Harpers Ferry, located on a steep tongue of land rising above the confluence of the Shenandoah and Potomac rivers. The land is rugged, ranging from hilly to mountainous, and there are no extensive expanses of level land. The state's two panhandles, one knifing northward between Pennsylvania and Ohio, the other eastward between Maryland and Virginia, provide West Virginia's alternate nickname, the Panhandle State.

All of West Virginia is a part of the Appalachian Mountain system. It is commonly subdivided, however, into two major physiographic regions: the geologically older Mountain Allegheny Plateau and the newer Appalachian, or Great regions Valley, region. These are separated by the Allegheny Front, dividing the waters that flow to the Atlantic Ocean from those flowing to the Gulf of Mexico. The Allegheny Plateau covers the western two-thirds of the state and coincides with the Ohio River drainage basin. It is a region severely dissected by streams into a maze of hills and valleys, and, in places, the original plateau surface shows as the uniform top levels of the remaining ranges. The northeastern portion of the Allegheny Plateau near the Pennsylvania border, with the highest mountains of the state, is sometimes referred to as the Allegheny Mountains. More than 40 of these mountains stand in excess of 4,000 feet, inducing heavy precipitation in the area and making it the wettest in the state and the source of many of its rivers. The eastern edge of the state and the eastern panhandle comprise the second region. This geologic province takes

<div align="right">B Thomas—H Armstrong Roberts, Inc</div>

Rugged terrain of the Allegheny Plateau in the Dolly Sods Wilderness area of the Monongahela National Forest, West Virginia.

in most of the Potomac River basin and is famous for its northeast–southwest folded mountain alignment, part of the chain reaching from Canada to central Alabama. The northern end of the Blue Ridge Mountains forms a minor region in the easternmost end of the panhandle.

Drainage and soils.   The pattern of drainage east of the Allegheny Front features a short, trellised drainage system flowing toward the northeast and ultimately draining into the Potomac. The western portions drain across an inclined plane by a longer system that flows generally northwest into the Ohio River. A very small area drains into the eastward-bound James River system of Virginia.

Drainage over West Virginia's rugged surface has created some of the most productive and level alluvial soils on the larger river floodplains. The weathered limestone soils of the east are suited for pasture and orchards. The acid, sandstone-derived soils of most of West Virginia foster a variety of agricultural activities. Some of the clay soils along the Ohio River are bases for the ceramics industry.

Climate.   The state has distinct seasons of about equal length. It has a humid continental climate except for a marine modification in the lower panhandle. Mean annual temperatures reflecting latitude and altitude range from about 56° F (13° C) in the south to 52° F (11° C) in the north and 48° F (9° C) in the most mountainous regions. January is the coldest month, with a statewide average of 33° F (1° C), and July is warmest, with a 73° F (23° C) average. The growing season averages 160 days but ranges from 120 to 180 days. Mean annual precipitation varies from more than 60 inches (1,520 millimetres) in the mountainous areas to 35 inches in the eastern panhandle. Snowfall, which makes up some 8 percent of the total precipitation, varies from a seasonal average of less than 20 inches in the southwest to more than 64 inches in the northern mountains.

Plant and animal life.   Forests cover about 75 percent of the state. Accessible virgin forests were harvested by the turn of the 20th century, but successional forests are now established except in agricultural and urban concentrations. The plateau forests consist of hardwoods of red and white oak, yellow poplar, sugar and red maple, hickory, beech, basswood, black cherry, and yellow birch. Softwoods of loblolly pine, shortleaf and white pine, spruce, and hemlock cover the mountain slopes, deep gorges, and other scattered areas. The eastern section is predominantly an oak and pine woodland. Other species such as the sycamore, locust, chestnut, elm, and dogwood are common.

Rabbits, squirrels, gray foxes, opossums, skunks, raccoon, and groundhogs are common in West Virginia. The larger white-tailed deer found in abundance by the settlers is numerically increasing in the remote and protected areas, and black bears are found in the isolated high country. Mountain streams feature trout, bass, pike, and muskellunge, while the improving water quality of the larger rivers accommodates increasing numbers of perch, bluegills, catfish, and other species.

Urban and rural patterns

Settlement patterns.   Broad, level ridge tops and valley bottoms are commonly cleared for agriculture and living. The field patterns are usually linear, in conformity with the landscape. Rural dwellings are distributed as ribbons of settlement along the highways or near other transportation systems. Many rural dwellers commute to urban areas for employment because of the decline in agriculture and the mechanization of mining.

West Virginia has a number of cities with populations of more than 20,000. Of these, Huntington, Wheeling, Parkersburg, and Weirton are situated on the Ohio River, where water and rail transport and room for expansion have permitted growth. Most urban development and industrial growth extend along other streams, as in the Kanawha and Monongahela valleys. The larger cities, with their industrial concentrations, their political importance, and their colleges and universities, dominate the state's activities. County seats of government in the rural regions exert considerable influence over the areas they serve.

The people.   The first pioneer settlement in what became West Virginia was by Germans along the Potomac River at Shepherdstown. Later German settlements were too scattered to establish patterns within the area. The 1790 census reported 55,873 inhabitants, of whom about 15,000 were of German descent. In the early 1800s many orders of the Virginia government relating to the frontier occupants were printed in both German and English. English descendants dominated the settlement of the Greenbrier, New, Kanawha, and Monongahela valleys, while Scotch-Irish tended to settle in the less accessible areas. Americans of African descent shared in this early heritage, although the number of slaves in western Virginia was limited since the rugged topography curtailed extensive agriculture. Only two counties, Jefferson and Kanawha, ever had more than 2,000 slaves, and in one-third of the counties slaves constituted less than 1 percent of the population. After the Civil War the development of railroads, mining, and industry attracted many blacks from the South as well as numerous labourers from southern Europe. The contrasting cultural influence of these more recent immigrants is apparent in the industrial northern panhandle and in the towns dominated by coal mining.

Later immigrants

The Quaker and Presbyterian denominations were established by the 1730s, with Baptists entering Berkeley county in the eastern panhandle in 1743. A Methodist circuit was established in Berkeley and Jefferson counties in 1778. Leading denominations in West Virginia are Methodist, Baptist, and Presbyterian. Roman Catholic and Lutheran adherents were prevalent in the early years of West Virginia, but they were limited primarily to the German settlements. Expansion of these faiths, particularly of Roman Catholicism, occurred with the immigration of Irish, German, Italian, Polish, and Hungarian labourers.

The economy.   West Virginia has traditionally maintained a poor economic position among the states. A number of major factors caused the large migration out of the state during the 1950s and '60s. After 1950 mine mechanization and declining coal use contributed to a decreasing demand for labour. Rugged land and limited farm size hampered mechanization of agriculture, and the competitive advantage shifted to states with more level and expansive land. Foreign competition in the glass and ceramics industry also reduced economic opportunity. Some industries neglected to make progressive changes or could not create space for expansion, and the increasingly obsolete facilities hampered competition.

During the 1970s, resurgence of coal as a major energy resource and progressive government efforts to improve social and economic conditions in the region reversed the migration flow. The chemical, steel, and glass industries were modernized, and new high-technology industries were established in the Ohio and Kanawha valleys. These factors brought about migration within the state from poorer agricultural and mining regions to the urban areas, where better employment and educational opportunities exist.

In the 1980s, numerous jobs in the coal industry were lost, and the cyclical nature of mining created pockets of poverty in the state. Employment declined also in the manufacturing and chemical-processing industries. These job losses resulted in an out-migration among the young, with the oldest age groups tending to remain fixed. With this movement, the state began placing a greater emphasis on a more diverse economy, with a large service sector. The Governor's Office of Community and Industrial Development, established by the West Virginia Economic Development Act of 1985, has initiated successful action in three areas: strengthening the state's industrial base, directing marketing efforts to those concerns that will enjoy a comparative advantage by operating in the state, and creating an environment that encourages entrepreneurship and fosters the growth of small business.

Resources.   West Virginia has an abundance and variety of natural resources. The vital mineral is bituminous coal. Natural gas dominates the state's west central portion. Petroleum is extracted in the northern two-thirds of the gas-producing areas. Coal and extensive deposits of rock salt and brine have been supportive of a chemical industry. Abundant sand and clay distributions are basic to glass, tile, and brick production. Limestone is common in the eastern quarter.

The natural-resources development has influenced indus-

Coal deposits

trial location and greatly affected the economy of certain areas. Industrial cities of the Ohio, Kanawha, and Monongahela valleys are dependent on local coal, limestone, clay, salt, glass sands, oil, and natural gas, as well as on the ready availability of water.

Agriculture and forestry. West Virginia has enormous stands of high-quality hardwood forests. Wisely used, this renewable resource is recognized as a safeguard against floods, slope erosion, and air pollution. It is significant to the state's tourist industry, to the thousands of workers in timber production, and to the manufacturing of finished wood products.

The rugged terrain of the state limits agriculture. Since the 1950s there has been a decline in acreage harvested and in the value of most crops per acre. But West Virginia ranks well within the upper one-third of the states in apple, peach, and tobacco production.

Industry. Since the late 1970s the nonmetallic mining industry has been in decline, and only large operators have prospered. Severe cutbacks in steel and other heavy industries have been moderated by state aid and concessions from workers' unions. Thermal electricity plants have expanded but at a slower rate because of the drift from energy-intensive heavy manufacturing to light manufacturing and the service sector. With a renewed emphasis on tourism, related services have prospered.

Transportation. The larger cities and the state's perimeters are well served by transportation facilities. The rugged terrain of West Virginia limited early transportation and contributed to isolation and slow economic growth. It is still a formidable obstacle, but remarkable progress has been made. Interstate highways that cross the state have improved internal travel and economic development. The Appalachian Highway Corridor roads have been instrumental in completing the network of other federal and state roads. The major river systems of the western plateau provide 450 miles (725 kilometres) of navigable waterway. Huntington, located at the confluence of the Ohio and Guyandotte rivers, is the state's largest port. Airline deregulation has led to an overall reduction in scheduled air carrier service. Major airlines serve Charleston and Huntington, and commuter lines have helped fill the void. Three rail companies with a strong east–west orientation provide haulage over the 3,500 miles of line.

Administration and social conditions. *Government.* West Virginia's present constitution dates from 1872, but it has been amended many times. The governor is assisted by an elected secretary of state, auditor, treasurer, attorney general, and agriculture commissioner, in addition to a superintendent of schools appointed by the state board of education. The legislature consists of the Senate and the House of Delegates. Two senators are elected from each of the 17 senatorial districts; their four-year terms are so arranged that one of them must stand for reelection every two years. The House of Delegates is composed of 100 members, each serving a two-year term. Their representation is apportioned over 40 voting districts on the basis of population. The legislature meets annually for 60 days, but the governor is empowered to convene special sessions. At the head of the judiciary division is the Supreme Court of Appeals, consisting of five judges elected to 12-year terms. The heavily burdened 31 circuit courts try the major cases. Magistrate courts serve at the county level, and municipal courts are provided for in incorporated areas.

The Department of Public Safety provides law enforcement at the state level and maintains bureaus of criminal identification, motor-vehicle inspection, and accident prevention. County law enforcement is handled by a sheriff, sheriff's deputies, and a prosecuting attorney working with county and municipal police. Under the state constitution, each county is governed by three commissioners elected for six years. Other elected county officials are sheriff, prosecuting attorney, assessor, members of the board of education, and surveyor. Some towns have a mayor–council form of government, others a council–manager form. All officials except the city manager are elected.

Education. The public school system, directed by the state board of education, is under a county-unit plan allowing local supervision under county boards. The state-controlled system of higher education includes West Virginia University at Morgantown and Marshall University at Huntington. There are, in addition, several state colleges, community colleges, specialized technical institutions, and a number of private and sectarian colleges. The Vocational, Technical and Adult Education Division provides an important educational supplement with courses in agriculture, home economics, practical nursing, and technical, industrial, and distributive skills. The National Radio Astronomy Observatory at Green Bank is a unique educational and research facility. A national centre for the reception and study of radio waves that come from space, it is open to all users and has undergone expansion.

Health and welfare. The State Department of Health has responsibility ranging from collecting statistics on various diseases and health-control matters to overseeing all matters relating to public health and medical facilities. County and municipal boards of health assist at the local level. The state also oversees public assistance programs in such areas as child welfare, distribution of commodities and food stamps, and matters regarding old age, blindness, dependent children, disability, and general relief. There are hospitals for the mentally ill and numerous programs for mentally handicapped children and adults.

Cultural life. The early isolation of West Virginia resulted in the development and transmittal of strong, self-reliant local heritage relatively unaffected by circumstances from beyond the hills. Musical instruments, ballads, and handicrafts of earlier generations are still in evidence. Numerous fairs, craft centres, and collectors have assured the permanence of this cultural past. The making and playing of dulcimers, old-time fiddle contests, ballad singing, patchwork quilting, furniture caning, and primitive drawing, along with Elizabethan speech patterns and other remnants from the past, persist in the rural regions.

In addition to the folk arts and crafts, the Huntington Museum of Art and the Sunrise Museums at Charleston have excellent cultural facilities. In local art exhibitions picturesque landscapes and townscapes of the state are shown in a majority of works, but often they indicate awareness of advanced artistic styles. The universities and colleges are cultural centres as well, fostering work in the visual arts, theatre, dance, and music.

A thriving tourist and recreation industry has developed around West Virginia's cultural heritage and its various historical and natural resources. Harpers Ferry, for decades almost a ghost town, is a national historical site. Ski slopes attract winter visitors. Plunging streams and river sites feature white-water activities and aquatic festivals. There are 33 state parks, including Pipestem State Park, in which an amphitheatre, a country store, and a craft centre are typical of installations to promote the state's heritage and to encourage the tourist industry. The resort at White Sulphur Springs is famous throughout the world.

Traditions of folk arts and craft [margin note]

HISTORY

Some 14,000 years ago Indian hunters entered the Ohio and Kanawha valleys in pursuit of mammoths. Around 9000 BC the Archaic people, with a small-game hunting, fishing, and gathering culture, occupied the area. Their successors, the Adena, or Mound Builders (*c.* 500 BC to *c.* AD 100), created numerous earthworks still visible in the Moundsville and Charleston areas. The Adena were absorbed by the Fort Ancient people, who dominated the territory until they were wiped out by the Iroquois League around 1650. Except for scattered villages the area that was to become West Virginia remained Indian hunting grounds and battlegrounds when Europeans arrived in the 1700s.

Colonial period and Virginia's dominion. The second charter of Virginia in 1609 provided for settlement of that colony's western frontiers. Exploration and trade were further encouraged by Governor William Berkeley after 1660. The Blue Ridge was reached in 1670, and in 1671 another expedition encountered the first westward-flowing stream, the New River, in southwestern Virginia. The expedition descended the river to Peter's Falls on the future Virginia–West Virginia border and claimed for England all the land drained by the New River and its tributaries. Subsequent

County and municipal government [margin note]

such factors as mountain barriers, Indian resistance, conflicting English and French claims in the Ohio valley, disputed land titles, and a royal proclamation of 1763 prohibiting occupancy.

Despite these obstacles, the population increased, and discontent with the government east of the mountains became endemic. The Vandalia colony, proposed in 1769, and the "14th State" movement for the establishment of a Westsylvania in 1776, indicate an early interest in a separate government for the Trans-Allegheny country. Dissatisfaction among the pioneers in that region mounted in the cultural, social, economic, and political realms. The frontier residents, who came from many areas, were distinctly different from the aristocratic eastern settlers. Furthermore, topographic differences rendered slavery economically unsound, and cultural heritage made it undesirable. Voting representation and taxation, however, decidedly favoured eastern Virginia.

Civil War and statehood. The advent of the American Civil War fueled new desires for a politically separate western area. At the Virginia secession convention of April 1861 a majority of the western delegates opposed secession. In subsequent meetings at Wheeling (May 1861), dominated by the western delegates, the ordinance of secession was declared an illegal attempt to overthrow the federal government. The second Wheeling convention (June) pronounced the Richmond government void, established a restored Government of Virginia, and provided for the election of new state officers. The restored governor, Francis H. Pierpont, secured federal recognition and maintained civil jurisdiction over the region until Congress consented to the admission of West Virginia to the Union on June 20, 1863. A condition of entry was the

(margin note) Separatist sentiment

gradual emancipation of slaves in the region. The capital was permanently established at Charleston in 1885.

Civil War engagements were few in the state, although the war itself was in part precipitated by the seizure of the federal armory at Harpers Ferry in 1859 by a small band of men under the antislavery zeal of John Brown. Brown was captured by federal troops and subsequently was tried and hanged in Charles Town, but his exploits inflamed tensions between the nation's proslavery and antislavery factions. To the abolitionists of the North he became a martyr. During the Civil War nearly 32,000 soldiers enlisted in the Union army, and about 9,000 served the Confederacy, although some authorities maintain the latter figure to be low.

The modern period. West Virginia's industrial emergence, encouraged by railroad expansion, began in the 1870s. Its natural resources of timber, coal, salt, oil, and gas substantially contributed to the establishment of the modern industrial system of the United States. The labour troubles that flared in mining areas between 1912 and 1921 required the intervention of the National Guard (twice) and the U.S. Army (four times) to quell violence, but the right to organize labour unions, which was granted by national statutes in 1933 and 1935, brought a measure of peace to the state. West Virginia was one of the leading states in the percentage of its population serving in World War II, Korea, and Vietnam. The state received national political recognition in 1976 and 1980 by the election of a New York City native, John D. Rockefeller IV, to the governor's office. In 1984 he was elected to the U.S. Senate. Neither national political party has dominated the state for long periods, although the Democrats have tended to outnumber Republicans and usually had more than twice the number of registered voters.   (S.E.C.)

(margin note) Industrial development

THE MIDWEST

Illinois

Admitted as the 21st member of the Union on Dec. 3, 1818, Illinois has throughout the 20th century been profoundly divided. It lies within both the so-called old industrial belt and the fertile agricultural heart of the nation. The presence of Chicago, the nation's third largest city, creates sharp distinctions between the state's largely urban northeast and the more evenly balanced urban–rural population downstate. Because of its great length, Illinois exhibits both Northern and Southern regional characteristics. Still further contrasts derive from the racial and ethnic complexity of the population.

These internal divisions, while not unique to Illinois, perhaps became magnified through the state's critical role in the economic and political life of the nation. Rich in coal and oil reserves and ideally located for the acquisition of raw materials and distribution of finished goods, Illinois ranks among the top states in value of exports, agricultural income, and value added by manufacturing. Chicago is a railroad hub of the nation; its O'Hare International Airport is among the world's busiest, and Illinois highways and waterways are thick with commercial traffic. Politically, Illinois has continued to be a "swing state," its votes often mirroring fluctuating social tensions that underlie the growing, but unevenly distributed, economic prosperity.

Illinois encompasses 56,345 square miles (145,934 square kilometres) and stretches 385 miles (620 kilometres) from Wisconsin in the north to Cairo in the area that is known as "Little Egypt," which lies farther south than Richmond, Va. In addition to Wisconsin, the state borders Lake Michigan on the northeast, Indiana on the east, Kentucky on the southeast, and Missouri and Iowa on the west. Illinois was named for the Illinois Indians. The capital is Springfield.

PHYSICAL AND HUMAN GEOGRAPHY

The land. *Relief and drainage.* Illinois is drained by as many as 900 streams emptying mostly into the Mississippi

(margin note) Transportation centre

River system. The Chicago and Calumet rivers, originally flowing into the St. Lawrence by way of Lake Michigan, have been altered through the construction of canals to drain into the Mississippi by way of the Illinois River. The Ohio River joins the Mississippi at the state's southern tip.

Flat prairies cover much of Illinois, with irregular plains in the western, northern, and southern sections. The unglaciated southernmost part of the state is in many ways out of character with the rest of Illinois. Shawnee National Forest, the only federal forest in Illinois, covers a great part of this region. Southern Illinois consists of gently sloping, open hills. Rolling hills in the northwest include the state's highest point, 1,235 feet (376 metres) above sea level. The statewide average elevation is about 600 feet. Water lies under all of Illinois in natural underground reservoirs. Chicago and many of its suburbs draw their water from Lake Michigan, but most of northern Illinois's water is pumped from underground wells. Some regions face a dwindling water supply; around Joliet the water table has been lowered more than 700 feet in the past 100 years. Most of the state's lakes are man-made.

The deep black soil of much of northern and central Illinois has unusual richness, and its quality for agriculture is among the finest in the world. The soils of the southern third of the state are far less suited for farming.

Climate. Because of its geographic position and its long north–south axis, Illinois experiences wide seasonal and regional variations in temperature, with typically cold, snowy winters and hot summers; extremes are somewhat ameliorated around Lake Michigan. Mean winter temperatures are about 22° F ($-6°$ C) in the north and 37° F (3° C) in the south; summer equivalents are 74° F (23° C) and 80° F (27° C). Mean annual precipitation in the north is about 34 inches (864 millimetres) and in the south, 46 inches. The growing season varies from 205 days in the south to 155 days in the northernmost counties.

Plant and animal life. Illinois vegetation is separated into the Fayette prairie of northern and central Illinois and the oak–hickory forest of the western and southern regions. Before white settlers moved in, oak–hickory forests

prevailed also in the north. The settlers' needs for fuel and construction material and the lumbering industry stripped most of the trees, leaving only 10 percent of the forests in Illinois. Some 4,000,000 acres of forests remain, more than 700,000 of them in the Shawnee National Forest. The state's length gives it an unusual variety of Northern and Southern plant life. Both Northern and Southern wildflowers grow in Illinois, as do a variety of trees, such as white pine, tamarack, walnut, cypress, and tupelo gum.

Before 1800 wildlife in abundance roamed the prairies and forests, but the bison, bear, wolf, mountain lion, and elk have disappeared. Deer became extinct in 1910, but in 1933 the Department of Conservation placed small herds that resulted in a growing deer population. Game birds such as quail and pheasant are not as plentiful as in previous years, but waterfowl are abundant during spring and fall migration. Pollution has nearly wiped out many species of fish, but bullheads, carp, and catfish still abound.

Settlement patterns. Aside from the aforementioned distinction between the Chicago area and downstate derived from population patterns, Illinois can be separated into three broad regions that differ markedly in their economic and social characteristics. A highly urbanized band—with extensive farming areas in between—reaches across the state in the north from Chicago to the Rock Island–Moline complex on the Mississippi and includes Kankakee, Joliet, and Rockford. Most of the farmland, although decidedly rural, has easy access to a sizable urban centre. The region is characterized by heavy industry around Chicago and the other large centres with a large and rapidly expanding suburban complex of shopping centres, single-family dwellings, and apartment houses.

The central third of the state includes the cities of Springfield, Bloomington, Peoria, Champaign, Danville, Galesburg, Quincy, and Decatur. The economic base of the region is agriculture. Some cities (notably Peoria) support such industries as the manufacture of farm machinery and construction equipment; others are centred on institutions such as the state government complex in Springfield and the University of Illinois in Champaign–Urbana. The focus of communications and transportation is scattered among four or five metropolitan areas. The character of the people tends to remain rural or small-town, with a highly developed sense of tradition and history.

St. Louis, Mo., dominates southern Illinois. East St. Louis, Belleville, Alton, and Granite City are medium-sized cities, but they are located in only two counties, leaving the rest mostly rural. Because this region of Illinois was settled earliest, most of its communities have longer historical traditions than do their northern neighbours. Southern Illinois has coal mines, oil wells, and the Shawnee National Forest, which covers parts of 10 counties. The region is Southern mountain in character, and the pace of living is slower because of fewer cities and a depressed economy. Southern Illinois University in Carbondale has provided economic and cultural stimulation to the region.

The people. After most of the French had left Illinois following the French and Indian War, English settlers and colonists of Anglo-Saxon stock from Virginia, Tennessee, and Kentucky moved in. New Englanders and New Yorkers arrived by way of the Great Lakes or the National Road. When the United States experienced the great waves of European immigrants beginning in the 1840s, large numbers of Germans and Irish went to northern Illinois; and, from the 1880s until World War I, immigrants came from Poland, Hungary, Italy, Norway, Sweden, Austria, and Russia. In 1910 Germans ranked first in number among the foreign-born and Austrians and Hungarians second, followed by Russians, Scandinavians, Irish, and Italians. Although the Jewish population had become well established in the 19th century, its numbers swelled prior to World War II, particularly in the Chicago area. Following the war, whites from Appalachia and American Indians sought employment in the cities. More-recent immigrants have tended to come from diverse origins, with Asians and Latin Americans constituting increasingly influential sectors of the population.

Blacks have lived in Illinois since the first slaves were imported in 1719, but their numbers remained low until

the Civil War. In 1870, blacks numbered 29,000, and, by 1910, migrant blacks had settled in the southern counties and totaled 109,000. With World War I there began a steady flow of blacks to the major industrial centres, and by the late 20th century blacks in Illinois made up about 15 percent of the state's population, four-fifths of them in Chicago and Cook county.

The religious diversity in Illinois is reflected in the different origins of the people themselves. In the early 1800s Methodist circuit riders nourished tiny congregations throughout Illinois, and Methodists remain strong today. The Irish, some Germans, and later southern and eastern Europeans brought the Roman Catholic faith to the larger cities, and the Roman Catholic archdiocese of Chicago is the nation's second largest in membership. Also serving the city are scores of Eastern Orthodox and Protestant churches and Jewish synagogues.

Illinois has population characteristics similar to those of the nation as a whole: cities continue to lose whites to suburban areas, while both the number and percentage of blacks within the larger cities have increased.

The economy. The diversified nature of this economy—strength in manufacturing, agriculture, finance, mining, transportation, government, and services—makes Illinois a microcosm of the national economy. This diversity generally provides greater stability at times when other states with more narrowly based industries suffer.

The state and private business organizations give considerable attention to expanding Illinois's balanced economy. The Illinois Department of Commerce and Community Affairs has offices in foreign cities to stimulate the importation of Illinois products. The state offers services for the development of business enterprises by blacks and other ethnic minorities and disseminates information to private enterprises on new technological developments. Private organizations have played a significant part in attracting industry, in the development or rehabilitation of downtown areas, and in technological advancement.

Trade unions are strong in Illinois, both politically and economically, but neither they nor employer groups are strong enough to impose their will on the other. Mediation in labour–management disputes by politicians is a frequent occurrence, notably in Chicago, where union ties to political parties and leaders are accepted facts of life.

Resources. Illinois ranks second in the United States in reserves of coal overall and first in reserves of bituminous coal. Although Illinois is not the nation's leading coal producer, coal is the state's leading mineral commodity in value. Peak petroleum production was reached in 1940 and has declined since. Illinois leads in the mining of fluorspar, tripoli, and industrial sand.

Coal and oil dominate in the production of electrical power, but atomic energy plants have assumed increasing shares of the state's needs. Illinois has 12 such plants, more than any other state. The Argonne National Laboratory, near Lemont, and the Fermi National Accelerator Laboratory, in Batavia, are major research and development installations of the U.S. Department of Energy.

Industry. Illinois ranks high among the states in the manufacture of fabricated metals, food products, rubber products, and electrical machinery, as well as in its number of printing and publishing establishments. It is also among the top producers of nonelectrical machinery, which accounts for the largest share of its foreign exports. Industrial parks are scattered throughout the state, the greatest concentration being in the Chicago metropolitan area.

Agriculture. Illinois's greatest natural resource is its rich, black soil. Farms cover more than 80 percent of the state's area. Long the nation's major soybean producer, Illinois from year to year trades places with Iowa for first-place rank in corn. Illinois is also noted for pork and dairy products, grains, and meat animals. Family-owned farms account for the greatest percentage of farms in Illinois.

Finance. A state prohibition against branch banking has caused a proliferation of independent banks in Illinois. This issue long has produced complex political battles in Springfield, with frequent charges and occasional exposures of political graft connected with it. Observers see opposition to change coming primarily from small banks

Left margin notes:

Grant Heilman/Grant Heilman Photography

downstate that fear elimination by the huge Chicago banks and from the currency exchanges that operate with high service charges, especially in inner-city areas that cannot support an independent banking institution.

In addition to its banking strength, Illinois is a major insurance centre. Chicago is the seat of the seventh district of the Federal Reserve Bank as well as of the Midwest Stock Exchange and the Chicago Board of Trade. Although well below the New York and American exchanges in volume, the Midwest Stock Exchange experiences considerable trading. The Board of Trade is the nation's oldest and largest commodity market, dealing in contracts for grains, soybeans and their products, silver, plywood and lumber, livestock, and dairy products. Other exchanges include the Chicago Mercantile Exchange.

Transportation. Illinois is known as the transportation centre of the United States. Few comparable areas are served by so many means of transportation. The state's rail network, radiating from Chicago, is among the most extensive in the nation. Chicago is a major centre for Amtrak service and also maintains an extensive commuter rail service. Chicago is one of the principal hubs of the national road system, and nearly all of the state's major urban areas are served by at least one interstate highway. Water transportation became more efficient when Lake Michigan was connected to the Mississippi River in 1848 by means of the Illinois and Michigan Canal, linking the Chicago and Illinois rivers. The St. Lawrence Seaway stimulated the expansion of the Port of Chicago. Oceangoing freighters dock at Calumet Harbor in South Chicago. Chicago has two major airports, O'Hare International and Midway; a third, Meigs Field, on the lakefront, served small planes but was closed in 2003. More than 700 airports are located throughout the state.

Administration and social conditions. *Government.* The first state constitution was adopted in 1818, a second in 1848, and a third in 1870, which was to remain in effect for 100 years. The constitution adopted in December 1970 added new concepts to the Illinois Bill of Rights, forbidding discrimination on the basis of race, creed, colour, national ancestry, or sex in employment or in the sale or rental of property and discrimination against the physically or mentally disabled.

The executive branch consists of the governor, lieutenant governor, secretary of state, attorney general, treasurer, and comptroller, all elected to unlimited four-year terms.

Major provisions of the 1970 constitution

Under the new constitution the governor was granted powers to reorganize state government, and the governor's veto power was augmented by the authority to reduce appropriations and to object to certain portions of legislation without having to veto an entire act.

Illinois's General Assembly comprises a 59-member Senate and a 118-member House of Representatives. Senators serve four-year terms and representatives two-year terms. In 1980 a referendum abolished the unique electoral framework of the House of Representatives, under which each district elected three representatives, with the district's minority party virtually assured of one seat; representatives are now elected from single-member districts.

The judiciary is headed by the seven-member Supreme Court, whose justices serve 10-year terms. There are also Appellate Courts, Circuit Courts, and the Court of Claims, which hears claims involving the state. Although widespread support has been voiced for adoption of the Missouri Plan, under which judicial candidates and incumbent judges are reviewed by nonpartisan boards and then appointed by the governor, the partisan election of judges continues. Judges run for retention on their record, the voter designating "yes" or "no."

Illinois has three levels of local government—county, township, and municipality—plus many special districts. Counties are classed as township and nontownship, with Cook county, containing Chicago and most of its major suburbs, in a class by itself. All counties elect a number of administrative officials. The 85 township counties are governed by boards of commissioners elected from districts or at large, the 17 nontownship counties by three-member boards elected at large, and Cook county by a 17-member board elected from districts.

Townships act primarily as road-maintenance and general-assistance units. The annual town meeting, a gathering of all qualified voters, is still a feature of local government remaining from earlier centuries. Municipal government usually is of the mayor–council type, though other forms are permitted; villages utilize a president–trustee system.

Overall, Illinois has more than 6,400 units of local government, resulting in overlapping administrative, educational, park, fire, sanitary, sewage, drainage, and other special districts. Most were formed to circumvent restrictions in the old constitution but have become self-perpetuating. Patterns of taxation are similarly mixed. State taxes include those on personal and business income, cigarettes, liquor, and retail sales. Real-estate taxes contribute the major local support for schools and other services, though the state supplies "no-strings-attached" grants to municipalities and counties from income-tax revenues.

Education. The Illinois State Board of Education was created in 1975 after the 1970 constitution directed that responsibilities for public elementary and secondary education be transferred from an elected superintendent to an appointed board of citizens. The board's nine members are appointed by the governor with the consent of the Senate. The issue of funding Chicago schools long has been a bitter point of city–state contention.

In the field of higher education, Illinois offers a wide array of opportunity and is often cited for academic excellence. The University of Chicago (chartered 1890) is respected as among the finest institutions of higher learning in the nation. Northwestern University (1851), in Evanston, has a distinguished faculty in several areas, as do the Illinois Institute of Technology, in Chicago, and Southern Illinois University, in Carbondale and Edwardsville. In addition to the last-named institution, the state system includes eight state universities as well as the University of Illinois, with campuses at Champaign–Urbana and Chicago, and more than 50 community colleges. Sectarian and nonaffiliated private colleges are scattered throughout the state.

Institutions of higher learning

Health and welfare. Health and welfare assistance and services are provided by both state and local government, most of which receive funds from diverse federal agencies, although representatives of the low-income groups most requiring the services have been in frequent conflict with local officials over the question of who is to administer the funds and the programs.

Chicago's public housing is primarily a municipal re-

sponsibility, with federal aid. Both the former Model Cities Program, funded by the federal government, and the Chicago Housing Authority have met with opposition to proposals to locate public housing in predominantly white neighbourhoods. Welfare assistance to poor families, dependent children, and other groups has met resistance in the legislature in Springfield, whereas independent attempts to establish free neighbourhood medical clinics in low-income black and Spanish-speaking areas of cities have encountered local hostility and lack of adequate funding.

Thus, although medical facilities throughout most of Illinois are among the finest in the nation, and Chicago is a centre for medical and psychiatric services and training, many Illinoisans are served inadequately. And, despite the fact that income per capita in Illinois is among the highest in the nation, the burdens of public assistance seem far from solution or even agreement on goals.

Effects of Chicago

Cultural life. Inevitably the influence of a major artistic centre tends to dominate the cultural reputation of Illinois. By 1900, Chicago architects were designing commercial and private buildings that became models for modern architecture throughout the world. In the 1910s and '20s the city was a hub of literary activity, and today the holdings of its public and private institutional libraries are enormous. Its Art Institute, Museum of Science and Industry, Field Museum of Natural History, and other civic landmarks have collections and research facilities among the most complete in the world. Before the development of Hollywood around 1910, Chicago was the centre of the American film industry, and today its theatrical community offers a broad spectrum of standard and avant-garde works. Dance is widely available, and its symphony orchestra and opera company are among the premier American musical organizations.

Communities outside the Chicago area have thriving cultural lives as well, often revolving around the theatre, music, art, or various science departments of the many colleges and universities or around community theatre or musical organizations. Belleville boasts the second oldest symphony orchestra in the nation, founded in 1867. The Eagle's Nest Art Colony, founded in Oregon in 1898 by the sculptor Lorado Taft, included many well-known Illinois artists; it was acquired by Northern Illinois University in 1950. The Illinois Arts Council was created by the state in 1965 as the primary agency to fund statewide or local programs in the several arts. It is supported by the state and the National Endowment for the Arts, a federal agency.

Points of historical importance dot the state. Among old cities on the Mississippi are Galena, which preserves the home of President Ulysses S. Grant, and Nauvoo, founded in 1839 by the Mormons and their point of departure in 1846 on the trek that took them to Utah. New Salem, near Springfield, is a preservation of the community of log cabins in which Abraham Lincoln spent much of his young manhood. Throughout central Illinois the Lincoln Trail joins places associated with the president, including his home in Springfield and the sites of his debates with Senator Stephen A. Douglas. The Spoon River Trail in north central Illinois leads through the country made famous by the poet Edgar Lee Masters. Scenic areas include the Mississippi Palisades State Park and Apple River Canyon State Park in the northwest, Starved Rock State Park in north central Illinois, and the forests of the south. Oak Park, home of the pioneer modern architect Frank Lloyd Wright, contains much of his early work.

Among Illinois's finest recreational offerings are the sandy beaches of Lake Michigan, from Chicago to the Wisconsin border, and the forest preserves. Although Illinois has virtually no wilderness areas, many camping sites are located throughout the state, and boating and fishing are avidly pursued on the state's many lakes and streams.

News-papers and the broadcast media

About 70 daily and 700 weekly newspapers are published throughout Illinois. The largest of these papers, the *Chicago Tribune,* became a nationally recognized symbol of the political and social conservatism of the Midwest under the long reign of publisher Robert R. McCormick, and it continues to have wide distribution throughout the Midwest. Its point of view is offset somewhat by the *Chicago Sun-Times,* the second largest daily in Chicago.

The *Chicago Daily Defender* is published primarily for the black community. Southern Illinois is influenced also by newspapers and broadcasts from St. Louis.

Chicago is the third largest publishing centre in the nation, exceeded only by New York City and San Francisco. Much of its publishing is specialized in the areas of education, encyclopaedias, medicine, and business.

Archaeologists have found evidence dating from around 8000 BC of a Paleo-Indian culture in southern Illinois. The Mississippian people, whose religious centre was Cahokia in southwestern Illinois, constituted probably the largest pre-Columbian (around AD 1300) community north of Mexico in the Mississippi floodplain. Indian tribes in Illinois were all of the Algonquian stock. The Kickapoo, Sac, and Fox roamed in the north; the Potawatomi, Ottawa, and Ojibwa (Chippewa) dominated the Lake Michigan area; the Kaskaska, Illinois, and Peoria stalked the central prairies; and the Cahokia and Tamaroa roamed the south.

Settlement. The first Europeans to visit Illinois were the French explorers Louis Jolliet and Jacques Marquette in 1673, when they explored the Mississippi and Illinois rivers. Near present-day Peoria, Lasalle established the first French foothold, Fort-Crèvecoeur, and built Fort-Saint-Louis near Ottawa. After the French and Indian War in the 1760s, France ceded to Britain its claim to lands east of the Mississippi. The following years were uneasy—British policy was unfavourable to the area's economic development, Indians resented the British, and settlements were without civil government. By 1773 the number of settlers had declined to about 1,000 plus a few hundred slaves.

In 1778 the American capture of Kaskaskia, the British seat of government, made Illinois a county of Virginia. The first settlement on the site of Chicago was made in 1779 by the black pioneer Jean-Baptiste-Point Du Sable. On July 4, 1800, the Northwest Territory was divided, and the Illinois country was made a part of Indiana Territory; Illinois Territory was formed in 1809 by dividing Indiana Territory, and Illinois attained statehood nine years later.

Early years of statehood. In 1818, two-thirds of the population lived along the eastern and western edges of southern Illinois and primarily engaged in the fur trade. The final conflict with the Indians was the Black Hawk War in 1832.

Southern and central Illinois remained the more heavily settled areas of the state during the early 19th century. In 1848 the Illinois and Michigan Canal was completed, linking points on the Illinois River on opposite sides of the Mississippi–Lake Michigan watersheds. With rail expansion many towns became prosperous. The National Road, leading westward from Maryland and terminating at Vandalia, brought many settlers to Illinois.

Slavery as a constitutional issue

The Illinois Constitution of 1818 gave blacks the status of indentured servants, and slavery would have been legalized except for fear that such a move would prevent admission. In 1824 Illinois voters rejected a proposal for a constitutional convention whose implicit purpose was to legalize slavery. Following the heavy influx of Yankees into northern Illinois during the 1830s and '40s, which offset the Southern attitudes, abolitionist sentiment translated itself into the Constitution of 1848, which abolished slavery and forbade the importing of slaves.

When the Civil War broke out, northern Illinois remained loyal to the Union and to the Illinoisan in the White House, Abraham Lincoln. A movement to ally southern Illinois with the Confederacy failed. Some 250,-000 Illinoisans fought for the Union; among them was its most able general and a future president, Ulysses S. Grant.

Economic and social maturation. Chicago's great fire of 1871 was only a temporary deterrent in the city's progress toward becoming an industrial colossus. Its mills, rail yards, and slaughterhouses were filled with both European immigrants and freed blacks who had come to Illinois beginning in the 1860s. Until well into the 20th century, Illinois was a main focus of the American labour movement. Two events in Chicago, the Haymarket Riot of 1886 and the Pullman strike of 1894, became landmarks in the militant rise of the unions.

At the same time, Illinois was becoming a pioneer in social legislation, with a state board of health created in 1877; a compulsory school-attendance law in 1883; a "sweatshop act" providing for factory inspections and restrictions on child labour; and an eight-hour-day, 48-hour-week work limit for children, both enacted in 1893. The World's Columbian Exposition of 1893 was America's first international exhibition of the nation's vast technological and scientific strides during the 19th century.

The 20th century. During the decades up to and including the 1920s and '30s, the name Chicago became an international byword for bootleg liquor, gangsterism, and syndicate crime. Downstate Illinois was also notorious as a region of violence. "Bloody Williamson" county was the site of a feud, beginning in 1868, among five families of Tennessee and Kentucky origin. A dispute over a card game in a tavern near Carbondale grew into an eight-year vendetta fought by ambush or nighttime murder in barnyards, bars, and country stores. This violent tradition continued into the 1920s with the antiblack crusades of the Ku Klux Klan, the coal strikes, and the wars among the Shelton, Birger, and other bootleg gangs.

"Bloody Williamson" county

Amid the violence and scandals that rocked state and municipal governments in Illinois, there was tremendous economic and cultural growth. A reorganization of state government in 1917 brought more than 100 independent agencies and commissions under the governor and became a model for many other states. Chicago became America's second largest city in the 1880s, and in 1933–34 its Century of Progress Exposition drew attention again to further industrial achievement. In 1942 the world's first controlled atomic chain reaction was set off at the University of Chicago, ushering in the atomic age.

Since the Civil War, intense competition between the Republican and Democratic parties has characterized the political life of Illinois. This factor and the state's large electoral vote make it a major battleground in presidential elections. The three distinguishable political regions are Chicago, which is heavily Democratic; Chicago's suburban metropolitan area and the rich farmlands of north and central Illinois, which are strongly Republican; and southern Illinois, which may swing one way or the other. Today, the two parties have almost equal strength statewide.

Both the Democrats and the Republicans in Illinois are highly organized, from precinct to state levels. During the state's history both parties have been so frequently the target of corruption and fraud that Illinois politics has gained a checkered national reputation. From 1955 until his death in 1976, Mayor Richard J. Daley of Chicago built up enormous statewide—and nationwide—power in the Democratic Party, largely through his administrative control of all city and, effectively, Cook county departments and their patronage. If the governor is Republican, he almost always leads the party but is ordinarily unable to command the huge bloc vote possible in Chicago.

James R. Thompson, a Republican from Chicago, was first elected governor in 1976 and was reelected for four consecutive terms, a record in the history of the state. During most of that period he was faced with a Democratic-controlled House and Senate. As a result, Thompson used his extensive veto powers—including total veto, line item veto, appropriation-reduction veto, and the amendatory veto—to influence legislation.   (R.T.L./J.M.Ca./V.D.S.)

Indiana

Indiana, though officially an eastern north central state of the United States, is perhaps the most Southern in character of all Northern states. This is largely a reflection of the early settlement of the region by immigrants from the Southern hills, who brought slavery and a hearty distrust of the federal government. Indiana's 36,185 square miles (93,720 square kilometres) make it, except for Hawaii, the smallest state west of the Appalachian Mountains. The capital has been at Indianapolis since 1825, nine years after Indiana, the name generally thought to mean "land of the Indians," was admitted on Dec. 11, 1816, as the 19th state of the Union.

Indiana is a manufacturing state; its northern half lies in the mainstream of the industrial belt stretching from Pennsylvania and New York to Illinois. Many of its people, nevertheless, continue to cherish an image derived from 19th-century America: largely white, dedicated to the Protestant ethic of sobriety and hard work, oriented to the small town and medium-sized city, and interested in maintaining the prerogatives of local self-determination. It is not by coincidence that Indiana's federal aid is one of the lowest per capita of any American state or that the Indianan's nickname, the Hoosier, remains a symbol in the nation's lore for a kind of homespun wisdom, wit, and folksiness that harkens back to what is popularly regarded as a less-hurried and less-sophisticated period of history.

An overview of the state

Indiana sits, as its motto states, at "the crossroads of America." It borders Lake Michigan and the state of Michigan on the north, Ohio on the east, Kentucky on the south, and Illinois on the west, making it an integral part of the Midwest. Its northwestern cities form an industrial, economic, and social continuum with neighbouring Chicago. Their heavy black populations and black political aspirations contrast strikingly with life in the cities and towns on the Ohio River. The state is at once Northern and black, Southern and white-dominated, with all the problems attendant on both circumstances. Though generally considered a conservative and Republican stronghold, Indiana has voted into both state and national office an almost equal number of liberals and Democrats.

PHYSICAL AND HUMAN GEOGRAPHY

The land. *Relief and drainage.* Indiana forms part of the east central lowlands that slope downward from the Appalachian Mountains to the Mississippi River. Approximately five-sixths of its surface was modified by glacial action, leaving a vast quantity of excellent soil material and extensive deposits of sand and gravel. The more eroded southern part of the state gives way to the central plain, an extremely fertile agricultural belt with large farms, and then to the mostly flat glacial lake basin and moraine region of northern Indiana. The highest elevation is along the Ohio border, at 1,257 feet (383 metres) above sea level, while the low point, 320 feet (98 metres), is in the southwest where the Wabash River enters the Ohio. About 90 percent of the land lies between 500 and 1,000 feet.

Natural environment

The general slope and drainage pattern is toward the southwest, though an almost imperceptible groundswell in the northeast forms a St. Lawrence–Mississippi water divide. The Wabash, the Ohio, and the east and west forks of the White River follow this slope, forming part of the Mississippi basin. In the north the St. Joseph River meanders into Lake Michigan, while in the east the Maumee flows northeastward into Lake Erie. The northern half of the state is dotted with many small lakes, including several of the state's largest. Nearly all of the forested land is commercially owned. Among the dramatic features of the landscape are the sand dunes along Lake Michigan, most of which have been removed from the public domain by industry and private homes. This situation was remedied somewhat with the dedication in 1972 of Indiana Dunes National Lakeshore. The most scenic part of the state is the south central region around Brown county.

Climate. Indiana has four distinct seasons and a temperate climate, usually escaping extremes of cold and heat. The mean temperature in January ranges from about 37° F (3° C) in Jeffersonville on the Ohio River to 25° F (−4° C) in South Bend in the north. In July the range is from about 78° F (26° C) to 73° F (23° C) in corresponding regions, and precipitation varies from 44 inches (1,120 millimetres) in the south central region to 35 inches in the north. Snow may fall over a six-month period and averages more than 20 inches annually, with the cities along the northern border often reporting more than 100 inches. The climate of northwestern Indiana is modified greatly by its presence in the lee of Lake Michigan. Cold air passing over the warmer lake water in fall and winter induces heavy precipitation, and winter snowfall, especially, is several times greater than in other parts of the state. In addition, average daily temperatures are warmer in the fall and cooler in the spring as a result of this "lake effect." Fall is perhaps the most delightful season in Indiana,

with colours provided by maples, oaks, tulip trees (yellow poplars), and a wide assortment of other trees, whereas the spring is generally erratic and unstable. Spring is also the season of the greatest number of tornadoes, Indiana being part of a belt of Midwestern states in which the frequency of these severe storms is unusually high.

Plant and animal life. Indiana is typical of eastern north central America in its variety of trees, birds, and small game animals, and, like its neighbours, it has through the years thinned out the numbers of many of these, including the great variety of life once common to the sand dunes. Steady growth of agriculture, urban areas, and industry and the consequent pollution have taken a steady toll of natural life. Pollution of both air and water is particularly severe along the southern tip of Lake Michigan.

Settlement patterns. The three major regions of Indiana, which generally follow physiographic divisions, are: the northern region of industry and truck gardening; the fertile central plains; and the large southern region, forested and the site of caves and limestone quarries.

Industrial northwest

The nighttime skies of northwestern Indiana are alive with the belching volcanoes of its steel furnaces, and during the daytime such cities as Gary and Hammond are often darkened by clouds of smoke and airborne industrial wastes. Because of this dramatically apparent air pollution, the contamination of inland and lake waters, and the steady encroachment of industry upon the dunes and other lakefront areas since the early years of the 20th century, the area has been a national target of conservationists. Southward to the Wabash valley are rich farmlands, obtained largely by draining and deforesting marshes. To the east, South Bend is an important manufacturing city and a noted educational centre. The northeastern part of the state is more forested and pastoral, although Elkhart and Fort Wayne are major industrial cities.

Indianapolis, a city designed after Versailles, Fr., and Washington, D.C., dominates the central plains. It is a strongly conservative city whose growth has occurred largely through immigration from rural areas and annexation. A railway and highway hub, Indianapolis also serves the surrounding farming belt as packer and distributor, and it is a major industrial city as well.

The advent of industry and railroads ended southern Indiana's early dominance, which was based on the river traffic of the Ohio and Wabash. The region's major city,

Beach along the south shore of Lake Michigan in Indiana Dunes State Park, northern Indiana, with (right) the steel mills of Gary in the background.

Evansville, also serves adjacent areas of Kentucky and Illinois, and between it and Terre Haute to the north lie most of the state's oil and coal deposits. Many handsome examples of pre-Civil War architecture are found in the river towns. An old buffalo trace used by pioneers moving from Kentucky to the western prairies leads from New Albany, across the Ohio from Louisville, Ky., to the Wabash at Vincennes. Southward from Bloomington is a vast limestone belt underlain by numerous caves, which makes the state a major limestone producer. Brown county remains largely a backwoods area where log cabins abound on hillside farms.

The people. Hoosiers are predominantly white, native-born Americans of native-born parents, most of whom trace their ancestry ultimately to England, Scotland, Ireland, and Germany. Significant concentrations of ethnic minorities, however, are found in the larger metropolitan areas. Blacks constitute about 70 percent of Gary's population, 30 percent of East Chicago's, and more than 20 percent of Indianapolis'. Citizens of Polish descent form the largest white ethnic group in South Bend; and, along with Hungarian, Belgian, Italian, and Mexican groups, they are numerous throughout the north. The state's overall lack of ethnic and linguistic mix helps to account for the continuing strength of Hoosier localism.

White Protestant domination

More than two-thirds of the people of Indiana who are part of an organized religion are Protestant, a figure considerably above the national average. Roman Catholics, who make up a sizable percentage of the population in northern Indiana, are concentrated largely in the urban areas with large continental European and Irish ethnic groups, particularly South Bend. Jews constitute a small percentage of the state's population and live almost exclusively in urban centres. The Amish people constitute a small group located in the northeast, in and around Middlebury, Nappanee, and Goshen. They conduct a model farm at Amish Acres in Nappanee. Mennonites, who also live in this area, have established a college in Goshen.

About two-thirds of the state's residents live in urban areas. More than one-fifth of the people are concentrated in the Indianapolis metropolitan area, and another large percentage are in the Gary–Hammond–East Chicago complex. The national pattern of deserting the central city for the suburbs has generally occurred throughout the state, with South Bend, for example, losing population while its surrounding county has grown. Of the counties losing population, most are located in the south.

The economy. Indiana's economy is concentrated in three sectors: manufacturing, services, and retail trade. Manufacturing accounts for about one-third of all jobs in the state and generates more than 40 percent of all personal income. The availability of labour and essential materials, as well as the state's location within 800 miles (1,280 kilometres) of 40 of the nation's 50 largest consumer and industrial markets and its high rank in interstate highway mileage, have all contributed to the growth of manufacturing in Indiana. Heavy industrialization, however, has made the state's economy vulnerable to recession.

Sources of economic strength

The American Railway Union, America's first industrial (as distinct from craft) union, was founded in Terre Haute in 1893 by Eugene Debs, five-time Socialist candidate for president. The following year it was involved in the Pullman strike that brought the intervention of federal troops and Debs's imprisonment. Since then Indiana has had its share of labour strife, especially in the steel industry, but, in general, business, labour, and government work to maintain an atmosphere attractive to industry.

Resources. Indiana is a major producer of U.S. building stone, quarried in the Bedford–Bloomington region. Bituminous coal from the southwest is the state's leading source of energy for heating and generating electrical power. Natural gas must be brought in by pipelines, though during the 1880s Indiana's "Gas Belt," stretching from central Indiana south to the Ohio River, was the world's largest producing field. Few attempts were made to conserve the gas, however, and by 1898 the supply was virtually exhausted. The Indiana and Michigan Electric Company's nuclear generating station in southwestern Michigan began operation in 1975.

Agriculture. Along with forestry and fisheries, agriculture employs about 3 percent of the labour force. Technological advances have meant that, despite drops in total farm acreage and number of farms, production has increased. Indiana ranks in the top quarter nationally in cash receipts from farm marketing. Major crops include corn (maize), soybeans, and wheat, with tomatoes the principal vegetable crop. Hogs are the most numerous livestock, with cattle, sheep, and poultry also important.

Industry. Since the 1850s manufacturing has grown to be the dominant source of income for the state, with the steel industry a major component. Elkhart is well known for its production of musical instruments, and Fort Wayne produces a large proportion of the world's supply of diamond tools. Overall, Indiana ranks among the nation's top 10 states in manufacturing.

Transportation. Signs on the Indiana Toll Road proclaim the state to be the "Main Street of the Midwest," perhaps a fair estimate of its position in interstate transportation, whether by highway, waterway, air, or rail. Indianapolis is served by more major highways than any other American city, and some of the nation's largest moving companies have their headquarters there.

Responsibility for road construction and maintenance rests with city, county, state, and federal governments. County and state highway departments are subject to a patronage system whereby changes in administration bring on political dismissal and employment that result in instability in management. Nonetheless, Indiana ranks high nationally in road mileage per square mile of area, and almost all of its rural roads are paved. Though quantity may sometimes surpass quality of highway mileage, virtually all intrastate passengers and much commercial produce travel by road. Indiana has a comparatively dense network of railroad trackage. All lines running east from Chicago and St. Louis pass through the state. As in other states, however, the Amtrak system that went into operation in 1971 has sharply reduced passenger service. Commercial air service is available in major Indiana cities, and there are more than 300 public and private airports in the state.

The Ohio River, linking Indiana with the Mississippi River system, carries more low-cost freight than does the Panama Canal. The Port of Indiana harbour, on Lake Michigan about 10 miles (16 kilometres) east of Gary, was created artificially; opened in 1970, it connects Indiana with world commerce by way of the St. Lawrence Seaway.

Administration and social conditions. *Government.* Indiana's executive, legislative, and judicial structures are similar to those of other states, with some marked differences. The governor is elected for a four-year period and can serve no more than two terms in a 12-year period. Thus, gubernatorial influence on the General Assembly is often weak during the second half of an administration. The governor has veto power over legislation, but the veto can be overridden by a simple majority of the two houses. The governor's authority is wielded largely through his power to appoint and remove heads of nearly all departments, commissions, and governing boards of institutions. Several thousand jobs are subject to patronage.

The bicameral General Assembly includes 50 senators, serving four-year terms, and 100 representatives, serving for two years. They may be reelected, but there is often a high turnover. In 1970 the voters approved annual sessions for the two bodies. The state constitution requires that the legislature reapportion itself according to population every six years. This law was ignored, however, from 1923 to 1963, during which time the rural areas exerted an influence far out of proportion to their declining population. Under pressure from the U.S. Supreme Court, the state eventually achieved a reapportionment based on the "one man, one vote" principle in 1965.

The judiciary is headed by the Supreme Court, which is composed of five judges appointed by the governor and a judicial nominating commission after a screening procedure. A new judge serves for two years and then, if retained, for a term of 10 years. The Court of Appeals consists of three regional divisions with three appellate judges each and a fourth judge elected at large. There are also circuit, superior, municipal, and county courts.

The four principal types of local government are the county, township, municipality, and school district. Townships can serve a dual capacity as school and civil townships, but overall their importance has been greatly reduced; welfare is now the primary function of townships. Boards of county commissioners have executive and legislative powers, while county councils are concerned almost exclusively with fiscal affairs. City voters elect a mayor and common council. In 1969 Indianapolis merged with Marion county.

Indiana is a two-party state, the Republicans having a slight advantage since the last quarter of the 19th century, especially in control of the governor's office and the General Assembly and in presidential voting. Voting trends show about one-third of the counties to be Republican, one-third Democratic, and one-third doubtful. In 1988 Indiana elected its first Democratic governor in 20 years.

At the national level the state can claim one president, Benjamin Harrison, the grandson of William Henry Harrison, and five vice presidents. In 1940 the Indiana native son Wendell L. Willkie was the Republican candidate for president.

Education. The state's educational system is headed by a board of education and a superintendent of public instruction. Indiana ranks in the lower half of the states in outlay per pupil, although it spends about one-third of its general revenue on education. The state's elementary and secondary educational systems are good, but they are not considered to be innovative or outstanding.

In the realm of higher education, on the other hand, Indiana has made notable achievements. The three leading universities of the state are Indiana, in Bloomington; Purdue, in West Lafayette; and Notre Dame, near South Bend. Indiana University, founded in 1820, has become noted for its work in several fields, including English, foreign languages, biology, medicine, and law, and its university press rates among the nation's finest, especially in the arts. The university's School of Music has become internationally known; among its performance series are works staged annually by the Opera Theater. Purdue University, organized in 1869 as a land-grant college, is one of the nation's leading engineering and agricultural schools.

The University of Notre Dame, dating from 1842, is widely regarded as the leading Roman Catholic university of the United States. Its faculty in a dozen graduate programs has become recognized at the national level, helping to overcome its image as an institution devoted solely to athletics. Notre Dame, originally a men's school, in 1972 began enrolling women from St. Mary's College, also located near South Bend.

Health and welfare. Hoosiers as a group do not take well to the idea of supporting public welfare programs. Indiana is among the more prosperous states in the nation, but it fails to apply its wealth to public programs. For example, not until the 1970s did the average weekly unemployment benefit in Indiana exceed the national average.

In comparison with the rest of the United States, Indiana ranks near the bottom in allotment per capita for public welfare. It spends less than 10 percent of its general revenue on welfare and only slightly more than 10 percent on health care and hospitals. Indiana is well below the national average in the number of recipients of general assistance per 1,000 population. Distrust of federal programs has tended to militate against making maximum use of aid that could be available, thus necessitating continued taxes at the state and local level that are a greater burden on the aged, on those with fixed incomes, and on the working and lower-middle classes. The problem that the state confronts in financing public welfare programs is as much ideological as it is financial.

Cultural life. The fine arts flourish in most of Indiana's major cities and even in some of the smaller towns. The Indianapolis Symphony Orchestra has a respected place among the nation's orchestras, and the city also boasts the Indianapolis Museum of Art and the Civic Theater, the nation's oldest continuously operating theatre. South Bend and Fort Wayne also have symphony orchestras, and one of the best known art colonies in the United States is located in Nashville, in the heart of Brown county.

The popular arts

Indiana's contributions to the popular arts in the United States include the Hoosier poet James Whitcomb Riley, novelists Booth Tarkington, Lew Wallace, and Kurt Vonnegut, satirist George Ade, and the World War II chronicler of the foot soldier, Ernie Pyle. Some of the country's most popular songs have been written by such Hoosiers as Hoagy Carmichael ("Star Dust"), Cole Porter ("Begin the Beguine"), J. Russel Robinson ("Margie"), Albert von Tilzer ("Take Me Out to the Ball Game"), and Paul Dresser ("On the Banks of the Wabash, Far Away"), brother of the novelist Theodore Dreiser. Among the most notable of Indiana comedians have been Herb Shriner and Red Skelton.

Indy 500

Almost every citizen seems to participate in Hoosier Hysteria, the state's annual high-school basketball tournament. Notre Dame, well known for its football talent, vies annually with Purdue and Indiana to provide Hoosiers with exceptional intercollegiate athletics. Indiana University has also become a mecca for basketball and for some of the world's greatest swimmers. Indianapolis is internationally known for the Indy 500, an auto race held annually on Memorial Day. The first race was held in 1911, while the city was still an automobile-manufacturing centre. The entire month of May has become devoted to the race, with such attendant events as a major professional golf meet. Indianapolis is also the home of the professional football Colts, and is the site of the annual U.S. Clay Court Championships, which attract top international tennis players. In 1987 it became the second U.S. city to host the Pan-American Games.

Hoosiers fond of the outdoors enjoy the state parks and forests and the many reservoirs, nature preserves, and wildlife areas. Indiana has many museums and historic sites, including the Levi Coffin House, a stop on the Underground Railroad, in Fountain City, and the Whitewater canal, with a covered aqueduct, in Metamora.

HISTORY

Prehistory and exploration.   Archaeologists have discovered remains of the earliest known inhabitants at Angel Mounds, an archaeological site on the Ohio River near Evansville. Early historical records show that Algonquian Indians organized tribes of the area into the Miami Confederation, which fought to protect the lands from the unfriendly Iroquois. Other important Indian tribes were the Potawatomi and the Delaware. In the 17th century the French made treaties with the Iroquois allowing them to trade with the Miami Confederation.

In 1679 Robert Cavelier, Lord de La Salle, traveled by boat from Michigan down the St. Joseph River. To the south, traders from the Carolinas and from Pennsylvania settled on the Ohio and the Wabash river shores, threatening the French traders, to whom the region was a means of connecting Canada and Louisiana. To protect the route to the Mississippi, the French built Fort-Miami (1704); Fort-Ouiatanon (1719), near present-day Lafayette; and Fort-Vincennes (1732), one of the first permanent white settlements west of the Appalachians.

In 1763 the area, part of what came to be known as the Northwest Territory, was ceded to England, which forbade further white settlement. The prohibition was largely ignored, and in 1774 Parliament annexed the lands to Quebec. During the American Revolution Virginia, Connecticut, and Massachusetts made claims on the land, and in 1779 George Rogers Clark secured the area for the rebelling colonies by leading his troops on a surprise march from Kaskaskia to Vincennes.

Territorial period.   The Northwest Territory was ceded to the United States by the Treaty of Paris, ending the Revolution in 1783, and in 1784 the first U.S. settlement was established at Clarkville, in the southern part of the state. Warfare between the Indians and the whites continued until 1794, when General Anthony Wayne defeated the Indians in a battle near Fallen Timbers, near the present-day Ohio–Indiana line, and the Indians were forced to make land concessions. Increasing numbers of white immigrants from Southern states entered the area after 1800, leading to renewed Indian resistance. In 1811 the last major encounter, the Battle of Tippecanoe, was fought

Indian warfare

near Lafayette, with General William Henry Harrison the victor. Between 1820 and 1840 the major Indian tribes abandoned the area. The Ordinance of 1787 creating the Northwest Territory prohibited slavery, but it did not abolish slavery already in existence, and in 1800 the territory had at least 175 slaves. With the end of Indian resistance came rapid settlement and in 1816 statehood. The territorial capital, Corydon, became the first state capital.

Statehood.   The patterns of rural life and local autonomy were established in the first half of the 19th century as settlement progressed from south to north. The Utopian community of New Harmony, on the Wabash River in the southwest, was settled by George Rapp in 1815 and taken over by Robert Owen in 1825. In 1801 the first college was founded in Vincennes, and in 1820 Indiana University was chartered. A single-car, horse-drawn railroad arrived in Shelbyville in 1834. The constitution of 1851, which remains the framework of state government, made it nearly impossible for the state to go into debt, reinforced the powers of local government, and created a tax-supported public school system. Article XIII prohibited the entrance of blacks into the state, but this was struck down by the U.S. Supreme Court in 1866 as being in conflict with the federal Civil Rights Act of that year.

The period from 1850 to 1900 was one of agricultural and then industrial growth. The Civil War gave impetus to industrialization, and the northern part of the state emerged as a major sector. With the founding of the steelmaking city of Gary in 1906, midway between the iron ore of Minnesota's Mesabi Range and the coal of southern Indiana and Illinois, and with the subsequent development of automobile manufacturing in South Bend, Indiana moved from an agricultural to an industrial base. The isolation, independence, and spirit of Jeffersonian and Jacksonian democracy that underlay the constitution of 1851, however, continued to leave their mark upon the state. The document was written when towns and villages were days rather than minutes and hours apart. It was not until 1970 that annual rather than biennial meetings of the legislature were approved. Other features of the constitution remain impediments to effective management of 20th-century social and political problems, and the ideology of localism is still deeply ingrained.   (W.V.D'A./Ed.)

Development of rural-industrial dichotomy

Iowa

Iowa is a north central state of the United States, forming a bridge between the forests of the east and the grasslands of the high Prairie Plains to the west. Its gently rolling landscape rises slowly as it extends westward from the Mississippi River, which forms its entire eastern border. The state is bounded on the north by Minnesota, on the east by Wisconsin and Illinois, on the south by Missouri, and on the west by Nebraska and South Dakota. Its area is 56,275 square miles (145,753 square kilometres). Iowa, named for the Iowa (or Ioway) Indians who once inhabited the state, was admitted as the 29th state of the Union on Dec. 28, 1846. Des Moines has been the capital since 1857.

The popular image of Iowa—one of corn (maize) and hogs, flat prairies, and conservative people—is not altogether incorrect, but it masks both a subtle variety and the fact that Iowa and its people are very much in a middle position economically, politically, and geographically. With 90 percent of its total land area devoted to farming, Iowa is a major breadbasket of the United States and of the world. In addition, a large part of its industry is directly related to agriculture, and the rural population is still considerable. Iowans are strongly Republican in most years, but they exhibit a lively independence when they feel that the times dictate a different tack. Iowa has not shared the full benefits that have accrued from economic and demographic expansion elsewhere in the nation. Economic downswings that have afflicted other regions affect Iowa to the extent that they involve agriculture.

PHYSICAL AND HUMAN GEOGRAPHY

The land.   Iowa's terrain and rich soils are the products of the continental ice sheets that periodically covered the

Glaciation

state during the Pleistocene epoch, between about 1,600,-000 and 10,000 years ago. Glacial drift deposited by the earliest ice sheets filled the preglacial stream valleys, and little evidence of them remains.

The Illinoian ice sheet covered a small area of southeastern and extreme eastern Iowa, and in so doing it diverted the Mississippi and created a valley along its western front that can still be seen. Some 20,000 to 25,000 years ago the Wisconsin ice sheet moved southward in a lobe that ended at about the site of the present city of Des Moines. The Des Moines lobe began its final retreat about 13,000 to 14,000 years ago. Accompanying the last two stages of glaciation were extensive deposits of windblown silt, or loess, which in the western portion of Iowa were derived from the glaciation of the Great Plains to the west. As the ice sheets retreated, tremendous quantities of drift carried by the melting waters were deposited in the valleys. These various deposits form the basis of the Iowa landscape and make up the parent materials of the present soils.

Relief, drainage, and soils. The most varied relief anywhere in Iowa is in the northeastern part of the state, which was covered by the earliest ice sheets. There tributaries of the Mississippi cut deeply into the underlying bedrock. The Mississippi bluffs stand 300 to 400 feet (90 to 120 metres) above the valley, and the network of tributaries creates a scenic and hilly landscape.

Most of the state is underlaid by pre-Illinoian drift, which has been eroded for at least a few hundred thousand years by a relatively dense network of streams. Lakes or swamps that were left by the ice have long since been drained by natural erosion, and the result is a rolling landscape of great uniformity throughout most of the state. Near the Missouri River valley on the western border, the loess was piled 80 to 100 feet over the underlying drift surface, producing a line of bluffs 100 to 200 feet high. The highest point in the state, 1,670 feet (509 metres) above sea level, is in the northwest. The broad, flat uplands—which form the popular image of Iowa—are found mainly in the Des Moines lobe, a gently sloping, poorly drained drift plain that covers 12,300 square miles (32,000 square kilometres) in the central and north central portions of the state. Most of Iowa's lakes are in the northwestern part of this lobe.

Fertile soils

Most of the soils of Iowa, formed under prairie vegetation, are thick, dark in colour, and rich in organic matter and minerals. Only in the rough northeast and along the dissected river valleys of the south and southeast are there lighter-coloured and less-fertile forest soils.

Climate. Iowa's climate reflects the state's position deep in the interior of the continent. Winters are cold, with January temperatures averaging about 14° F (−10° C) in the northwestern section and 22° F (−6° C) in the southeast. Snowfall is light compared with the amount received in states to the east and north. Summers are warm and more humid, with daytime temperatures averaging 74° F (23° C) in July but varying from region to region. Maritime tropical air masses from the Gulf of Mexico bring frequent thunderstorms, with precipitation in June four times that of the winter months. Precipitation ranges from less than 28 inches (710 millimetres) in the northwest to more than 35 inches in the southeast.

Plant and animal life. Countless species of wildflowers once covered the prairies; and, though most of Iowa's virgin timber was cut long ago, almost 1,500,000 acres (600,-000 hectares) are still forested. The only native evergreen is the red cedar, once found in profusion along the Cedar River. The state's streams are well stocked with dozens of species of fish, and trapping of muskrat and raccoon for furs is still widespread. The ring-necked pheasant—imported early in the 1900s—and quail are the major game birds, replacing the nearly extinct wild turkey. Small animals and a variety of other birds are also found.

Settlement patterns. Although Iowa is not a featureless plain, the relative homogeneity of physical characteristics has led geographers and other social scientists to use the state as an example of large-scale uniformity. Quarter sections of 160 acres formed the basis of much of the original settlement pattern. Consequently, farmsteads and the smaller towns generally are evenly spaced in the form of a grid, and most of the roads in the state follow a north–

south or east–west line. Farmhouses amid the square or rectangular patterns usually have a row of trees serving as a windbreak and providing shade from the midcontinental sun. The largest city, Des Moines, is sited approximately in the middle of the state, above the Red Rock Reservoir of the Des Moines River. The other large cities are on the Missouri and Mississippi rivers at the western and eastern boundaries or on the Cedar River in the east.

The people. Iowa was settled largely by immigration from states lying directly to the east of it and from northwestern Europe. Until 1850 the southern third of Iowa received many settlers from the border states of the South, particularly Kentucky; but the influx from Ohio, Indiana, and Illinois and the New England and Middle Atlantic states was more important in the northern area. Settlers from Europe took on greater significance after 1850. The single most numerous group came from Germany, but Britain and Ireland were well represented. In the later years of the century, many Scandinavians settled throughout the western and central parts of the state. By 1915 there were few foreign-born people in southern Iowa, except Croatians and Italians in the coalfields and Dutch near Pella. The larger of Iowa's cities, particularly those on the Mississippi, attracted a variety of groups.

Sources of immigrants

Several ethnic and religious groups—an example is the Czech population of Cedar Rapids—are still present in Iowa. Among several experiments in communal living, the only survivors of the first years of pioneer hardship are the Amana colonies, a religious group originally from Germany that migrated to Iowa from Buffalo, N.Y., in 1855. This group changed to a corporation in 1932 and has been successful in maintaining its integrity while modifying its economy to fit the times. The strong religious and social traditions of the Amish groups living south of Iowa City and near Independence have come into conflict with modern society over state education laws. Mormons fled through Iowa on their way to Utah to escape persecution in New York and Illinois, and one large group remained behind at Lamoni, in southern Iowa. Quakers were important in the Springdale–West Branch area east of Iowa City in the mid-19th century. This area was an important link in the Underground Railroad, which helped slaves escape from the South before the Civil War. John Brown often visited Springdale, and President Herbert Hoover was born in West Branch of Quaker parents. West Branch is the site of the Hoover Presidential Library.

The only notable immigration into Iowa during the 20th century has been that of blacks to the larger urban centres, particularly Des Moines and Waterloo. Despite state and national civil rights laws, most blacks are concentrated in the decaying urban areas. Most Indians moved westward after federal land purchases in the 19th century, but some returned to purchase a small reservation—the Mesquakie Settlement—near Tama.

Most of Iowa's population is Protestant (primarily Lutheran and Methodist), because major immigration was from northwestern Europe. Roman Catholics are strong in the northeast, in the Dubuque area, and in the larger cities. In its outlook southern Iowa is more fundamentalist; this had such social ramifications as the prohibition of liquor by the drink until 1963.

Major religious groups

Iowa's population is evenly distributed, a factor that, together with the relative uniformity of the state's physical conditions, has made Iowa an excellent location for the testing of geographic and economic theories. Among the largest cities are Des Moines, Cedar Rapids, Davenport, Sioux City, Waterloo, and Dubuque. Most of the remainder of the population lives in scattered, evenly spaced small towns or in dispersed farmsteads. The rural population has declined since the mid-20th century, and Iowa overall experienced population loss in the 1980s.

The economy. The state attempts to aid industrial development and improve the economic situation in Iowa in a number of ways, particularly through trade missions and the activities of the Department of Economic Development. Corporate income taxes contribute a small part to revenues. The government's debt is low, and the overall labour picture is relatively bright. Unemployment rates and work stoppages tend to lag behind national trends.

Harvesting corn on a farm near Alden, north central Iowa.
Thomas Hovland from Grant Heilman

Iowa ranks at about the median for the United States in family income, but this is largely due to the fraction that is derived from agriculture. The cost of living is generally less than that in metropolitan centres of the East and Far West but above that of the South and Southwest.

Agriculture. The popular image of Iowa as an agricultural state is entirely correct. Iowa's agriculture is based on corn and soybean production and on the feeding and selling of animals. Iowa ranks among the top states in the nation in total value of all livestock, in hogs, and in cattle and calves. It is also one of the top three states in value of agricultural exports. The fertile land often produces crop surpluses that contribute to depressed farm prices, a persistent problem in the 20th century.

Industry. Iowa is located on the western fringe of the American manufacturing belt, and, although its manufacturing, trade, and service sectors exceed farming in income, much of the former is devoted to food processing or to the manufacture of agricultural machinery. In only a few instances does Iowa contribute significantly to the national economy in areas not related to agriculture. The production of electronic materials in Cedar Rapids, household appliances in Newton, refrigeration equipment in Amana, tires in Des Moines, writing instruments in Fort Madison, and rolled aluminum in Bettendorf are a few exceptions. Exploitation of mineral resources, except for portland cement and gypsum, plays a relatively minor role in the state's economy.

Transportation. In the 1920s Iowa developed an extensive rural road system designed for the low population density. It now has an excellent system of surfaced roads. The amount of the state's network of railroad track in active use has decreased over the years, and many Iowa towns have lost all railroad service. The state also has more than 240 public airports. Inland waterway traffic is important along the Mississippi River, and a channel nine feet deep runs up the Missouri to Sioux City.

Administration and social conditions. *Government.* Iowa's constitution at the time of admission in 1846 proved to be unsuitable, and a second version was drafted and ratified in 1857. This remains the fundamental law of Iowa, though it has been amended numerous times. The constitution provides for a separation of governmental powers into executive, legislative, and judicial components.

In the executive branch the governor, lieutenant governor, secretary of state, auditor, treasurer, secretary of agriculture, and attorney general are elected for four-year terms; all are eligible for an unlimited number of terms. A number of commissions, boards, and departmental executives are appointed by the governor, though most employees of the state departments are under a civil service system. The Iowa Civil Rights Commission investigates charges, holds hearings, and gives decisions on complaints of discriminatory practices in public accommodations, housing, employment, and education.

The bicameral General Assembly meets every year; longer sessions are held in odd-numbered years, when major budget items are decided. The House of Representatives has 100 members elected for two-year terms, while the Senate has 50 members elected for four-year terms. Both bodies are reapportioned every 10 years to ensure compliance with the "one man, one vote" decision of the U.S. Supreme Court.

The state judiciary is headed by the Supreme Court, which has considerable jurisdiction over the lower courts. The nine members of this body elect their own chief justice. Justices are appointed by the governor, are subject to a confirming popular vote one year later, and after an eight-year term may declare their candidacy for another term. There are 14 judicial districts in the state, with the number of judges varying according to population and caseload. Most larger cities have municipal courts; the others have police and mayor's courts. Justices of the peace are elected in those townships that lack municipal courts.

Local authority is vested in each county's board of supervisors, under which serve the elected auditor, sheriff, recorder, treasurer, and county attorney. The county government collects municipal, school, county, and state taxes; manages welfare; and operates the road system in cooperation with the State Highway Commission. Municipalities have only those powers that have been specifically granted to them by the General Assembly. This was an issue of considerable contention when the legislature was controlled by rural forces, but after reapportionment in the 1960s the urban-rural discord was reduced. Most of the smaller incorporated towns have a mayor–council form of government, whereas most of the larger cities have a council–manager or commission administration.

Iowa's political tradition has been Republican. Between 1848 and 1968 only seven Democrats represented Iowa in the U.S. Senate. The Democrats failed to elect a candidate to the governorship until the Great Depression of the 1930s. Disquiet over farm prices, however, has elicited a substantial Democratic vote on several occasions.

Education. Iowa's first school was opened in 1830. Long known for excellence in education, Iowa ranks above more than half of the other states in expenditure per pupil. The University of Iowa (founded 1847), in Iowa City, is especially noted for the programs in fine arts, and Iowa State University of Science and Technology (1858), in Ames, has shown national and international leadership in the basic sciences, agriculture, veterinary medicine, and related fields. There are also a great number of other public and private institutions of higher learning; nearly all of the latter have religious affiliations.

Health and welfare. Welfare is managed on the county level, as are many health services, though federal and state funds support these activities. Health facilities are adequate in the larger cities and especially in the University of Iowa medical centre in Iowa City, but rural areas suffer from a lack of hospitals and doctors. Hospitals are being upgraded, often with federal support. Compared with other states, Iowa ranks low in the number of doctors per person, and efforts to lure doctors into rural practice have proved unsuccessful: about two-thirds of the doctors trained in Iowa's medical schools establish their practices in other states.

Cultural life. A widely dispersed population with small urban centres makes it difficult for Iowans to support many of the cultural amenities that exist in large urban settings. Traveling shows, including theatre and dance, symphonies, and guest artists visit many places in the state each year. The major cultural centres are the universities and colleges. The fine arts are notably supported at the University of Iowa, where the regional painter Grant Wood

Agriculturally based economy

Executive branch

Republican voting record

did much of his work and where the Writer's Workshop enjoys national esteem. Art museums of significance are found in Iowa City and Des Moines. Such towns as Cherokee and Decorah have museums emphasizing the area's presettlement character or the early European settlers, while Davenport, Des Moines, Cedar Rapids, Sioux City, Dubuque, and Fort Dodge have museums or art galleries.

School sporting events

In a region generally lacking large urban centres, sporting events furnish much of the cultural life. The University of Iowa has long been one of the national leaders in basketball and football attendance. In every college town in the state, football weekends form the centre of the autumn social season. High school basketball and wrestling tournaments evoke great community enthusiasm near the end of the long, cold winters. Outdoor sports of all types are extremely popular, with hunting, fishing, boating, and camping especially prevalent.

Folk traditions are maintained in the Amana colonies, with their Oktoberfest; in the Dutch community of Pella, with its annual tulip festival; among the Czechs of Cedar Rapids; and in other localities.

HISTORY

Prehistory. The earliest inhabitants of what is now Iowa (Paleo-Indians) probably occupied ice-free land during the time when the Des Moines lobe was covered by glaciers. The earliest archaeological evidence of settlement, however, dates from around 8,500 years ago. The hunters and food gatherers of this period existed at the subsistence level, enduring the periodic droughts that continue to plague the region today. Even after the advent of sedentary agriculture in western Iowa around AD 800, entire villages occasionally disappeared. In eastern Iowa, effigy mound builders occupied settlements from about 300 to the 17th century. Most of the early Indians were of the Siouan language family, although Algonquian-speaking tribes were important in eastern Iowa after the 17th century, often displacing the western tribes in bloody conflicts. The Iowa (Ioway) tribe was virtually annihilated shortly before the advent of dense white settlement. All the Indian tribes ceded their lands through treaty and purchase in the 1830s and '40s. The last purchase was of Dakota (Sioux) lands in northern Iowa in 1851.

From territory to statehood. The first Europeans to reach Iowa were probably the French explorers Louis Jolliet and Jacques Marquette in 1673. Permanent white settlement, however, did not take place until the early 1830s, though Spanish land grants were occupied in the late 1700s, principally to exploit the lead-mining potential around the site of Dubuque. In the interim, both pioneers and Indians moved through the area exploring or hunting. The combined French and Indian history can be seen in geographic names throughout the state: for example, Des Moines, Dubuque, and Le Mars; Ottumwa, Keokuk, and Onawa.

The area that includes the modern state of Iowa was included in the Louisiana Purchase from France in 1803, and during the War of 1812 a U.S. garrison was driven from Fort Madison on the Mississippi River. Following

Rapid settlement

the purchase of eastern Iowa from the Sauk and Fox Indians in the 1830s, U.S. settlers rapidly moved in to till the land. The Territory of Iowa was established in 1838, with a population of 23,242. In 1846 Iowa was admitted to the Union as part of a compromise between the slaveholding South and the free North. By 1860 there were nearly 675,000 people in the state, and with the construction of railroads the frontier was pushed farther westward. The population of Iowa more than tripled during the 1850s, and the Spirit Lake Massacre in 1857 marked the final instance of Indian hostility in the state. The years immediately prior to the Civil War were Iowa's frontier days, however, with lawlessness, vigilantes, and lynchings accompanying the unsteady beginnings of a settled society.

Iowa was deeply involved on both sides of the issues that led to the Civil War, to which the state contributed more troops in proportion to its population than any other state. No battles were actually fought in Iowa, though a Confederate guerrilla raid from Missouri occurred in 1864.

Economic stabilization. The end of the Civil War, rail-

road expansion, and the removal of the Indian threat opened the prairie to settlement by massive waves of immigrants from states to the east and also from Europe. By 1900 claims to the land had filled the state, and the population showed a slight decline in the decade that followed. The wide use of barbed wire permitted diversified agriculture, and the draining of wetlands began the development of an efficient agricultural production that often threatened the financial stability of the state with too plentiful a harvest. Corn was the basis of Iowa's agriculture from the beginning, nearly all of the crop being fed to livestock.

World War I created short-term demands for maximum production and high prices, and since then the state has had recurring agricultural surpluses, low prices, and high land values. The various economic panics and depressions of the 19th and 20th centuries were only temporary impediments to this pattern of growth. In the past century Iowa politicians have appeared most prominently on the national scene when farm crises have been major issues.

The last significant case of exploitation of natural resources occurred in the coalfields of southern Iowa, beginning in the mid-19th century and reaching its peak in the first two decades of the 20th century. Most of the coal was quickly exhausted, however, and the miners moved on, leaving behind decaying towns and a deteriorating landscape.

After World War I the population growth of Iowa slowed. Attempts were made to entice industry into the state to diversify the economy, as animal feeding had diversified agriculture half a century before. Such attempts were not entirely successful, and Iowa's economy has continued to be governed by fluctuations in agricultural markets.

(N.E.S.)

Kansas

Lying amid the westward-rising landscapes of the Great Plains of the North American continent, Kansas became the 34th state of the United States on Jan. 29, 1861. In that year the capital was located in Topeka by popular vote, outpolling nearby Lawrence by some 2,700 ballots. The state's 82,277 square miles (213,098 square kilometres) are bounded by Nebraska on the north, Missouri on the east, Oklahoma on the south, and Colorado on the west. The state's name was derived from that of the Kansa, or Kaw, Indians.

Central location

The geographic centre of the 48 coterminous states of the nation is marked by a limestone shaft and a flag located in a pasture near Lebanon, Kan., close to the Nebraska border. Some 40 miles (65 kilometres) to the south is the magnetic, or geodetic, centre of the terrestrial mass of North America; this is the reference point for all land survey in the United States, Canada, and Mexico.

Kansas was once seen as the agricultural heartland of the nation. After 1952, however, industry began to contribute more to the economy than did the wheat fields and cattle ranches. Wichita, the state's largest city, is known locally as the Air Capital of the World because it produces more general aviation aircraft than any other city.

PHYSICAL AND HUMAN GEOGRAPHY

The land. *Relief, drainage, and soils.* Kansas has been characterized as a featureless plain, but its topography, while rarely spectacular, is varied. The land rises slowly but steadily from 700 feet (213 metres) above sea level in the southeast to 4,039 feet (1,231 metres) near the Colorado border. The far western section consists of high plains with few natural trees and appears flat and endless. Actually these plains are creased with shallow gullies, called draws, the product of millennia of erosion. Here are some of the state's most striking geologic formations. Castle Rock, south of Quinter, consists of chalk spires rising high above the level plains. Monument Rocks, a few miles to the west, resemble sphinxes. Near Jetmore is Horse Thief Canyon, a miniature of the Grand Canyon.

Under irrigation, southwestern Kansas has come to produce truck crops and sugar beets. Northeastern Kansas, once covered by the glacier that crept over most of the northern United States, is hilly and timbered, with many

creeks and springs. The southeast, lying near the foothills of the Ozark Mountains, is rough and covered in parts with scrub oak. In south central Kansas near Medicine Lodge are the Gypsum Hills, which resemble the mesas of the Southwest and are named for the gypsum found in them. In east central Kansas the Flint Hills stretch from north to south; gentle, rolling, largely treeless, and covered with bluestem, they provide the only extensive unplowed tract of true prairie remaining in the United States.

The principal rivers are the Kansas and the Arkansas. Tributaries of the Kansas are the Big Blue, the Republican, the Solomon, the Saline, and the Smoky Hill, all in northern Kansas. The Arkansas flows into the state from Colorado and winds through southwestern and south central Kansas, continuing through Oklahoma and Arkansas to the Mississippi. Tributaries of the Arkansas are the Cimarron, the Verdigris, and the Neosho (Grand).

Millions of years ago much of Kansas was the floor of an inland sea. The land was built up by the deposit of soil and vegetable matter from streams feeding the sea. This **Fertile soil** residual soil is among the most fertile in the world, and in it prehistoric fossils of great importance have been found.

Climate. The climate of Kansas is temperate but continental, with great extremes between summer and winter temperatures but few long periods of extreme hot or cold. The annual average temperature is 55° F (13° C). The growing season ranges from mid-April to mid-September. Normal annual rainfall ranges from less than 20 inches (500 millimetres) in the west to more than 40 inches in the southeast.

Plant and animal life. Buffalo grass is native in the west and central areas of the state, bluestem around the Flint Hills, and bluegrass in the east. Wildflowers of many kinds are found in all parts of the state, and sunflowers grow in profusion (Kansas is popularly known as the Sunflower State). The cottonwood grows throughout Kansas, while in the northeast there are many oak, walnut, and maple trees, as well as cedar and elm. Western Kansas abounds in quail and pheasant and has the largest population of prairie chickens (grouse) in North America. Deer, once almost extinct, were protected by law for many years and have multiplied to the degree that hunting is again allowed. The once proliferating buffalo that roamed the plains are now found only in parks and zoos.

Settlement patterns. Most western Kansas farms or ranches are large, covering not less than one section (a square mile, or 640 acres [259 hectares]) of land, though a farmer's holdings may not always be contiguous. Eastern Kansas began with small farms, some of no more than 40 acres; but these have grown. A Kansas law forbids other than family corporations for farming purposes. Most of the small towns are modern and well kept, with paved streets and full utilities. Many of the small cities, especially in the west, present unexpected cultural and commercial resources, perhaps because they often lie far apart and draw from large trade territories. In the east the cities are older, closer together, and generally less progressive, though most of them are attractive, with broad, well-shaded residential streets and downtown shopping facilities.

Wichita, the largest city, has the state's largest buildings, biggest industries, and most venturesome businesses. In Topeka, where state government once was the largest industry, more people now are employed in services. Kansas City, Kan., merges with its larger neighbour, Kansas City, Mo., and contains a significant part of the industrial complex of that region, as does neighbouring Johnson county. Leavenworth, the state's oldest city, is built around institutions, including an army post at Fort Leavenworth, a federal prison, a state penitentiary (in the bordering city of Lansing), and a veterans' hospital. Lawrence, home of the state's largest university, depends on the school for its economy, though the city has worked successfully for industry. Most of the other cities depend on farm trade and agriculturally related business.

Region-alism Kansas suffered during most of its history from two kinds of regionalism: one that pits rural against city dwellers; the other, the east against the west. The two are related in that none of the state's principal cities is in the west. More thinly populated than the east, western Kansas has always

feared and fought eastern domination, while the east often has ignored the west. Wichita, one of Kansas' four metropolitan areas, contains nearly one-fifth of the state's population. The Kansas City–Lawrence–Topeka area of northeastern Kansas, containing three metropolitan areas, is more populous and is the centre of much industry. Rivalry between these two urban areas is obvious in the state legislature. People from the rural areas, mostly farmers, ranchers, and owners of small businesses, as well as residents from the smaller towns, have tended to distrust the cities, often bringing about an impasse in the legislature.

The people. Kansas' early settlers were principally antislavery New Englanders of Anglo-Saxon stock. After the Civil War and with the building of the railroads, many central Europeans were attracted by the promise of jobs laying track and of free land when the jobs were finished. Small communities populated by citizens of predominantly Russian, Bohemian, German, or Scandinavian ancestry still dot the state. The original languages have largely disappeared, though here and there church services are still conducted in German or Swedish, and a few communities hold festivals each year at which the old folkways, foods, and languages are featured. During World War II there was an influx of servicemen and aircraft workers, many of whom remained. The state is largely Protestant, with large communities of Methodists, Baptists, and Lutherans. Virtually every sect is represented in the state, including such rare groups as the Amish and the Dunkard Brethren. Roman Catholics are slightly more than one-fourth of all religious adherents.

Because of insufficient employment opportunities, Kansas loses a considerable number of its young people to other states. The birth rate, however, produces a slight natural increase in population in most years. The most conspicuous demographic trend is from the farms to the cities. As further technological advances in farming are made and individual landholdings increase in size, this trend undoubtedly will continue.

The economy. The national trend away from manufacturing and toward service industries has been experienced to a lesser degree in Kansas, which remains above the national average in percentage of employees in manufacturing. Small and medium industries account for increasing percentages of the overall numbers of employees. The availability of a reliable work force is one of the advantages the state has to offer to prospective employers.

Resources. Kansas has abundant farmland, large mineral resources, a good labour force, a healthy retail trade, ample electrical power, plenty of water, and a central location. It is among the 15 top mineral-producing states. Oil and gas production is declining, but Kansas leads the nation in production of helium and is a major producer of portland cement, stone, clay and clay products, sand, salt, gravel, zinc, bituminous coal, and lead, and its chalk supply is virtually limitless. In petroleum refining capacity Kansas remains among the top states. Kansas has imposed only a small severance tax (laid at the time of severance, or extraction from the ground) on oil or gas for the purposes of conservation and pollution prevention.

Agriculture and industry. Both agriculture and manufacturing contribute significantly to Kansas' economy—the former contributing many raw materials for the latter. The production of its farms and ranches places Kansas first among the U.S. states in wheat and first in sorghum grains. It also ranks high in wild hay, beef, and hogs.

Manufacturing and processing plants produce everything from airplanes to zinc castings. Wichita is a major producer of camping gear; it also manufactures heating and air-conditioning equipment, snowmobiles, and a variety **Varied manufacturers** of other products. In addition to ranking first in the world in production of general aviation aircraft, Wichita also is an important manufacturing centre for military aircraft. Other plants in the state turn out baby foods, pet foods, prefabricated houses, mobile homes, greeting cards, tires, paint, and dishwashers. The state has a right-to-work law that forbids compulsory unionism. Most cities issue revenue bonds to encourage new industry. Kansas still leads the nation in wheat milling, despite some decline, and is among the top producers of processed beef.

Grain elevators at Mingo in northwestern Kansas.
Grant Heilman/Grant Heilman Photography

Military installations. Two long-established army posts have contributed significantly to the state's economy. Fort Leavenworth, with its renowned Command and General Staff College, dates from 1827. A major outpost in the early Indian wars and during the Civil War, it has offered sophisticated training to international military officers for many years. Fort Riley, near Junction City, was established in 1853 and was also an Indian outpost. In the 20th century it has been an important infantry-training centre and is the home of the famous 1st Infantry Division (The Big Red One). McConnell Air Force Base at Wichita is a part of the Strategic Air Command and one of four bases in the nation to house the B-1B bomber.

Transportation. Kansas has an excellent system of railroads for east–west transport but, except in the east, has less adequate north–south lines. The same may be said of its highways. Exceptions are the state's single toll road, the Kansas Turnpike, which runs southwesterly from Kansas City to the Oklahoma line south of Wichita, and Interstate 135. Although Kansas has more than 350 airports and is served by several airlines, the only major airport with transcontinental service is in Wichita.

Administration and social conditions. *Government.* Under the constitution adopted in 1859, Kansans elect a governor, lieutenant governor, attorney general, and secretary of state; most other state officers are appointed. The legislature comprises 125 representatives and 40 senators, elected for two-year and four-year terms, respectively. The legislature holds an unlimited session in odd-numbered years and meets for no more than 90 days in even-numbered years. Each of the 105 counties elects commissioners, a county attorney, a treasurer, and other officers. Judges of the 31 judicial districts are elected, but the seven justices of the Supreme Court and seven judges of the Court of Appeals are appointed by the governor from a panel presented by a Supreme Court nominating commission. The justices are subject to the approval of the voters.

The first legislative council in the United States was inaugurated in Kansas in the 1930s. It was an interim body designed to work between legislative sessions at analyzing and drafting laws. Several other states later adopted legislative councils. The 1969 legislature provided for prefiling of bills between sessions, a change that persuaded the legislature that the council was no longer necessary. It was replaced in the 1971 session by the Legislative Coordinating Council, made up of the leadership of both houses.

Innovations in government and law (margin note)

In 1933 Kansas enacted a "cash basis law," which requires that no state money be expended until it has been raised and appropriated by the legislature. Bonds have been issued only for capital improvements, such as state buildings and highways, in which case they are retired by user fees.

Kansas once was known as the most Republican state in the nation, but it now has a sizable Democratic minority, a growing independent vote, and a small Libertarian contingent. The first legislature, in 1861, gave women the right to vote in school elections. In 1887, women's suffrage was extended to city and bond elections, and in that year the country's first woman mayor was elected in Argonia. The state constitution of 1861 granted women equal rights to own property and to have control of children. Universal suffrage was granted in Kansas in 1912. Kansas ranks high among the states in the proportion of women holding public office.

The Farmers' Alliance and the People's (Populist) Party both had their origin in Kansas, and in the 1890s they played an important part in the politics of the Midwest. Kansas pioneered the direct primary election, and a Kansas senator introduced the resolution in the U.S. Congress that put direct election of U.S. senators into the federal Constitution.

Kansas was the first state to adopt the constitutional prohibition of alcoholic beverages. The prohibitory amendment was added to the state constitution in 1880 and was not repealed until 1948. In 1986 voters approved a constitutional amendment permitting the sale of liquor by the drink in establishments that do at least 30 percent of their business in food sales. In the same election parimutuel wagering and a state lottery were approved.

Education. A landmark civil rights case of the 20th century, *Brown* v. *Board of Education,* originated in Topeka in 1951, when the clergyman father of a nine-year-old black girl led her to the door of an all-white school. She was denied enrollment, and the decision that was handed down by the U.S. Supreme Court in 1954—basically stating that segregated, even "separate but equal," education is inherently unequal and must be eliminated with all due speed—became the basis for most of the civil rights decisions that have been applied to schools since that time.

In the mid-1960s Kansas abolished its office of state superintendent of public instruction and substituted the Department of Education headed by a commissioner and an elected state board of education. There are some 300 public school districts throughout the state. A number of two-year colleges and vocational-technical schools are operated by the communities in which they are located.

Kansas has six state universities. Fort Hays State University, Pittsburg State University, and Emporia State University offer liberal arts degrees. The University of Kansas is located in Lawrence, Kansas State University in Manhattan, and Wichita State University in Wichita. Kansas State, recognized as having one of the country's leading agricultural colleges, was the first land-grant university in the United States. The state's medical school is part of the University of Kansas Medical Center, with its campus at Kansas City. In 1971 the School of Medicine established a second campus at Wichita to expand its clinical teaching facilities. There are two law schools, one at the University of Kansas, the other at Washburn University of Topeka, a municipal school. In addition, there are several church-affiliated, private four-year colleges in Kansas, all offering liberal arts degrees.

Universities and colleges (margin note)

Health and welfare. A Department of Health and Environment is responsible for health information and education and has supervisory authority over environmental problems, water and waste management, air quality, and radiation, as well as food, drugs, lodgings, vital statistics, and general health concerns. A Department of Social and Rehabilitative Services operates mental hospitals at Topeka, Osawatomie, Larned, and Norton and offers services in geriatrics, public health nursing, nutrition, maternal and child health, and mental retardation. The Menninger Foundation and Clinic are at Topeka.

Since 1862 Kansas has had some form of public assistance for the needy. The Department of Social and Re-

habilitation Services offers financial assistance and special education. Vocational and rehabilitational services also are provided for the handicapped. There are schools for the mentally retarded at Parsons, Winfield, and Norton. A children's home has operated at Atchison since 1855; there is a state treatment centre for mentally disturbed children at Topeka and a girl's reformatory at Beloit.

The state has a fair housing law and a civil rights commission that hears grievances and attempts to mediate them.

Cultural life. The citizens of Kansas resent the suggestion that they live in a cultural desert, but the assertion is at least partially true. Most of the larger cities have amateur theatre groups, while Topeka and Wichita support symphony orchestras. The numerous colleges and universities in the state provide a concentration of art and music in many small communities that otherwise would have no comparable activities. In the sparsely populated areas of western Kansas, however, a large number of the small communities have few cultural institutions except a public library. Wichita, however, has several art museums and a cultural and civic centre with two theatres, an exhibition hall, and a convention hall. The extreme eastern areas of Kansas look to Kansas City, Mo., for cultural attractions. In the mid-1960s the Kansas Arts Commission was formed; funded by the state, it seeks to encourage the development of the arts, often providing money for communities or organizations that want to develop cultural events. The University of Kansas has an outstanding museum of natural history and an art museum. The Eisenhower Center at Abilene, boyhood home of the 34th U.S. president, has a museum and a library containing the papers and memorabilia of his presidency and military career.

Traditional commemorations   In addition to an art museum, the small community of Lindsborg has a biennial folk festival, the Svensk Hyllningsfest, which honours the Swedish pioneers who settled the town. It features Swedish costumes, traditional food, folk dances, and displays of the arts and crafts of local artisans. Wilson has a Czech festival each year. Examples of eccentric folk sculpture are found in Lucas, where a self-taught artist, working in wet concrete, sculpted his own idea of the Garden of Eden and other biblical stories.

HISTORY

Indians, explorers, and settlers. Archaeological exploration has uncovered evidence of Indian cultures that existed in Kansas for many centuries before the Europeans settled on the land. From about 1200 to 1500 there had been a thriving agricultural society in the area of the Republican and Big Blue rivers.

The first known European explorers were Spaniards under Francisco Vázquez de Coronado, who in 1541 rode northward from Mexico seeking the gold of the legendary Seven Cities of Cíbola. Juan de Padilla, a priest with the expedition, founded the first mission in the territory, possibly north of present-day Wichita. The territory was claimed for France in 1682 by Robert Cavelier, Lord de La Salle. During the 18th century French fur traders had a flourishing exchange with the Indians in what is now the northeastern part of the state.

The region passed to the United States as a part of the Louisiana Purchase in 1803. The explorer Zebulon Montgomery Pike passed through Kansas in 1806 and described it as the "Great American Desert"—a false image that still persists. Kansas was thoroughly explored during the following decades, but westward-bound settlers and miners passed through it without staying.

Creation of Kansas Territory   From 1830 to 1854 Kansas was in an area designated as Indian Territory, where tribes who occupied lands wanted by whites were relocated. The Kansas–Nebraska Act of 1854, however, created two territories and opened both to settlement, allowing residents to determine whether their future states would be free or slave. The rush began, and Kansas became a major breeding ground for the American Civil War as North and South each attempted to send the most settlers into the new territory. Most early settlement was near the eastern border, and free staters were harassed constantly by Border Ruffians from Missouri. One incident was the sacking of Lawrence by Southern guer-

rillas in 1856. The abolitionist John Brown, with his sons and a few other men, retaliated by dragging five of their proslavery neighbours from their homes and killing them. Proslavery forces attempting to avenge this massacre were captured by Brown, who became a hero to the Northern sympathizers. Hundreds of such incidents won the territory the name Bleeding Kansas.

Statehood. Kansas entered the Union as a free state in 1861. Before and after the Civil War sporadic fighting occurred between the settlers and the Indians. In 1867 a peace treaty was signed in which the Indians agreed to sell their land; in return, the United States agreed to build homes for them in what is now Oklahoma and to provide money, food, and clothing. The U.S. Congress did not honour the treaty, and when the Indians returned they found their land occupied by white settlers. Further sporadic battles continued until the last Indian raid, in 1878.

Early settlers in wooded eastern Kansas lived in log cabins, but in the west they had only dugouts or sod houses. The unpredictable weather, the recurring Indian raids, the droughts and dust storms, and the grasshopper invasions discouraged many early settlers. One of the heroes of this era was William Mathewson, known as the original Buffalo Bill, who hunted buffalo for the settlers all of one winter without pay, providing meat by the wagonloads. The coming of the railroads in the late 1860s and the '70s made first one village and then another into boisterous cow towns. Texas cattlemen drove herds northward to Caldwell, Wichita, Dodge City, Ellsworth, Newton, and Abilene to reach the railhead. Although this development brought prosperity to Kansas and created a persistent image, the cow-town era lasted less than a decade.

The Mennonites arrived in 1874, bringing trunks full of hand-selected grains of Turkey Red wheat. This excellent strain was the basis of the abundant crops that became an important part of the Kansas economy. Many of the Mennonites' descendants remain as prosperous farmers.

Expansion of agriculture   By about 1890 most of the land was occupied, and Kansans settled into a life dominated by agriculture. World War I produced a great demand for food, and more and more prairie was plowed and put into production, which led to temporary prosperity but contributed directly to the dust storms that devastated the state in the 1930s. World War II contributed to Kansas' growing eminence in aircraft and brought many people from Oklahoma and Arkansas to work in Wichita's aircraft plants.

The decades of the 1970s and '80s were characterized by a slow but steady growth in population, one of the lowest unemployment rates in the nation, and a steady increase in the number of Kansans employed in mining and in health care and other service industries. Kansas remains a Republican stronghold, but, for 20 of the 30 years between 1957 and 1987, Democrats occupied the governor's office, suggesting that some political as well as economic change has been taking place in Kansas.   (C.G.P.)

Michigan

Since its admission on Jan. 26, 1837, as the 26th state of the Union and the fourth to be carved from the Northwest Territory, Michigan has become a mainspring in the economic life of the United States; the name of its largest city, Detroit, has become a byword throughout the world for the American automotive industry. The state also has retained its prominence in agriculture, and, because of its many inland lakes, its borders on four of the five Great Lakes, and its many wilderness tracts, Michigan has evolved into one of the nation's leading tourist regions.

The Upper and Lower peninsulas   Michigan is the only one of the 49 continental states to be split into two large land segments: the sparsely populated but mineral-rich Upper Peninsula slices eastward from northern Wisconsin between Lakes Superior and Michigan, and the mitten-shaped Lower Peninsula reaches northward from Indiana and Ohio. The two landmasses have been connected since 1957 by "Big Mac," the five-mile (eight-kilometre) Mackinac Bridge across the Straits of Mackinac, which separate Lake Michigan on the west from Lake Huron on the east. Between Lake Huron and Lake Erie, in the southeast, the Lower Peninsula is sep-

arated from the Canadian province of Ontario by Lake St. Clair and the St. Clair and Detroit rivers. The state's name is derived from an Ojibwa (Chippewa) Indian word meaning "large lake." Although its 58,527 square miles (151,586 square kilometres) rank the state only 23rd nationally in size, the inclusion of Great Lakes waters over which it has jurisdiction raises the figure to 97,102 square miles (251,495 square kilometres), placing it 10th.

More than 70 percent of the state's residents live in urban areas, with a heavy concentration in the industrialized centres of the Lower Peninsula. This factor, together with a broad array of ethnic and national stocks among the people and a high number of lesser-skilled workers attracted to Michigan by the union-dominated labour scene, has created in many cities the typical marks of economic progress and poverty existing side by side, with a sometimes tenuous social stability. The state government, in the capital of Lansing, coordinates a vast network of programs attempting to reduce these contrasts, and it has provided a system of public higher education that is among the most diversified and renowned in the nation.

PHYSICAL AND HUMAN GEOGRAPHY

The land. *Relief.* The mildly rolling countryside of Michigan appealed to the early agricultural settlers. Elevations are not high. The highest point in the Lower Peninsula, near Cadillac, rises only about 1,600 feet (488 metres). Elevations rise to over 1,900 feet only in the western Upper Peninsula.

Several physical features of Michigan are appealing. The sand dunes on the Lake Michigan shore are used annually by thousands of vacationers, and state forests, parks, and wildlife areas, containing more than 4,000,000 acres (1,619,000 hectares) of wooded land, include varied landscapes that have helped Michigan to become a major tourist attraction of the Midwest.

Drainage. Michigan's rivers, the majority of them in the southern part of the Lower Peninsula, drain vast interior areas. Most of them are shallow and narrow. Their navigability and the ease of bridging them encouraged settlement. Several of the rivers, especially in the Upper Peninsula, have falls to serve as a basis for waterpower.

Inland lakes

Michigan's 11,000 inland lakes range in size from a few acres to the 20,000 acres (8,000 hectares) of Houghton Lake in the north central Lower Peninsula. The shores of many lakes are ringed with summer cottages, as are the shores of the Great Lakes in many places. Two recreational areas in the state include the Pictured Rocks National Lakeshore on Lake Superior and the Sleeping Bear Dunes National Lakeshore on Lake Michigan.

About 500 islands dot the lakes and rivers. Belle Isle, a public recreation centre, and Grosse Ile, largely residential, are well-known features of the Detroit River. Mackinac Island is a resort on which motor vehicles are prohibited. Isle Royale, a virgin wilderness of nearly 900 square miles, is a national park in western Lake Superior.

Soils. Michigan soils vary with the diversity of climate, landforms, and water conditions. Clays and loams in the southern Lower Peninsula permit extensive agriculture, while unproductive sandy soils dominate in the northern Lower Peninsula. The Upper Peninsula has a few acres of fertile loam, but most of the soil is sandy and similar to the northern Lower Peninsula. Bog or muck soils, which were created as inland lakes became filled with organic matter, are found throughout the state, especially in the southeastern Lower Peninsula. These soils are particularly important for vegetable production.

Climate. The Great Lakes cool the hot winds of summer and warm the cold winds of winter, giving Michigan a milder climate than some other north central states. Although the Upper Peninsula is cooler, the temperature ranges in the far northern and far southern cities do not differ excessively. In the far north, Sault Sainte Marie has an average January temperature of about 14° to 16° F (−10° C to −9° C) and an average July temperature of about 64° F (18° C). In Detroit, in the southeast, the respective averages are 26° F (−3° C) and 73° F (22.8° C). The greatest amount of moisture is received in southern Michigan, and the state's average is about 31 inches (787

millimetres). The central portion of the state has less precipitation than does the Upper Peninsula, and the coastal strip along Lake Michigan receives an unusually large snowfall from westerly storm fronts moving across the lake. The growing season ranges from approximately three months in the Upper Peninsula to as long as six months in the more southerly portions of the Lower Peninsula.

Plant and animal life. Almost all of Michigan was once heavily wooded, with genuine prairies or clearings found only in the southwest. Hardwood timbers included the hickory, ash, oak, and hemlock, though the white and Norway pine were the most common timber in the north. Animals native to the area are numerous. Whitefish, lake trout, and salmon in abundance swim in the Great Lakes, and many of Michigan's streams contain various edible trout. The Department of Natural Resources operates hatcheries and encourages tourism around the inland lakes, where perch, pike, and bass abound. The beaver was sought eagerly by early traders, and other fur-bearing mammals were also found in large numbers. Deer and bears, as well as quail and ducks, remain numerous in many counties.

Settlement patterns. Many of Michigan's people think of their state as divided into the Upper and Lower Peninsula, but the two physiographic divisions, the Superior Upland and the Central Lowland, follow this plan only in part. The Upland comprises the rugged western region of the Upper Peninsula, where the abundance of copper and iron ores has made the area economically dependent on the mining industries. Ironwood, Iron Mountain, Hancock, Houghton, and Marquette are among the larger cities. Agriculture is insignificant, but tourism and recreation offer possibilities for diversifying the economy.

Geographic divisions

Geographic and historical forces unite the eastern counties of the Upper Peninsula with the Lower Peninsula north of the Bay City–Muskegon corridor to create the area known as northern Michigan. There the white pine forests were exploited. The sandy soil, with adequate moisture, produces an abundant yield of potatoes and grain. Fruit growing along the Lake Michigan shore north to Traverse City has succeeded because the lake's influence prevents early killing frosts. The towns in the north serve as regional centres for tourists and farmers and often as headquarters for governmental services. Many of the larger communities have attracted small-scale manufacturing. Cities in-

©Terry Donnelly from TSW—CLICK/Chicago

Shore of Lake Superior near the mouth of the Mosquito River in Pictured Rocks National Lakeshore, Upper Peninsula, Michigan.

clude Sault Sainte Marie, Petoskey, Ludington, Manistee, Cadillac, and Traverse City.

South of the Bay City–Muskegon corridor a fertile clay soil and a longer growing season permit a wider variety of crops, especially grains. The southern agricultural counties produce much of the state's agricultural wealth. The region also contains industrial concentrations and numerous large cities, including Detroit, the sixth largest U.S. city, Flint, Lansing, Grand Rapids, and Battle Creek.

The people. The diverse backgrounds of Michigan's people have been important in shaping the state's character. The percentage of foreign-born and first-generation citizens is small, however, even in Detroit.

Germans were the most numerous of the early non-English-speaking immigrants. Detroit had a large German community by the mid-1830s, as did several rural counties by 1850. The large Irish population was basically urban, although Irish farmers were found in southern Michigan and by 1860 in the Upper Peninsula. Dutch influences are still observable in western counties around Holland, where Dutch settlers pioneered successfully in 1847. Finns and the Cornish have been important in the economic and cultural life of the Upper Peninsula. Early Polish immigrants settled in rural areas until the 1890s, when a large number of Poles became concentrated in Detroit. The city's present-day population includes many people of Polish ancestry. More recently Hispanics, Asians, and immigrants from the Middle East have contributed to Michigan's ethnic mix.

The
growing
black
population

The most significant population phenomenon of the 20th century has been the growth of the black population, from fewer than 16,000 in 1900 to well over 1,000,000 by the late 20th century. More than 60 percent live in Detroit, which has become nearly two-thirds black. Many blacks have moved to suburbs with long-established black neighbourhoods. They also have moved into older neighbourhoods and central city areas where the prices of homes are not exceptionally high. The majority of the newer Detroit suburbs, however, have very small black populations.

Michigan's religious history differs somewhat from that of many of the other Midwestern states. Because the first European settlers in Detroit were Roman Catholic, many immigrants of that faith were attracted to the city even before the large Irish, Italian, and Polish immigrations of the 19th century. Detroit was made a diocese in 1833 and an archdiocese in 1937. Other dioceses were established at Marquette, Grand Rapids, Lansing, Saginaw, Gaylord, and Kalamazoo. Of the Protestant denominations, Lutheranism has had many German and Scandinavian adherents, while Methodism has been important in both rural and urban Michigan. The first Dutch settlers were members of the Christian Reformed church, which was opposed to the state church of the Dutch. The Michigan group was highly independent and conservative in its doctrine and social mores. There also are large numbers of Presbyterians, Baptists, and Episcopalians. Altogether, Michigan has almost 200 Protestant denominations, some with only small memberships. The first Jewish immigrants to come to Michigan were of German background. In 1851 Detroit Jews founded a synagogue. Synagogues throughout the state reflect all forms of Judaism.

The economy. Michigan's economy, following a period of dependence in the 19th century on mining and lumbering, began in the second decade of the 20th century to be dominated by the automobile industry. Despite contributions from agriculture, tourism, forestry, and industries, producing goods such as office furniture, cereal, oil, chemicals, and pharmaceuticals, Michigan remained tied to the fortunes of the auto companies. The oil embargo of the late 1970s, combined with a dramatic increase in imports of foreign cars and a national economic recession, caused an economic crisis in Michigan. Between 1979 and 1982 the state's unemployment level climbed above 15 percent, the highest in the nation. Since then the auto industry has made a modest recovery, and Michigan's government and business leaders have initiated programs to expand the state's manufacturing base, to attract new high-technology firms, and to promote the service sector of the economy. Nevertheless, the automotive industry continues to

Domi-
nance
of the
automobile
industry

dominate the economy, accounting for about one-third of all manufacturing employment and one-third of the total value added by manufacture.

The state government maintains many research divisions that offer assistance to various segments of the economy. The Department of Agriculture administers divisions of animal health, marketing, and soil conservation. The state tax structure attempts to avoid discrimination against the private sector. Michigan has had a workers' compensation law since 1912. Extensive programs of social legislation, including unemployment compensation, were undertaken in Michigan before World War II and have since been broadened.

Resources. Michigan is one of the nation's leading producers of iron ore, accounting for nearly one-third of the total national output, but changes in the U.S. steel industry have severely affected iron ore mining in the state. In 1984 all mining activities in the Menominee Range ceased, although production continued in the Marquette Range in Marquette county. Some deposits of gypsum for cement and of salt have not been touched, and the search for petroleum and natural gas continues.

Agriculture. Despite a continuing decline in the number of farms, Michigan's fertile soils make it a major agricultural state. The future of Michigan's agriculture is, however, dependent in part on prices. Many farmers work part-time in industry or for the government, an important factor in the economy of many rural communities. Corn is Michigan's major field crop, but the state is best known for its fruit production. Michigan leads the nation in the production of cherries and is a major producer of apples. The state usually is also the leading producer of dry beans in the United States. Christmas trees are another important agricultural product. Michigan forests also produce large quantities of pulpwood products, and the timber industry is undergoing a revival.

Fruit
growing

Industry. Many reasons have been advanced for the rise of the automotive industry in Detroit. The city long had been noted for the manufacture of carriages, wagons, bicycles, and marine engines, and it had a large number of skilled and semiskilled labourers and an available supply of investment capital. Other cities, however, offered inducements equal to those of Detroit, and during the pioneering phase of the industry Detroit had a number of rivals.

Personalities played a major role in making Detroit the world's automotive centre. The industry began with Ransom E. Olds of Lansing, whose father manufactured gasoline engines. Olds's success by 1901 focused the attention of automotive people on Detroit. Henry Ford brought even greater fame. Organizing the Ford Motor Company in 1903, he was by 1908 confining production to the standard, low-priced Model T. He emphasized ease of repair, garage service, and the utility of his product. W.C. Durant of Flint recognized that the automobile would be purchased by persons who desired transportation rather than by faddist motorists. He hoped through the formation of a company with large-scale capital to speed up technological advances and thus capture a large portion of the untapped middle-class market. The General Motors Corporation stands as a testimony to his thinking.

The industry paid high wages, and many automotive workers became members of the middle class. Because of the high wages there was little interest in unionism until the Great Depression of the 1930s.

The automotive industry also played an important role in the growth of Flint, Pontiac, and Lansing. Grand Rapids attained prominence through its furniture industry, and Battle Creek is known nationally for its cereals.

Tourism brings Michigan millions of dollars annually, depending on the protection of forests, rivers, lakes, and shorelines from careless development and pollution.

Tourism

Transportation. The first railroad in Michigan, the Erie and Kalamazoo, was completed between Toledo and Adrian in 1836, and by 1870 the state had more than 1,600 miles of rail. The peak of 9,000 miles in 1910 has since been reduced by well over half. In contrast, the gains in motor vehicle ownership have been staggering. State and local governments have combined to give Michigan a

modern system of state highways, county roads, and city streets. The interstate express system has been built largely with federal assistance.

Air passenger service in Michigan began in 1926. Detroit Metropolitan Airport services millions of airline passengers annually, and there are some 20 other major airports throughout the state and several small commuter airlines. Much of the airfreight of metropolitan Detroit is handled at the Willow Run Airport, a facility constructed as a bomber plant during World War II.

The waterways carry tremendous tonnage, with many of the state's exports shipped from Detroit's harbour. Ores and other bulk materials destined for the interstate trade are generally sent by water.

Administration and social conditions. *Government.* The constitution of 1963 included a number of provisions to streamline government and make it more responsive to the problems of a modern industrial and urban society. Amendments may be submitted to the electorate by the legislature or by initiative petitions, but all amendments must be approved by a referendum of the voters.

Executive power is vested in the governor, who serves for four years. The governor is nominated by a primary election, but the lieutenant governor is chosen by party convention. Administrative commissions appointed by the governor are responsible to the executive and to several advisory commissions. The majority of the important governmental services are combined under departments responsible to the governor. A few of these bodies, such as the State Highway Commission, must be bipartisan.

The legislative branch comprises the Senate of 38 members elected for four-year terms and the House of Representatives of 110 members elected for two-year terms. The legislative districts are redefined by a special bipartisan commission after each federal census. The highest court is a seven-member state supreme court. The state also has a court of appeals, circuit courts, probate courts, and courts of limited jurisdiction that are specified by the legislature.

Local govern- ment

Michigan has more than 2,600 local governmental units, including counties, municipalities, townships, school districts, and such special districts as park authorities. Although the majority of counties are governed by a board of supervisors, the home-rule privilege allows larger counties to entrust management to county commissioners. Extensive privileges of home rule are authorized for the cities as well. School districts are classified by population and enjoy differing privileges of government.

The precinct is the primary unit of political party organization, and the precinct delegates carry considerable importance in the annual party conventions, where candidates are nominated for lieutenant governor, attorney general, secretary of state, and the members of the boards that govern the state system of higher education and the State Board of Education. Justices of the Supreme Court are nominated on a nonpartisan ballot. The state party conventions also select delegates to the national presidential conventions.

Black political interest grew out of the Civil Rights movement, and civil rights groups have encouraged the political awareness of black voters. Blacks have been nominated for major state and local offices by both parties; Coleman Young was elected the first black mayor of Detroit in 1973. William Lucas, nominated in 1986 by the Republican Party, was the first black to run for governor of Michigan; he was defeated by incumbent James Blanchard. Unions have been very active in Michigan politics, and the United Automobile Workers has endorsed candidates at the municipal, state, and national levels.

The personal and corporate income tax is the major source of general revenue, though federal aid and receipts from the sales tax and property tax play a major role in assuring the financial structure of the state. Gasoline and vehicle tax revenues are reserved exclusively for highways.

Higher education

Education. Many of the legislature's major appropriation bills are for support of Michigan's numerous public institutions of higher learning, including many community colleges. Large sums, however, are returned to the local districts for public elementary and secondary schools. Many of these schools, both in the inner-city areas and in the suburbs, are frequently studied to identify problems, and experiments in improved methods of instruction are often conducted by educators and psychologists from the state's universities. Adequate and equitable funding for school districts is a continuing concern. Beginning in 1988, Michigan offered state residents an opportunity to invest in the Michigan Educational Trust Fund. The program guarantees tuition for an investor's child who later enrolls in a Michigan college or university.

In 1817 Judge Augustus Woodward, one of the major figures in the state's early history, conceived the idea of a "Catholepistemiad," an academy of universal knowledge. This was achieved in some measure in 1837, when the University of Michigan opened in Ann Arbor. It has since come to be widely regarded as one of the nation's finest universities, with programs on both the undergraduate and graduate levels. In 1849 a teacher-training institution, which later became Eastern Michigan University, began instruction at Ypsilanti. In 1855 the Agricultural College of the State of Michigan, now Michigan State University, was established in East Lansing. The latter shares much of the wide regard of its rival in Ann Arbor, having moved far beyond its early identification with agriculture in many areas of research and scholarship. The Michigan Technological University at Houghton, a state institution, was established in 1885 as the Michigan Mining School. In 1956 the state acquired Wayne University, a Detroit municipal university. Wayne State University, as it was renamed, has fostered much educational experimentation, and in the 1960s its campus and physical plant became landmarks in U.S. educational architecture through the designs of the American architect Minoru Yamasaki.

Michigan is also the home of widely recognized specialized schools. In 1927 the School of Music was founded in Interlochen, the forerunner of the National Music Camp that now offers instruction in music, dramatics, and related arts. The Cranbrook and Kingswood schools in Bloomfield Hills, designed by Eliel Saarinen, pioneered advanced art courses for students of high-school age.

Health and welfare. The Department of Public Health regulates the operation, construction, and licensing of health care facilities, including hospitals, nursing homes, homes for the aged, and long-term care units. Michigan devotes a major portion of its annual budget to social programs. A psychiatric hospital in Kalamazoo that received patients as early as 1859 was a forerunner of a number of other institutions caring for the needy. Since 1936 many of the state welfare services have followed a federal formula in transmitting aid to units of local government. Payments to recipients of old-age assistance, for example, and aid to dependent children, the blind, and the disabled have required special personnel at the state level, though disbursal of most funds is done locally.

Cultural life. Detroit dominated the cultural life of early Michigan, and the multifaceted backgrounds of its population gave it a cosmopolitan atmosphere. The state's first traveling theatrical companies performed in Detroit, and an opera house was erected there before the Civil War. In 1819 the Young Men's Society was organized by Lewis Cass, who led many early civic endeavours, to promote debates, lectures, and general intellectual life.

The cultural milieu

The pioneer farmers, however, had little time for cultural pursuits. The community dance that eased the strains of plowing or harvesting and the county fairs that provided a ritual summation of the year's achievements were important. Michigan's culture, then, tended to become broadly based on popular life, having many of the aspects of "mass culture." In the major parks the city of Detroit promoted band concerts and, later, symphony concerts to bring other types of music to thousands. The Detroit Institute of Arts, maintained municipally, has always emphasized exhibits that appeal to a broad public.

Michigan celebrated its sesquicentennial in 1987 with historical events as well as programs that explored contemporary issues. The Michigan Historical Commission has designated sites of historic importance, such as the location of early settlements and the first home of the Ford Motor Company. Many cities emphasize Homecoming Day, usually the anniversary date of the incorporation

of the community. Local folk festivals have been given a greater emphasis. Holland's Tulip Time Festival, held each May, has become an event of more than local importance. The annual Bavarian Festival, in Frankenmuth, appeals to others besides those of German background. Traverse City sponsors a popular National Cherry Festival. Several cities in the north commemorate the lumbering era with Paul Bunyan Days. Many ethnic groups in Detroit and other cities sponsor folk festivals that recall their cultural ties to Europe. The Museum of African-American History in Detroit is a continuing reminder of the black population's distinguished heritage.

The Detroit Institute of Arts, founded in 1885, holds one of the nation's major collections. The Muskegon Museum of Art, founded in 1911, the Kalamazoo Institute of Arts, and the Grand Rapids Art Museum have won recognition. Lansing is the home of the Michigan Historical Museum, famous for its military and Indian collections, while many county museums commemorate local history. In 1988 the state museum, state library, and state archives moved into a new building in Lansing that showcases the state's cultural resources.

The state library was founded in 1828. A state library board was created in 1936, and major public libraries are found in the larger cities. Among the outstanding special libraries are the William L. Clements Library at the University of Michigan, specializing in American history; the Burton Historical Collection of the Detroit Public Library, specializing in local history and genealogy; the Clarke Historical Library at Central Michigan University, with collections on state and regional history; and the Gerald R. Ford Museum in Grand Rapids and the Gerald R. Ford Library in Ann Arbor.

Outdoor recreation in Michigan is dominated by woods and water. As early as the 1830s, the Great Lakes were a favourite vacation lure for Eastern travelers. Today residents of southern Michigan and tourists from other areas flock to the state's shores and forests to swim, fish, hike, and hunt. Beginning in 1919, the state developed a state park system, and there are now some 90 state-operated parks and recreation areas. In addition, Michigan's 3,900,-000 acres of state forest and 25,000,000 acres of national forest constitute the largest expanse of public forestland in any state east of the Rocky Mountains.

Organized team sports began with the establishment of baseball teams in several Michigan cities during the late 1850s and early 1860s. In 1881, when the Detroit team began to compete nationally, the state's continuing love affair with the Tigers began. Football is the predominant college sport, with the heated traditional rivalry between the University of Michigan and Michigan State University being the highlight of each season. Professional football, hockey, and basketball teams from the Detroit area claim loyal fans.

HISTORY

In the 17th century the Indian population of what is present-day Michigan was estimated at between 12,000 and 15,000. The majority of these Indians, including the Ottawa, Ojibwa, Miami, and Potawatomi, belonged to the Algonquian linguistic group. A lesser number, located primarily in southeastern Michigan, were Huron and Wendat (Wyandot). The Ottawa and Ojibwa aided the French in the development and expansion of the fur trade. The Ottawa, with their commercial interests, had developed a type of canoe that was highly serviceable in the Great Lakes area. The Potawatomi Indians were identified more with the culture of the woods. The Huron were the most advanced in their agricultural practices. All the Indians of the Michigan area lived in small communities and were unfamiliar with the concept of private property.

Settlement.   Étienne Brulé, the first European to visit the area (1622), was the forerunner of numerous explorers, missionaries, and fur traders who paved the way for French control over Michigan. The oldest community in Michigan is Sault Sainte Marie, founded in 1668 at a site where in 1641 missionaries held services for 2,000 Ojibwa. In 1701 Antoine de la Mothe Cadillac established Detroit as a fur-trading centre and administrative post; it soon

became the leading French community in the entire Great Lakes area. The French, and later the English and Americans, also maintained a fort at the Straits of Mackinac.

In 1760 the French garrisons were surrendered to an English force, and in 1763, by the Treaty of Paris, England acquired jurisdiction over Canada and the French empire east of the Mississippi River except for New Orleans. Under English rule Michigan remained a part of Canada. During the American Revolution Detroit was a major supply centre for British troops, who raided the Kentucky country until 1779, when the British general Henry Hamilton was captured.

U.S. territory.   Although Michigan had been awarded to the United States in 1783, the British refused to leave Detroit and other major military posts until 1796. In 1787 it was made a part of the newly created Northwest Territory. Indian opposition to U.S. rule in the area was ended by the victory of Anthony Wayne at the Battle of Fallen Timbers, near present-day Toledo, Ohio. After 1796 the Americanizing of the regions was accomplished within a few years. Detroit became the capital of the Michigan Territory, which was separated in 1805 from Indiana. Although the first governor, William Hull, surrendered Detroit to the British early in the War of 1812, American rule was restored late in 1813 by the victory of Commodore Oliver Hazard Perry at the Battle of Lake Erie.

The real growth of Michigan Territory began soon after the war, with the new governor, Lewis Cass, encouraging settlement and promoting growth. New modes of transportation were even more significant. In 1818 steamship navigation linked Detroit and Buffalo, N.Y., inaugurating a new era in lake transportation. Cass's crude highway chain from Detroit to Chicago, Saginaw, and Port Huron helped to establish the patterns of settlement in the interior. Completion of the Erie Canal in 1825 made Detroit a leading distribution point for settlers seeking new homes in the Great Lakes area.

Statehood and growth.   Michigan was anxious for statehood so that it might undertake a more ambitious program of internal improvements. The first constitution was enacted in 1835, but statehood was delayed until 1837 by the Toledo War, a boundary dispute with Ohio. In return for relinquishing its claims to the mouth of the Maumee River, at Toledo, Michigan was awarded the western half of the Upper Peninsula as well as the eastern portion, which was historically part of the territory.

The state grew rapidly through the 1840s and '50s. Thousands of prospective agricultural settlers, including many foreign-born, established new homes in the state. Detroit and other leading cities profited, and in the 1840s the rich iron and copper resources of the Upper Peninsula became known. The state capital was moved from Detroit to the more central location of Lansing in 1847. Tension over the slavery issue resulted in the formation of the present-day Republican Party at Jackson in July 1854.

Throughout the American Civil War, Michigan made major contributions to the Union cause, losing some 14,-000 of its 90,000 men who served. A black regiment from Michigan included enlistees from many states and from Ontario. The Republican Party became dominant after the war. In the 1890s Hazen Pingree, mayor of Detroit and subsequently governor, as well as other leaders, implemented progressive legislation.

The 20th century.   Before 1900 all of Michigan's 83 counties had been settled, and agriculture, lumbering, mining, and manufacturing created a stirring economic tempo. Throughout the 20th century, however, the economy has been dominated by the automotive industry. During World War I, industrial production at all levels was intensified. The emergence of new problems connected with urban and industrial growth was recognized by features of the state's third constitution, approved in 1908.

The Great Depression was unusually severe in Michigan, the industrial products of which were not among the necessities of life; unemployment and deflation were far above the national averages. In 1932 Michigan departed from the Republican fold, thereafter becoming one of the doubtful, or swing, states, and organized labour became a powerful political and economic factor. In 1937

the United Automobile Workers became the bargaining agent for production workers at General Motors Corporation, and by the outbreak of World War II it was the dominant union in all automotive plants. During the war Detroit became known as the Arsenal of Democracy, and industrial production continued at a peak afterward to restock the nation with new cars and other war-depleted consumer goods.

Since World War II Michigan has experienced both racial polarization, as attested by the Detroit riots of 1943 and 1967, and strong efforts to equalize opportunity for minorities, the handicapped, and women. The 1963 Michigan constitution was the first in the nation to provide for a Department of Civil Rights.

The postwar years were also a period of explosive development in the suburbs and rapid expansion of the state's highway system. Inner cities, however, beginning in the late 1950s, declined in population, industries, and services. Detroit's Renaissance Center, a high-rise riverfront hotel, retail, and business development, stands as a symbol of the state's dedication to making its cities attractive and livable.

The severe recession of the late 1970s and early 1980s caused widespread unemployment, business failures, and cuts in state government services. Since then, government, business, and education have cooperated in their efforts to attract new industry, broaden opportunities for young people, strengthen the work force, and promote the expanding tourist industry.   (S.Gl./Ri.J.H.)

Minnesota

Minnesota lies near the heart of the North American continent. Its waters flow southward through the Mississippi River to the Gulf of Mexico, eastward through the Great Lakes to the Atlantic Ocean, and northward via the Red and Rainy rivers to Hudson Bay. Minnesota, which became the 32nd state on May 11, 1858, received its name from the Dakota (Sioux) word for the Mississippi's major tributary in the state, which means "Sky-Tinted Waters." St. Paul is the state capital.

The state's 84,402 square miles (218,601 square kilometres) are bounded on the north by the Canadian provinces of Manitoba and Ontario, on the east by Lake Superior and Wisconsin, on the south by Iowa, and on the west by South and North Dakota. A small extension of the northern boundary makes Minnesota the most northerly of the 48 coterminous U.S. states. This irregularity is the result of a general boundary agreement with Great Britain before the area had been carefully surveyed.

Minnesota is a land of extensive woodlands, fertile prairies, and innumerable lakes, more than 12,000 of which are larger than 10 acres (four hectares) in area. The nearly 5,000 square miles of inland fresh water are a dominant feature of the Minnesota life-style. Its climate is continental, with cold winters and warm summers. About one in four Minnesotans is at least part Scandinavian, but Germans constitute the single largest ethnic group in the state. In the past the Minnesota economy has been dominated by the production and processing of its timber, iron ore, and agricultural resources. While agriculture remains important, the state's economy has become much more diversified since World War II, with the rapid growth of specialized manufacturing and services.

PHYSICAL AND HUMAN GEOGRAPHY

The land. *Relief and drainage.* Minnesota's elevations range from 602 feet (184 metres) above sea level at Lake Superior to 2,301 feet (701 metres) at Eagle Mountain, about 12 miles from Lake Superior's north shore. Most of Minnesota has been covered by glaciers several times, and the land's surface has been shaped by the alternate freezing, thawing, and movement of those glaciers. Prominent reminders are the rolling farmlands, thousands of lakes, steep hillsides, and flat glacial lake and outwash plains. Minnesota's rich prairie soils developed on the finely ground mineral materials left by the retreating glaciers. The majority of Minnesota's lakes are located in the areas of glacial moraine, where glaciers deposited hills of sand

Effects of the glaciers (margin note)

and gravel. Lakes of more than 100 square miles in area are Red Lake, Mille Lacs Lake, Leech Lake, and Lake Winnibigoshish; Lake of the Woods and Rainy Lake are shared with Canada. With some 160 miles (260 kilometres) of coastline, Minnesota shares Lake Superior, the largest freshwater lake in the world, with Ontario, Michigan, and Wisconsin.

The largest glacial lake plain (more than 100,000 square miles) was formed by Lake Agassiz, which held the meltwaters as the latest glaciers retreated northward some 8,000 years ago. The southern part of the former lake bed lies along the Minnesota–North Dakota border and is known as the Red River valley. Red Lake and Lake of the Woods, as well as Lake Winnipeg in Canada, are all remnants of this huge body of glacial meltwater. Its southward drainage created the wide valley of the Minnesota River, the flow of which eventually reversed as ice blockage to the north melted. In northeastern Minnesota there are stream valleys and deep, clear lakes that were scoured by glaciers from the granite bedrock. Extreme southeastern Minnesota was the only part of the state to escape glaciation. There, streams have cut their way through layers of limestone, leaving extensive caverns beneath the surface and steep, rocky bluffs rising high above the valleys.

Soils. The most fertile soils in Minnesota are in the grasslands of the south and west, rich in organic matter and high in soluble minerals. Soils that have formed beneath the coniferous forest in northeastern Minnesota are light coloured, acidic, and low in organic matter, while those formed in the hardwood areas are intermediate in colour and natural fertility.

Climate. Great variations of temperature and growing season occur not only seasonally but also from one part of the state to another. This reflects the fact that Minnesota stretches from the edge of the subarctic forest to the heart of the Corn Belt. During June and July the sun shines more directly over southern Minnesota than over the equator, while in the north frost is possible in any month.

In July average daily maximum temperatures range from 85° F (29° C) in southern Minnesota to 70° F (21° C) along the shore of Lake Superior. Average daily January highs range from 25° F (−4° C) in the south to 15° F (−9° C) in the north; minimums are from 5° F (−15° C) to −5° F (−21° C). The average frost-free periods vary from less than 90 days in parts of the north to more than 160 days in parts of the south. The average annual precipitation ranges from more than 30 inches (750 millimetres) in the southeast to less than 20 inches in the northwest. Average seasonal snowfall varies from less than 40 inches in the western part of the state to more than 70 inches in the extreme northeastern tip. Many parts of Minnesota have continuous snow cover for at least 90 days, from about mid-December to mid-March.

Plant and animal life. Minnesota stands astride one of the major physical geographic boundaries in the world, the sharp transition from forest to prairie in the heart of North America. The natural vegetation of Minnesota may be divided into three general categories: needleleaf forests, hardwood forests, and tallgrass prairie. The needleleaf forests originally occupied the northeastern third of the state and included pine, spruce, and fir, with tamarack in the bog areas. A belt of hardwoods extends from southeastern Minnesota northeasterly to the Canadian border, passing through the Twin Cities and lying immediately to the south and west of the coniferous forest. The hardwood forest is known as the big woods and averages some 40 to 80 miles in width. It consists primarily of oak, maple, and basswood, with ash, elm, cottonwood, and box elder along the stream valleys. South and west of the hardwood forests lies the tallgrass prairie.

Belts of forest and prairie (margin note)

Mammals commonly found throughout the state include deer, foxes, raccoons, porcupines, minks, weasels, skunks, muskrats, woodchucks, and squirrels. Black bears, moose, elk, wolves, coyotes, lynx, bobcats, otters, and beavers are found almost entirely in the north. Common year-round birds include chickadees, woodpeckers, grosbeaks, nuthatches, cardinals, sparrows, and jays. Favourite migratory songbirds include robins, orioles, thrushes, meadowlarks, and red-winged blackbirds, the state's most

common bird. Migratory waterfowl include ducks, geese, gulls, coots, herons, and egrets. The common loon is the official state bird. In addition to ducks and geese, other game birds include grouse, quail, partridge, wild turkeys, and imported ring-necked pheasants. Important raptors include hawks, eagles, owls, and ospreys.

The walleye is designated as the state fish and is the most popular object of anglers. Other important game fish include the northern pike, muskellunge, bass, lake trout, crappie, sunfish, and eelpout. Brown and rainbow trout thrive in many streams. The deep, cold waters of Lake Superior contain lake trout, whitefish, coho and chinook salmon, steelhead, smelt, herring, and ciscoes. The timber rattlesnake is found in several southeastern counties.

Settlement patterns. To serve Minnesota's growing agricultural, forestry, and mining activities in the 19th century, a network of towns emerged across the landscape. In the latter half of the 20th century many of the smaller communities atrophied, while the larger communities extended their influence over wider areas. In general, population densities are greatest in the east and south, declining toward the north and west.

During a century of white occupancy, virtually all of the prairies were cultivated. The coniferous forestlands, mostly cut by 1920, have become covered again by aspen, birch, and jack pine, while much of the big woods has been cleared for crops and pasture. Minnesota reached its peak in cultivated farmland in 1945. Since then the agricultural frontier has retreated, and farms have been abandoned in the less fertile areas in north central and northeastern Minnesota. The big woods area has become primarily a dairying area. Within 100 miles (160 kilometres) or so of the Twin Cities, dairying has intensified, but, beyond that, dairying has declined in importance. The prairie areas of southern and southwestern Minnesota have a characteristically Corn Belt crop and livestock agriculture.

The people. The New England Yankees of English, Scottish, and Irish descent who first settled Minnesota were entrepreneurs who helped establish the institutions and many of the traditions that remain important in Minnesota. The first major immigrant groups in the latter half of the 19th century were Germans, Swedes, and Norwegians who cut the trees, built the railroads, and became the farmers, tradesmen, and professionals.

German settlers dominated the push up the Mississippi, continuing into the central and south central parts of the state. Norwegian settlers moved westward across the southern tier of counties, forming the major ethnic group in west central Minnesota and the Red River valley. The major areas of Swedish settlement are in several counties immediately north of the Twin Cities and scattered locations in west central and northwestern Minnesota. Substantial numbers of Finns live in northeastern Minnesota, Poles in southeastern and central Minnesota, Bohemians south of the Twin Cities area, Irish across the south, French and French Canadians just north of the Twin Cities and in northwestern Minnesota, Dutch and Flemish in parts of southwestern Minnesota, Icelanders in northwestern Minnesota, and Danes, Welsh, and Swiss in scattered pockets.

Each ethnic group brought with it its religious traditions. Central and south central Minnesota are heavily Roman Catholic, reflecting the German, Polish, and Bohemian populations. Other Germans, as well as most Scandinavians, are Lutheran. Many ethnic clusters have retained a degree of homogeneity in the rural areas. They have been sources of population movement to urban areas, but they have attracted few in-migrants to alter the original stock.

By 1890 most of the good agricultural land had been claimed. Thus, most immigrants who arrived during the next few decades sought a livelihood in the Twin Cities area or on the iron ranges, where employment opportunities were expanding. The Twin Cities area, in particular, grew rapidly as the state's major centre for cultural contact and variety. These later immigrant groups included Finns, Italians, Slovakians, Croatians, Serbs, Greeks, Jews, Ukrainians, Russians, American blacks, and Hispanics, as well as a continued flow of northern Europeans.

The American Indian population is primarily Ojibwa, about one-half of whom live in the Twin Cities; most

The ethnic blend

of the remainder live on reservations in rural Minnesota. Slightly more than 1 percent of the state population is black, about 90 percent of whom live in the Twin Cities. Hispanics constitute a sizable community. Since the mid-1970s, refugees from Vietnam, Laos, and Kampuchea have been added to the Twin Cities area population.

The economy. The economic growth of early Minnesota was related closely to the exploitation of its primary natural resources: soils, iron ore, and timber. These activities, in turn, stimulated the growth of such ancillary activities as railroads, processing of natural resources and agricultural products, and services. During the late 1960s and early '70s, activities based on natural resources, as well as railroads and associated manufacturing, began to decline. Agriculture, however, is still Minnesota's largest industry.

Agriculture. Agriculture in Minnesota falls into four categories that are closely related to climate and soil type. Minnesota's most valuable and productive farmland lies across the southern quarter of the state, mostly an area of dark, fertile prairie soils and hot, humid summers. Corn (maize), which occupies the greatest acreage, is fed to cattle and hogs; soybeans are the major cash crop. In the Red River valley the growing season is shorter and the humidity is lower than in southern Minnesota, making small grains and specialty crops more profitable. Major crops are wheat, barley, sugar beets, sunflowers, potatoes, and flax.

Dairying dominates the hilly big woods region from southeastern to west central Minnesota. Milk and milk products are the major sources of farm income in this region, with feed crops being important. Soybeans and potatoes are grown as supplemental cash crops. Large-scale turkey production is important in several localities. In northeastern Minnesota, where soils are thin and acidic, agriculture is much less important than in other parts of the state.

Mining. Iron ore accounts for more than 90 percent of the value of all minerals produced in Minnesota. The Mesabi Range, the largest of three iron ranges in the state, began production in 1892 and at its peak produced one-fourth of the world's iron ore. By the late 1950s, however, most of the high-grade natural ores of the Mesabi had been depleted. A process was developed at the University of Minnesota for extracting iron from the abundant but low-grade taconite rock. To encourage the heavy capital investment required, the voters of Minnesota approved a constitutional amendment in 1964 that guaranteed the taconite industry a tax-free period of 25 years. This resulted in a brief revitalization of the iron ore industry in Minnesota. In the 1980s, however, low-cost foreign steel reduced American steel production, and lower-cost foreign ores replaced Minnesota taconite in American steel mills.

Other mining activities in Minnesota include granite and limestone quarrying and sand and gravel extraction. There are no coal, oil, or natural gas resources in Minnesota, and geologic formations are such that the discovery of these minerals is highly unlikely.

Industry. Minnesota's earliest industries facilitated exploitation of the state's natural resources with the manufacture of implements, machinery, tools, and hardware. Ancillary activities included processing, packaging, transporting, financing, insuring, and providing the necessary infrastructure for these industries, all of which developed into a complex interdependent economic network. The agricultural servicing industries have diversified into a wide range of consumer products and have grown into major corporations with worldwide markets. The major financial institutions, insurance companies, and merchandisers likewise have diversified and expanded their market areas.

The major changes in Minnesota's economic structure have come from high-technology and non-resource-based industries. Other growing sectors of the economy are printing and publishing, health care, scientific instruments, industrial chemicals, and recreational equipment.

The lumbering industry declined rapidly after the turn of the century as the pine forests were depleted and much of the natural regrowth of aspen and birch had limited commerical value. In the latter half of the 20th century, however, Minnesota's forest industry has been revitalized with the growth of the wood pulp and waferboard indus-

Iron extraction

tries. Pine, balsam, and spruce are harvested for pulpwood, while aspen, once considered a "weed" tree, has become the preferred species for waferboard manufacturing and accounts for about 70 percent of the commercially harvested wood in Minnesota. From the 1880s to about 1920, Minneapolis was known as "the mill city," producing more flour than any other city in the world. After 1920 Buffalo, N.Y., surpassed Minneapolis because of its proximity to eastern markets. While flour is no longer produced in Minneapolis, the major milling companies retain their headquarters there.

The milling industry

Transportation. The movement of people and goods in Minnesota and the upper Midwest is centred on the Twin Cities area. Regional and transcontinental rail and highway systems radiate outward from the Twin Cities, tying the towns and hamlets into one interdependent network. The rail system of northeastern Minnesota brings iron ore and taconite products for transshipment by boat at the Lake Superior ports of Duluth and Superior. Wheat from the Dakotas and Montana also has been an important product transshipped from rail to boat at Duluth. Since the opening of the Great Lakes waterway to ocean vessels in 1959, products of the upper Midwest are carried directly to locations throughout the world.

River transportation was the first important mode for the movement of both people and goods in many parts of the state. Barges on the Mississippi carry bulk products to and from the major inland ports at St. Paul and Minneapolis. Carried upstream are such bulk products as coal, oil, and salt; grain, sand, and gravel are transported downstream.

The Twin Cities area, also the air hub of the upper Midwest, is served by several commercial airlines. The Minneapolis–St. Paul International Airport is supplemented by a satellite network of additional airports around the state.

Administration and social conditions. *Government.* Minnesota's first state constitution was ratified by Congress at the time of statehood in 1858. In 1974 this document was restructured and reworded to improve its utility without altering its meaning. In cases of constitutional law the original document is the final authority.

Minnesota's constitution provides for an executive branch comprising a governor, a lieutenant governor, a secretary of state, an auditor, a treasurer, and an attorney general. These six state officials are nominated with political party designation and elected by statewide ballot. There are more than 100 administrative departments and independent agencies, boards, commissions, and other bodies.

The state's bicameral legislature consists of a 67-member Senate and a 134-member House of Representatives that meet in regular session in odd-numbered years. Senators are elected to four-year terms, representatives to two-year terms.

The judicial branch comprises the Supreme Court, district court, probate court, county courts, municipal courts, and justices of the peace. Nine justices constitute the Supreme Court; each is elected for a six-year term.

The state's 87 counties range in size from 155 square miles of land area to 6,092 square miles and in population from less than 5,000 to about 1,000,000 people. Counties and municipalities provide most of the local governmental services, but townships assume some authority for planning and zoning and for maintenance of public works, parks, and hospitals. A number of school districts have been consolidated, and special districts have been established to provide for waste management, water supply, fire protection, parks, airports, soil and water conservation, and other interjurisdictional needs.

The Twin Cities Metropolitan Council, the members of which are appointed by the governor, is responsible for the development of certain areawide services that local government is unable to provide, including sewage and water systems, transportation, and major land uses. It plays a coordinating and regulatory role among the more than 350 local governmental jurisdictions within the Twin Cities area.

Minnesota politics

Politics and social issues. From the beginning, Minnesota politics has been characterized by recurring waves of protest and reform that have spawned such national groups as the Grange, the Greenbackers, the Antimo-

nopolists, the Farmers Alliance, the Populists, the Prohibitionists, and the Nonpartisan League. Each of these movements brought about social reforms and influenced the major political parties. Both major Minnesota parties in the late 20th century are amalgams from this tradition. The Democratic-Farmer-Labor Party was formed in 1944 between the more traditional Democrats and the reformist Farmer-Labor Party. The Independent-Republican Party was created in an effort to attract more of the substantial but diverse independent vote in Minnesota.

The political environment emerged from the traditions of the original New Englanders who brought their town-meeting form of government to this new frontier. That foundation was reinforced by the Scandinavian and German immigrants, with their ambition and high regard for education. Government has always been accepted as the legitimate means for public decision making in Minnesota, and business has played an important role as a strong participant in public decisions.

The traditions of citizen involvement can be seen in the many neighbourhood and community organizations and ad hoc issue-related groups in the state and in the relatively large number of Minnesotans of national political prominence. Minnesota has been a leader in such national movements as those to guarantee the rights of women, homosexuals, and American Indians.

Education. Approximately 90 percent of Minnesota's elementary and secondary students attend public schools. School districts vary widely in size and resources, with the larger and wealthier generally located in the major urban centres. Small rural school districts have often consolidated—or collaborated without consolidating—in order to provide a full range of curriculum opportunities and essential services. On average, more than half of local school district revenues come from the state, with support ranging widely based on local needs. Minnesota ranks among the top states in the proportion of its students graduating from high school, in standard test scores for high school graduates, and in the proportion attending higher educational institutions.

The University of Minnesota was established in 1851, with its main campus in Minneapolis and a smaller campus in St. Paul. Smaller branches of the university are located in Duluth and Morris, with four-year programs, and in Crookston and Waseca, with two-year programs.

The state university system operates campuses in several locations. One of these, Metropolitan State University, in the Twin Cities, is a "college without a campus" that utilizes diverse physical facilities throughout the area to bring higher education to the neighbourhoods. In addition, the state operates large systems of community colleges and of post-secondary vocational-technical schools. Several private four-year colleges supplement the public system.

Health and welfare. Minnesota is high among the states in the quality of health and welfare services. The state's high standard of general medical services, its extensive children's health and welfare programs, and its innovative approaches to health maintenance, drug- and alcohol-abuse treatment, and care for the elderly have all been praised.

The Twin Cities and Rochester serve as national health care centres. The Mayo Clinic in Rochester has served patients from around the world since the late 19th century. The University of Minnesota Hospitals in the Twin Cities area has been a pioneer in medical research, while numerous hospitals across the state provide an effective network of medical care.

Cultural life. Cultural life in Minnesota is highly diversified and seasonal. Many activities are oriented toward the outdoors; they include swimming, boating, canoeing, camping, hunting, and fishing. Popular winter sports include downhill and cross-country skiing, snowmobiling, and ice fishing; ice hockey is most commonly played indoors. St. Paul celebrates winter with its annual Winter Carnival, while Minneapolis celebrates summer with its Aquatennial. The State Fair is a major summer attraction of the Twin Cities. Community festivals are abundant throughout the state year-round.

Prevalence of outdoor life

for the state, the Twin Cities area serves as the centre of cultural institutions. The best-known musical organizations are the Minnesota Orchestra, which was formed in 1903 as the Minneapolis Symphony Orchestra, the St. Paul Chamber Orchestra, and the Minnesota Opera Company. Civic orchestras and colleges and universities throughout the state make substantial contributions to the arts within their communities and regions.

The Twin Cities area has several resident professional theatres. The best known is the Tyrone Guthrie Theatre Company, formed in 1963. The Children's Theatre Company is nationally recognized as one of the finest of its kind. The Minnesota Dance Theatre is the most prominent resident dance company in the Twin Cities.

The Minneapolis Institute of Arts, the Walker Art Center, and the Minnesota Museum of Art are among the most important art museums in the state. Other major museums are the Minnesota Science Museum, the Bell Museum of Natural History, the Minnesota Historical Society, the American Swedish Institute, and the Planetarium of the Minneapolis Public Library.

Sinclair Lewis and F. Scott Fitzgerald are celebrated Minnesota-born authors. Minnesota's pioneer days are remembered in the books of Laura Ingalls Wilder and Ole Rölvaag.

HISTORY

Until the middle of the 19th century, two major Indian tribes occupied what is now Minnesota: the Ojibwa (Chippewa) in the north and east and the Sioux (the popular name for the Dakota) in the south and west. Between the time of European exploration and statehood, the Ojibwa occupied the forested areas of the state and pushed the Sioux southward and southwestward onto the prairie. Indians of tribes from as far away as the Appalachians and the Rocky Mountains met in a sacred place of peace in southwestern Minnesota to quarry a hard red rock that was used for making peace pipes; today this area is preserved as the Pipestone National Monument.

European settlement. Investigation of the Kensington Stone, found in west central Minnesota in 1898 and bearing inscriptions allegedly made by Norsemen who penetrated the continent in the 14th century, has proved it to be a forgery. The earliest verifiable Europeans in the area were 17th-century French explorers who were searching for a Northwest Passage. The first white settlement was

(margin: Diversity of Indian tribes)

made where the French fur traders known as voyageurs had to leave Lake Superior to make a nine-mile portage around the falls and rapids of the Pigeon River. Before the American Revolution this outpost, known as Grand Portage, was the hub of an enormous commercial empire stretching 3,000 miles from Montreal to Canada's northwestern wilderness. It was the inland headquarters of the North West Company, which trapped beaver and marketed their pelts, and the meeting place each July and August for fur buyers and sellers. Grand Portage became U.S. territory after the Revolution but did not pass into American hands until 1803, when the North West Company moved 30 miles up the Lake Superior shore to Fort William (now Thunder Bay), Can. Today Grand Portage is a national monument, and part of the fur traders' route east of International Falls has been preserved as Voyageurs National Park.

The first permanent U.S. settlement was at Fort Snelling, a military outpost established in 1819 overlooking the junction of the Mississippi and Minnesota rivers; the site has been restored as a state park. Immigration into the region was slow during the first half of the 19th century, but, once the value of the vast forestlands of northern and central Minnesota was realized, lumbermen from New England led a large wave of permanent settlers.

Territory and state. That part of Minnesota east of the Mississippi River was part of the original Northwest Territory, which came under the jurisdiction of the Ordinance of 1787; the part of the state that lies west of the Mississippi was part of the Louisiana Purchase in 1803. Minnesota became a territory in 1849, its boundaries at that time reaching as far west as the Upper Missouri River, but most of its approximately 4,000 white settlers were located in the Fort Snelling–St. Paul area in the eastern part of the territory. The lumber industry developed rapidly, and major sawmills were soon built at Stillwater, on the St. Croix River, and at the Falls of St. Anthony, on the Mississippi River. The two villages at the falls were merged in 1872, with the village of St. Anthony on the east bank being absorbed into the larger and more aggressive city of Minneapolis on the west bank.

Ties with Canada were important during the early settlement period. In 1811 a colony had been established in the lower Red River valley, near modern Winnipeg. As there was little effort to mark and enforce the international boundary, goods and people flowed unhindered between the two countries. Immigrant groups that came into Minnesota via this route were Canadians of English, Scottish, Scotch-Irish, and French extraction. Because it was much easier to supply this area from Minnesota than from eastern Canada, supplies were shipped from St. Paul via St. Anthony to Fort Garry and other Red River valley settlements. As a result of this lucrative trade, people from both sides of the border sought U.S. annexation of western Canada, known as Rupert's Land. This received little support in Congress from Southern states concerned with maintaining the sectional balance. Great Britain effectively undercut any Canadian desire to defect to the United States with the British North America Act of 1867, which brought about the formation of the Dominion of Canada, giving Canada self-governing authority. The efforts of Minnesota expansionists ended in 1870 when Canada established the province of Manitoba and sent troops to Winnipeg.

When Minnesota became a state in 1858, its boundaries were cut back from the Missouri River to the Red River. In 1861, Minnesota was the first state to send volunteers for the Civil War. Meanwhile, attention at home concerned the Sioux Uprising, one of the bloodiest Indian wars in the country's history. The Sioux Indians who had not been driven from the state were confined to small reservations. The federal government had forced the sale of some of these lands, reversing earlier treaty agreements. Driven further by crop failures and starvation, the Sioux attacked isolated farmsteads. In only a few weeks more than 500 civilians, soldiers, and Indians were killed.

The most rapid period of settlement in Minnesota was during the 1880s, when homesteaders rushed into western and southwestern Minnesota. In the same period, lumber-

(margin: Sioux Uprising)

ing was at its peak and flour milling, using power provided by the St. Anthony falls, was becoming important. Both Minneapolis, as the lumber, milling, and retail centre, and its neighbouring city of St. Paul, as the transportation, wholesaling, finance, and government centre, tripled in population during the 1880s. The rivalry between the two cities became particularly intense after the census of 1880, when Minneapolis surpassed St. Paul in population.

Commercial iron ore production began in Minnesota in 1884 at Soudan, on the Vermillion Range. After the huge iron reserves of the Mesabi Range were discovered at Mountain Iron in 1890, large-scale production began, and the population along the Mesabi Range and in the Lake Superior port cities of Duluth and Superior grew rapidly during the next two decades. Most of the valuable pine, balsam, and spruce in central and northeastern Minnesota had been cut before 1900, after which time the lumbering industry declined rapidly. Wood products remained important in northern and northeastern Minnesota.

Adaptation and change. Since permanent settlement took hold in central North America, Minnesota has evolved from a frontier outpost to an integral part of the national and global economy. With its traditions of political activism, it has sought to influence those conditions it could and to adapt creatively to those it could not.

Mechanization of the resource-based economy has meant that fewer people could produce more. As a result, rural populations have declined since about 1920, and people increasingly have sought employment opportunities in the urban centres, particularly the Twin Cities area. The automobile, as successor to the railroad, has strongly influenced this pattern of development because people can now travel great distances with ease.

The attitude toward the environment has shifted from one of exploitation to more skillful management of the forests, water, soil, and wildlife. Remaining pristine wilderness areas, such as the Boundary Waters Canoe Area in northeastern Minnesota, are now guarded by many with a loving passion. The large areas of the state given over to parks, forests, and wildlife refuges attest to the high priority given to environmental management in Minnesota.

During the 20th century the development of Minnesota's economic focus from the regional and national level to that of the world has made its citizenry more conscious of the global community. Increasing exposure to global markets has made the Minnesota economy more vulnerable to fluctuations in international economic conditions and has required new forms of adaptation. Even the sometimes bitter parochial rivalry in the past between St. Paul and Minneapolis has mellowed with the acknowledgment of their common interests and competitors, and, as the core cities have become vastly outpopulated by their suburbs, a growing sense of metropolitan and state identity has developed.   (N.C.G.)

Missouri

Near the centre of the coterminous United States, Missouri is the meeting place of the timberlands of the East and the prairies of the West, of the cotton fields of the South and the cornfields of the North. It has represented the political and social sentiments of a border state since its admission as the 24th member of the Union on Aug. 10, 1821. The question of its admission as a slave or free state produced in Congress the Missouri Compromise (1820), which regulated the spread of slavery in the western territories.

Missouri was the westernmost state of the nation until the admission of Texas in 1845, and for decades it served as the eastern terminus of the Santa Fe and Oregon trails. For the West, St. Louis, Missouri's largest city, long was the closest contact with the more settled society and the culture of the East, and for the East the state had a reputation as the chief gateway to the West.

The Missouri River cuts across the state from Kansas City in the west, through Jefferson City (the state capital) in the centre, to just above St. Louis in the east, where the river joins the Mississippi. (Missouri was the name of a group of Indians who lived in the area; the French gave the name to the river, and it was later transferred to

the state.) With the exception of Tennessee, Missouri has more neighbouring states than any other U.S. state. To the north lies Iowa; across the Mississippi River to the east, Illinois, Kentucky, and Tennessee; to the south, Arkansas; and to the west, Oklahoma, Kansas, and Nebraska. The area of Missouri is 69,697 square miles (180,516 square kilometres). Slightly more than half of Missouri's population lives in the two major cities, St. Louis and Kansas City, and their surrounding counties.

Missouri ranks high in the degree of urbanization and the amount of industrial and economic activity, though it maintains a vigorous and diversified agriculture. The rugged Ozark Plateau is a scenic beauty, and many lively folk traditions persist among its communities. Missouri retains numerous conservative characteristics of the rural life that predominated prior to the 1930s. Its nickname, the Show-Me State, suggests a tradition of skepticism regarding change. In Missouri the Democratic Party does not necessarily represent more liberal political philosophies than does the Republican, and the latter has made inroads into the traditional Democratic orientation. Continuing low tax bases prevent the elaboration of social services, a problem felt most acutely in the two major cities, which have had an increasing loss of wealth to the suburbs, coincident with greatly expanding needs of the cities.

PHYSICAL AND HUMAN GEOGRAPHY

The land. *Relief.* North of the Missouri River, in the glaciated section, Missouri's landscape is characterized by gently rolling hills; open, fertile plains; and well-watered prairie country. South of the Missouri, except in the extreme southeastern corner of the state and along the western boundary, the land is rough and hilly, with some deep, narrow valleys and clear, swift streams. It is a region abounding with caves and extraordinarily large natural springs. Much of the land is 1,000 to 1,400 feet (300 to 425 metres) above sea level. Near the western border, however, the elevation rarely exceeds 700 to 800 feet, and in southeastern Missouri, a part of the alluvial plain of the Mississippi, it is less than 500 feet. The St. Francois Mountains in the eastern Ozarks exhibit igneous granite and rhyolite outcroppings, while the rest of the state is underlain by sedimentary rocks, mainly limestones, dolomites, sandstone, and shale. Missouri is tectonically stable except for the southeastern portion, where small earth tremors occur. The possibility of another devastating earthquake of a magnitude comparable to those centred at New Madrid in 1811–12 cannot be discounted.

Drainage and soils. Drainage and soil conditions permit farming in all of Missouri's counties, although the Ozark Plateau only supports livestock farming because of the region's thin soil. Northern Missouri is generally well drained, much of it covered by rich glacial and loessial soils. The alluvial soils in the bottom lands along the many rivers and streams, which some soil experts believe to be the most extensive in the nation, also add to the farming potentiality. Except for the rivers that flow generally southeasterly into the Mississippi, many through Arkansas, the Missouri drains most of the state.

Missouri's many lakes have been created by damming rivers and streams. The Lake of the Ozarks is a large artificial lake, with an area of approximately 60,000 acres (24,300 hectares) and a shoreline of 1,375 miles (2,213 kilometres). Most have been built primarily to furnish hydroelectric power and to prevent flooding, but they provide Missouri with excellent recreational resources. There also are many natural springs, some of them among the largest in the world.

Climate. Missouri is susceptible to the influences of cold Canadian air; of warm, moist air from the Gulf of Mexico; and of drier air from the southwest. Although winds are variable throughout the year, summer winds generally blow from the south and southwest and winter winds from the north and northwest. Rainfall, usually sufficient for crops, varies from around 34 inches (864 millimetres) in the north and northwest to 50 or more inches in the extreme southeast. About one-third of it falls from April to June. Heavy snows are unusual, most snow occurring between December and February. Missouri lies

Margin notes (left column):
Tapping the ore beds

Adaptation and change

Role in U.S. history

Margin note (right column):
Ozark Plateau

in "Tornado Alley," the zone of maximum occurrence, and has an average of 27 tornadoes annually. Maximum January temperatures range from about 36° F (2° C) in the north and northwest to 48° F (9° C) in the southeast. The extreme northwest usually has cooler summers than the southeast, but summer temperatures well above 100° F (38° C) may occur in any part of the state.

Plant and animal life.   Originally, about two-thirds of Missouri was forested, and the remainder was covered with prairie grasses. The river bluffs and valleys of the Ozark Plateau have a wide variety of unusual plants, including fameflower, royal catchfly, Trelease's larkspur, coneflower (*Rudbeckia maxima*), gayfeather, and fringed poppy mallow. Trelease's larkspur and coneflower are found in the wild in Missouri. Elk, deer, bison, and bears once were plentiful, as were such smaller animals as beavers, otters, and mink. After settlement and the development of agriculture, most of the larger animals, with the exception of deer, disappeared, and animals with valuable fur were trapped until near extinction.

Settlement patterns.   Missouri's regions reflect the ethnic, religious, and political persuasions of the residents. The "Bootheel" in the extreme southeast was settled by planters from the South and was appended to Missouri at the time of statehood through the great influence of one planter; it is the centre of Missouri's cotton culture, which has declined due to cotton disease and is being replaced by the cultivation of soybeans, wheat, grain sorghum, and rice. The Ozark Mountains area, whose rugged terrain is unsuited to extensive agriculture, has been among the poorer regions of Missouri, but it constitutes one of the great tourist attractions of the state. "Little Dixie" is a block of counties that lies generally north of the Missouri River and extends westward along its banks to the middle of the state. It was initially settled by persons sympathetic to the South. Some of the finest examples of antebellum residences are found there. South of Little Dixie, on the bluffs and uplands south of the Missouri River and west of St. Louis, is a concentration of German settlements, known traditionally as the "Missouri Rhineland." In the western part of the state, north and east of the Missouri River, is historic "Mormon Country." There, followers of Joseph Smith settled around 1831, first at Independence and subsequently in other counties, until they were driven out by hostile neighbours. In the centre of the state, around Boonville, Franklin, and Columbia, is the "Boone's Lick Country," where the frontiersman Daniel Boone and his sons moved from Kentucky to make salt.

Human settlement has altered Missouri's landscape significantly. Only one-third of the state remains forested, mostly on the hills and slopes of the Ozarks. Nearly all of the prairie land has been brought under cultivation. The damming of streams has produced numerous lakes and reservoirs, and in the southeast, drainage systems have converted former swamps into one of the state's richest agricultural regions. Agriculture in the state traditionally has been characterized by family-owned farms, but, as elsewhere in the nation, the number of farms has been decreasing, while acreage and productivity per farm have increased. Urbanization also has reduced the amount of agricultural land. Although urban settlements are scattered throughout the state, Kansas City and St. Louis are Missouri's important centres of commerce and manufacturing and the nuclei of large metropolitan areas that extend into Kansas on the west and Illinois on the east.

The people.   After the early French settlers, immigration came largely from states to the east and northeast, as well as from the South, with the implantation of its type of economy and society in the Bootheel and in Little Dixie. The first immigrants from abroad—particularly Germans, Irish, and English—came in great numbers after 1820. By 1860 large groups of Germans had settled in Missouri, mainly in St. Louis and just to the west, while many Irish had settled in the city. Between 1860 and 1890 the immigration from Ohio, Illinois, and Indiana exceeded that from the South, while an increasing number of immigrants from Germany arrived, settling mostly in urban centres. Subsequently, St. Louis and Kansas City attracted sizable communities of Italians and Greeks as well as Poles and

Jews. By World War II more than 20 different European ethnic groups had settled in rural Missouri.

While Missouri's population has grown modestly, people continue to leave the state, a pattern more characteristic of heavily rural or economically less developed states. The northward migration of many blacks from the rural South has altered the racial composition of the population. From 1940 to 1960 the white population increased by 11 percent, whereas the nonwhite population increased 62 percent. By the late 20th century blacks made up more than 10 percent of the state's total population, largely concentrated in St. Louis and Kansas City.

It is not unusual that a crossroad state should exhibit great religious diversity. The Roman Catholic church, which was dominant until the Louisiana Purchase, remains powerful, particularly in the St. Louis and Kansas City areas. After 1803 the chief Protestant denominations as well as many smaller sects were established. Baptists and Methodists predominate, and various Pentecostal groups are well represented throughout the state. Jewish communities have flourishing congregations in the larger cities.

The economy.   Although agriculture has remained important as an income-producing activity, services, manufacturing, and wholesale and retail trade have forged ahead since World War II. Missouri has become the commercial and industrial leader among all its adjacent states except Illinois and Tennessee. In some types of manufacture, particularly in the production of aerospace and transportation equipment—including automobile assembly—Missouri ranks among the leading states in the nation. Recreation and tourism have surpassed agriculture in economic importance. Much of this growth has been in the larger towns and cities and near the large Ozark lakes.

The state Department of Economic Development includes several divisions and commissions that have had a significant influence upon the state's economic development. Local chambers of commerce and private financial groups also have stimulated economic growth.

Workers in Missouri generally have enjoyed the benefits of an expanding economy, but income per capita is below the national average. Unions have had great influence in increasing the salary levels of teachers, clerical workers, and those in trades and crafts. In spite of favourable comparisons with other states in income and revenue, Missouri ranks near the bottom in terms of state tax revenue per capita. As a result, it has suffered from a lack of sufficient revenue to meet the needs and services that modern governmental agencies are expected to provide.

Resources.   The state's variety of resources includes lead and iron ore, barite, limestone, timber, and hydroelectric power. Mineral-rich Missouri leads the nation in lead production, and deposits of lead and zinc, as well as iron ores, continue to be discovered. Iron production, however, has ceased, and lead production has decreased because of declining demand. About two-thirds of the forest stand lies in the Ozarks, and since the 1950s industry has made increasing use of these resources. The acreage of many marginal farms in the Ozarks is being given over to recreation, one benefit of which is their return to forest.

Agriculture and industry.   A wide range of crops are grown, including soybeans, the state's most valuable crop, wheat, corn, cotton, rice, and tobacco. More than half of the state's total farm income derives from the sale of animals and animal products, mainly cattle, hogs, and dairy products. In parts of northern Missouri the combined number of cattle and hogs amounts to more than nine times the number of human inhabitants.

Manufacturing is led by the production of aerospace and transportation equipment, followed by the processing of food and the production of chemicals.

Finance and trade.   Missouri ranks high among the states in commercial and savings and loan bank assets. Federal reserve banks are located in St. Louis and in Kansas City, and the regional offices of the Internal Revenue Service in Kansas City serve much of the Midwest. Kansas City and St. Louis have always been important trading and commercial centres for large regions reaching into neighbouring states, and they rank among the foremost grain and cattle markets of the nation. Farm-related

The "Bootheel," the Ozarks, and other regions

Patterns of immigration

Minerals

products and automotive sales are the leading sources of revenue for wholesale and retail trade, while business demands predominate the services sector.

Transportation. The major flows of traffic within the state are from the east to west along the Missouri valley and southward along the Mississippi. Missouri is served by several interstate highways. Its railroads are linked with most of the nation's major trunk lines, and St. Louis, Kansas City, and Jefferson City are served by Amtrak passenger service. Since 1910 the gradual abandonment of competing parallel lines and short lines built by mining and lumbering companies has led to a considerable **River** reduction in Missouri's railroad mileage. The Mississippi **transpor-** and Missouri rivers, providing more than 1,000 miles of **tation** navigable waterways within the state, connect waterborne traffic with New Orleans. St. Louis and Kansas City are regional air hubs.

Administration and social conditions. *Government.* Missouri is governed under its fourth constitution, ratified in 1945, but the basic structure of government has remained constant since the first constitution of 1820. Governors are elected for four-year terms and may succeed themselves. They have the power of "item veto," by which they may strike individual provisions from any appropriation bill, except those for public school support or payments on the public debt. Legislative power is vested in the General Assembly, composed of the Senate and the House of Representatives. The House has 163 members, elected for two-year terms, and the Senate has 34 members elected for four-year terms. Each senator represents equivalent population units, whereas each county has at least one representative, regardless of its population. During the early 1960s voters in 42 rural counties had nearly 10 times as many representatives as citizens living in St. Louis, St. Louis county, and Kansas City and surrounding Jackson county. Redistricting was completed in 1971 to establish equality of representation.

The judicial system is similar to that of most states, with a Supreme Court as the highest tribunal. Below it are the Court of Appeals and 44 circuit courts. An unusual feature of Missouri's judicial system is a method of selecting judges by merit, known as the Missouri Plan and adopted **Missouri** by several other states. Under the plan the governor fills a **Plan** vacancy in the court by appointing one of a three-member panel selected by a nonpartisan judicial commission. The appointment must be confirmed in a separate nonpartisan ballot in the first general election after the judge has been in office 12 months. The plan applies only for the Supreme Court, the Court of Appeals, and circuit courts in metropolitan St. Louis and Kansas City. In counties outside the two large metropolitan areas, circuit judges and associate circuit judges are elected by voters in partisan elections. Political partisanship is still a consideration in the governor's selection of appointees and in the selection of commission members.

The city and the county are the most important units of local government. The state has 114 counties plus the city of St. Louis, which is independent of surrounding St. Louis county. Counties are administered by a county commission consisting of three elected commissioners. Counties with a population of more than 85,000 are permitted to adopt their own charters. Missouri was the first state in the nation to permit cities to adopt their own governing charters, and there are now more than 20 cities across the state with home-rule charters. Most Missouri cities have the mayor–council form of government.

Missouri voters tend to favour Democratic candidates, but they have elected Republican governors and returned Republican majorities to the General Assembly on a number of occasions. Both parties contain liberal and conservative factions. The Democratic Party is somewhat stronger in the two large metropolitan centres, while the Republican Party is strongest in southwestern Missouri and in the rural northern counties.

Education. Since 1945 many small school districts have consolidated into fewer large ones, and school enrollments and revenues have declined significantly since the early 1970s. Missouri has lagged behind other states in support of public education, while at the same time efforts to de-

segregate schools in St. Louis and Kansas City have been an additional financial burden.

Higher education has expanded both in the public and **Colleges** private institutions. The University of Missouri has cam- **and** puses in Kansas City, St. Louis, and Rolla, in addition **universities** to the main and oldest campus in Columbia. There are also several state colleges plus Lincoln University, founded originally for blacks but now enrolling whites. Among the private institutions are Washington University and Jesuit-run St. Louis University, both in St. Louis. Financial support of higher education consistently has been inadequate.

Health and welfare. The state Department of Social Services and the Department of Mental Health, both established in 1974, provide services for the ill and the indigent. In cooperation with federal agencies, St. Louis and Kansas City have undertaken massive urban-renewal programs to help relieve inner-city problems.

Though costs of living have risen, especially in the larger population centres, income per capita also has risen. Pockets of poverty exist in depressed rural areas and in city slums, but Missouri generally has not had the severe poverty of states with more heavy industrialization or a greater amount of subsistence farming. The disparities between rich and poor are greatest in and around St. Louis and Kansas City. Because the metropolitan areas of St. Louis and Kansas City cut across state lines, their problems of metropolitan government and management are compounded.

Cultural life. Diversity characterizes Missouri's cultural milieu, from the centres of fine art, music, and theatre along the St. Louis–Kansas City axis to the folk culture and native crafts of the Ozarks.

The state has furthered cultural opportunities through the Missouri State Library, established in 1946, and the Missouri State Council on the Arts, created in 1965. The state library has been responsible for the rapid growth of county and regional libraries. The larger cities have their own library systems. The council on the arts has stimulated communities to expand their cultural resources.

From the state's beginnings, the arts have flourished in Missouri. In painting, George Caleb Bingham and Thomas Hart Benton have been preeminent. If expatriate poet T.S. Eliot, a St. Louis native, is disqualified, Mark Twain remains Missouri's most distinguished literary figure, world-renowned for his immortalization of mid-19th-century life in Hannibal and along the Mississippi. There are schools of art and design in St. Louis and Kansas City, and music flourishes in both cities. St. Louis' Gateway Arch, designed by Eero Saarinen, is a spectacular example of the diverse architectural styles in evidence throughout the state.

The Ozarks abound in folk traditions, tales, and ballads. This region was settled primarily by pioneers from the **Folk** southern Appalachians, who brought with them traditional **traditions** songs and ballads, some of which were brought over from **and crafts** England and Scotland in the 17th century. Native crafts once practiced out of necessity by the pioneers have begun to flourish again in response to the interest of tourists and also because of recognition of the intrinsic merit of the objects made. Quilting, woodworking, basketmaking, and pottery are among some of the most important crafts, and their development is encouraged through the Missouri Federation of Arts and Crafts.

Besides its universities and colleges, Missouri has outstanding cultural institutions, among them the St. Louis Symphony Orchestra, the second oldest U.S. civic orchestra and one of the major musical ensembles in the nation. In Kansas City the Nelson-Atkins Museum of Art owns one of the finest collections of Asian art in the Western Hemisphere, and the Linda Hall Library has an outstanding scientific collection. Independence is the home of the Harry S. Truman Library and Museum. Fulton, where the British leader Winston Churchill made his famous "Iron Curtain" speech, has a collection of Churchilliana in the Church of St. Mary the Virgin, Aldermanbury, whose stones were reassembled there after its destruction in the World War II bombings of London.

High school, college, and professional sports are popular. Kansas City is the home of the professional baseball Royals and the football Chiefs. St. Louis is the home of

the baseball Cardinals. Increased leisure time and mobility have stimulated an enormous interest in recreation, and Missouri has developed a superb system of state parks and historic shrines and memorials that are attractive to residents and visitors alike. Numerous man-made lakes afford fishing and waterskiing, while the clear, cool rivers of the Ozark Plateau offer pleasure to canoeists, fishers, and campers. The Mark Twain National Forest provides ideal habitat for game animals and songbirds. The Current and Jacks Fork rivers are protected and managed as wild and scenic waterways by the Ozark National Scenic Riverways.

The Missouri Press Association, established in 1867, has had an important effect upon the development of the press in the United States. It was responsible for establishing the world's first school of journalism at the University of Missouri and for founding the State Historical Society of Missouri, with the largest membership in the nation. There are numerous local newspapers and journals; newspapers of national distinction include the *St. Louis Post-Dispatch,* made famous by Joseph Pulitzer, and the *Kansas City Star* and *Kansas City Times.*

HISTORY

Before the coming of European explorers the land that was to become Missouri was the home of a diverse group of Indian tribes whose mounds and other remains dot the state. One of the tribes was called the Missouri.

Exploration and settlement. The recorded history of the region dates from the settlement of some French lead miners and hunters at Sainte Genevieve, on the western bank of the Mississippi, in about 1735. At some distance from its original site, Sainte Genevieve remains the oldest continuously inhabited white settlement in Missouri. Some 30 years later, Pierre Laclede, a French fur trader from New Orleans, founded St. Louis. At the time of the Louisiana Purchase in 1803, most of the 10,000 residents of the region were French settlers from the Illinois country, but some Americans had come from Kentucky and Tennessee, which, with Virginia, were the major immediate sources of settlers in following decades.

Statehood, controversy, and war. The "pull of the West" solidified Missouri's position as a land of passage after it achieved statehood as a slave state in 1821 under the Missouri Compromise of 1820. Migrants bound for Texas outfitted in Missouri, and later thousands of people

(margin: French settlements)

heading west poured through Saint Joseph, Independence, Westport Landing, and the City of Kansas (Kansas City).

Although slavery had become well established in the Missouri Territory, both on the plantations of transplanted Southerners and in French lead-mining ventures, the Abolition movement drew increasing support, particularly after statehood was granted. In challenging the traditional Southern institution, new arrivals from the North and from Europe challenged also the principle of states' rights. The emotional nature of the controversy gave rise in some instances to mob violence against abolitionists, including the Mormons who gathered in Missouri in the 1830s. Laws were enacted to prohibit teaching any black to read or write and to prevent any free black from entering the state. The case of the Missouri slave Dred Scott, who sued for his freedom on the grounds that his master had for a time moved him into the free state of Illinois and the free territory of Wisconsin, resulted in a Supreme Court decision (1857) that made slavery legal in all the territories.

The 1850s were years of increasing dissension, worsened by the Kansas–Nebraska Act of 1854 that set slave- and free-state advocates at one another's throats for control of those adjoining territories. Missouri already was moving toward a free-state economy, however, and the state stayed within the Union during the Civil War. Missourians fought on both sides, but those in the Union army outnumbered those in the Confederate army by nearly 4 to 1. Conflict occurred in the state, much of it guerrilla warfare along the Kansas border. After the war, Confederate sympathizers were dealt with harshly; overall, however, Reconstruction was not as severe as in the Deep South.

(margin: Role in the Civil War)

The 20th century. The continued growth of Missouri in the late 19th and early 20th centuries was celebrated in the famous St. Louis Exposition in 1904. The state remained heavily rural and agricultural, however, until the Great Depression of the 1930s and World War II brought about vast movements of people into the cities.

Three important developments have shaped the economy of Missouri since World War II: the shift from agriculture, mining, and lumbering to manufacturing, particularly of durable goods, and services; large investments in public and social services, highways, and rural electrification; and population growth, particularly near the large reservoirs and in the peripheries of St. Louis, Kansas City, and Springfield. Rural areas of Missouri have attracted many new plants that employ a small number of workers, but two-thirds of the manufacturing employment remains concentrated in the St. Louis and Kansas City metropolitan areas. Small towns have changed rapidly, their relative success depending to a large degree on geography and transportation. Some towns near large cities have grown as they have been brought into the commuting zone by improved highways, but most villages have suffered economic stagnation as the rural population has declined and the remaining residents shifted their commercial support to the larger towns.   (E.J.W./M.D.R.)

Nebraska

One of the west central states of the United States, Nebraska during the first 60 years of the 19th century was primarily a water and land route to the rich trapping country to the north and west and the settlement and mining frontiers of the mountain and Pacific regions. With the development of railroads after the Civil War and the consequent immigrations, however, the excellent soils of Nebraska were plowed, and its grasslands gave rise to a range cattle industry. As a result, the state has been, almost since its admission to the Union on March 1, 1867, as the 37th state, a major producer of food commodities.

Rivers were important to Nebraska's geography and settlement. The Missouri River, a major highway to the trans-Mississippi West in the early 19th century, forms the eastern boundary with Iowa and Missouri and about a fourth of the northern boundary with South Dakota. The name Nebraska is derived from an Indian word meaning "flat water," a reference to the Platte River, which served as a magnet for urban clusters across the state. The river is formed by the confluence of the North and

(credit: Matt Bradley)

Canoeing on the Eleven Point Scenic River, in Mark Twain National Forest, on the Ozark Plateau in southern Missouri.

South Platte rivers, both of which rise in Colorado on the southwest, although the North Platte swings northward through Wyoming, on the west, before entering Nebraska.

Creation of Nebraska territory

The southern boundary with Kansas was established when the two territories were created by the Kansas–Nebraska Act in 1854, legislation that heightened the sectional hostilities that exploded into the Civil War. A majority of Nebraskans today live close to the Missouri and Platte, leaving much of the state's 77,355 square miles (200,-350 square kilometres) lightly populated. Lincoln, in the southeastern part of the state, is the capital.

Agriculture is basic to Nebraska's economy, but only one-tenth of its labour force is employed directly in farming or ranching. Economic conditions have had a direct bearing on the state's political life, including a brief period of protest through the agrarian-oriented People's (Populist) Party during the 1890s. Although Nebraska traditionally has been a Republican stronghold, the Democrats also have been an important political force.

PHYSICAL AND HUMAN GEOGRAPHY

The land. *Relief.* Nebraska comprises parts of two physiographic regions, the till plains of the Central Lowland (in the eastern third) and the Great Plains.

The elevation rises from a minimum of 840 feet (256 metres) above sea level in the southeast to a maximum of 5,426 feet (1,654 metres) near the Colorado–Wyoming boundaries. Much of the land is gently rolling prairie, although the river valleys, much of south central Nebraska, and a large portion of the panhandle district are flatlands. The Sand Hills country of north central and northwestern Nebraska is a vast, treeless, grass-covered region that comprises almost one-fourth of the area of the state.

Drainage. Nebraska lies within the Missouri River drainage system; the Platte, the major Nebraska tributary, joins the Missouri south of Omaha. Although shallow and unnavigable, the Platte is vital to the state's irrigation. The Elkhorn River enters the Platte west of Omaha, and the Loup River, formed by three tributaries flowing out of the Sand Hills, also discharges into the Platte. The Republican and Big Blue rivers flow through southern Nebraska, emptying into the Missouri in Kansas via the Kansas (Kaw) River. The Niobrara, a swift-moving stream that rises in the high country just west of the Wyoming border, flows across extreme northern Nebraska. The state also has a vast supply of groundwater that has made possible the extensive development of well irrigation.

Soil types

Soils. All of Nebraska's soils are excellent for agriculture. The prairie soils of the southeast and the humous soils of central and northeastern Nebraska are highly suitable for general farming. South of the Platte and west of the prairie soil area, the soil is best suited to small-grain production. Winter wheat adapts to the soil and marginal precipitation of western Nebraska. The wind-deposited soil of the Sand Hills, because of limited precipitation and the danger of erosion, is suited solely to cattle grazing. With many small lakes and luxuriant grasses, the Sand Hills area is a superb rangeland. The alluvial soils of the Missouri and Platte river valleys and the valleys of smaller streams are outstanding for raising corn (maize) and other crops.

Climate. Hot winds from the southwest often push summer temperatures in Nebraska above 90° F (32° C) and sometimes above 100° F (38° C). Average July temperatures range from 73° F (23° C) in the panhandle to 78° F (26° C) in the southeast. In the winter northwestern winds often bring in Arctic air masses from Canada, and temperatures commonly fall well below 0° F (−18° C). Low-pressure systems, moving out of the southwestern states, sometimes bring great blizzards to the state and pose a danger to travelers and stock raisers. Average January temperatures vary from 24° F (−4° C) in the panhandle to about 20° F (−7° C) in the northeast. The average growing season is 168 days in the southeast and 133 days in the panhandle. The average annual precipitation varies from 33 inches (840 millimetres) in the southeast to less than 16 inches in the extreme west. Since a minimum of 20 inches is usually considered necessary for normal crop production, approximately one-half of Nebraska may be considered semiarid. Irrigation is used extensively in east-

ern and central Nebraska and is essential to certain types of agriculture in the western part of the state.

Plant and animal life. A wide variety of grasses originally covered Nebraska's prairies, and the slopes of the river valleys were well covered with deciduous trees. Cottonwood, elm, and some oak and walnut are found along the bluffs of eastern Nebraska, while conifers grow in the Wild Cat and Pine Ridge highlands and the Niobrara valley. The Nebraska National Forest in west central Nebraska resulted from a human effort to bring trees to the barren plains. Until their near extermination at the hands of whites, bison roamed widely over the Nebraska plains. Some of these animals remain in their natural habitat on the Fort Niobrara National Wildlife Refuge, near Valentine. Antelope and deer are also native to the state, as are prairie dogs, coyotes, jackrabbits, skunks, and squirrels. Migratory birds and pheasants are common.

Settlement patterns. According to federal law, the land was surveyed into townships, six miles (10 kilometres) square and containing 36 sections; the section, comprising 640 acres (259 hectares), was the basic unit of land. This gridlike survey system remains a basic feature of Nebraska's landscape. Most of the towns and villages were located close to rivers, streams, and timber. A number of them developed as railroad terminals, but changing patterns of transportation brought about growth for some communities and stagnation or oblivion for many others.

Section land unit

Economics, geography, and politics created certain sectional distinctions within Nebraska. The placement of the capital of Nebraska Territory at Omaha so enraged the people south of the Platte that they sought annexation to Kansas, and in 1867 the state capital was moved to Lincoln, south of the Platte. Both Lincoln and Omaha emerged as major regional hubs, but, because these cities are located at the eastern end of the state, western Nebraskans often regard Denver, Colo., as their major service centre.

The people. In addition to the Americans who came to Nebraska, large numbers of European immigrants settled in the state during the late 19th century. From 1866 to 1877 the Nebraska State Board of Immigration employed an agent in Europe to recruit settlers. The Burlington and Union Pacific railroads made much greater efforts than did the state government in this direction. The largest immigrant group was the Germans, who in 1890 numbered 72,000; immigrants from the Scandinavian countries (particularly Sweden), Bohemia, and the British Isles also made important contributions to the settlement of Nebraska.

As a result of the European influx, Nebraska was not molded in the traditional Anglo-American form that had characterized much of the nation's earlier development. Large numbers of Roman Catholics from Bohemia, Germany, and Ireland and Lutherans from Germany and Scandinavia gave diversity to the religious and secular life of Nebraska. Although the linguistic identity of the non-English-speaking groups faded away, other aspects of their diverse cultural heritage have survived.

With the opening of the territory to settlement in 1854, the federal government created a reservation for the Omaha Indians in northeastern Nebraska, part of which subsequently was made into a reservation for the Winnebago people, recently displaced from Wisconsin. Some of Minnesota's Santee Sioux also went to a reservation in northeastern Nebraska. (The Omaha-Winnebago and the Santee Sioux reservations still exist.) In the 1870s the Oto-Missouri, Pawnee, and Ponca peoples, after living on reservations in Nebraska, were removed to Indian Territory (now Oklahoma). By 1878 the Dakota (Sioux) had given up their agencies in northwestern Nebraska and were located on reservations just over the border in Dakota Territory (now South Dakota). In the early 20th century the implementation of federal legislation permitting reservation Indians to hold land titles, rather than fostering the benefits of private ownership by native peoples, often resulted in quick and unseemly transfers of real estate to land-hungry whites. About one-third of Nebraska's native people now live in Omaha and Lincoln. Other Indians are concentrated on the reservations and in areas of the Nebraska panhandle.

Blacks came to Nebraska early in the history of the state. Most settled in Omaha, which by 1900 had a black population of more than 3,400, a figure that by the late 20th century had increased more than 10-fold. Blacks were concentrated north of downtown Omaha in an area that increasingly became characterized by the social and economic problems common to the ghettos of other large cities. This core of the black community has declined markedly in population, however, as many blacks have moved to adjacent neighbourhoods. Racial disturbances in Omaha in the 1960s emphasized the need for improved economic opportunities and better police–community relations. Omaha's black community has long had representation in the legislature.

The most striking trend in Nebraska's demography has been the steady decline of the population of the rural areas and the marked growth of the cities and their suburbs. Urban growth has been stimulated by the mechanization of agriculture, which brought about the working of more land by fewer persons, decreases in the number of farms, and increases in average farm sizes. Similarly, most small towns, reliant upon the local farm trade, have continued to lose population, a condition undoubtedly hastened by a modern highway system that has enlarged the trade areas of the cities. Rural schools, hospitals, and other institutions have been forced to adjust accordingly. Although employment opportunities have been diminishing in rural Nebraska, there has been an increase in the number of work opportunities in manufacturing, notably in the Platte valley with its excellent highway transportation, as well as in the state's major cities.

The economy. Nebraska's economic development is heavily dependent upon private investment from outside its borders. The state Department of Economic Development was established in 1967 to bring new industry to Nebraska. In addition, a law passed in 1987 provides tax incentives for the development of business and industry. Wholesale and retail trade and other services, manufacturing, transportation, and agriculture are the major sources of income. The state generally has been conservative in labour matters and ranks low nationally in the percentage of unionized nonagricultural workers. Nebraska has a right-to-work law that forbids compulsory union membership.

Agriculture. Nebraska remains a leading agricultural producer. The principal crops are corn, sorghum, soybeans, hay, and wheat. Nebraska ranks high among the states in the production of corn for grain and in wheat, sorghum, dry edible beans, and sugar beets, as well as in the number of cattle, hogs, and pigs. Potatoes are also a significant crop.

Industry. Food processing is the most important industrial activity of the state in terms of value added by manufacture. Other leading industrial activities include the manufacture of machinery and chemicals and allied products, printing and publishing, and the production of primary and fabricated metals and electrical, electronic, and transportation equipment.

Crude petroleum accounts for more than half of the value of the state's mineral extraction. Nebraska also produces some natural gas, as well as significant amounts of cement, lime, sand, gravel, crushed stone, and clay. Additional quantities of natural gas, however, are imported to serve the commercial, industrial, and residential needs of the state. All electrical utilities are publicly owned, and consumer rates are among the lowest in the nation.

Nebraska, and Omaha in particular, is known as a major centre of the American insurance industry. Tourism is essential to the livelihood of the state and ranks third behind agriculture and manufacturing in economic significance.

Transportation. Nebraska is located on some of the most important arteries linking the East and West. Within the state traffic in the east tends to flow toward Omaha, Lincoln, and Sioux City, Iowa, and toward the cities in the Platte valley. Much of western Iowa lies within the trading area of metropolitan Omaha.

Nebraska has a good network of modern highways. The most important route is Interstate Highway 80, which carries heavy traffic east–west across the state. Several railroads also operate in the state, and both Omaha and Lincoln are served by Amtrak. Omaha is an important port for commercial barge traffic on the Missouri. Air carriers serving Nebraska include both major national lines and those that provide "feeder" service to the smaller communities of the state.

Administration and social conditions. *Government.* Nebraska functions under a frequently amended constitution dating from 1875. Since 1937 it has had a one-house legislature whose members are elected without political-party affiliation—the only such legislative body in the nation. The 49 members of the legislature, or "Unicameral," are popularly elected for four-year terms following primary and runoff elections in their districts, which are equally proportioned by population. The Unicameral meets for sessions of 90 legislative days in odd-numbered years and 60 days in even-numbered years.

The nonpartisan feature of the legislature has many critics, who charge that the lack of political parties in the Unicameral results in a lack of leadership in that body. Indeed, nonpartisanship may have enhanced the importance of lobbyists in the legislative process.

The governor, the chief executive officer, is elected for four years on a partisan ballot and is limited to two consecutive terms. The governor is responsible for the operation of some 20 administrative departments and is an ex officio member of various boards and commissions. The governor must present a detailed budget to the state legislature, which needs an affirmative three-fifths vote to appropriate more funds than recommended by the governor or to override a gubernatorial veto. Other elected state officers also run on partisan ballots.

Nebraska's court system, reorganized in 1972, comprises the Supreme Court, with seven justices, and 48 judges of district courts. In addition, there are conciliation courts, county courts, municipal courts in Omaha and Lincoln, and juvenile courts, as well as a Workers' Compensation Court. Nebraska has adopted the merit system for selecting judges. Judicial nominating commissions, chosen by the governor and the Nebraska State Bar Association, compose lists of nominees to fill vacancies on the bench. The governor then appoints one of the nominees to fill a particular position. After three years judges run for retention on a nonpartisan ballot in a general election and must run in similar elections every six years thereafter.

County government is vested in boards of supervisors or commissioners of from three to seven members, who like other county officials are elected on partisan ballots. The city manager and mayor–council forms of government are used in Nebraska's cities, and governmental authority in villages is vested in elective boards of trustees.

Nebraska Territory was the creation of a Democratic administration in Washington, D.C., and Democrats dominated Nebraska politics until the Civil War. The 30 years after 1860 were marked by Republican preeminence in Nebraska, but the political ferment during and after the 1890s brought an end to one-party rule. Although a slight majority of Nebraska's voters are registered Republicans, Democrats often are elected to office.

Education. Since the 1960s, state aid for education to local governments has increased greatly, and the number of school districts has been cut drastically in order to make more efficient use of educational facilities and programs.

There are more than 30 institutions of higher education in Nebraska; about one-half are private schools, and the rest are state-operated four-year colleges and publicly supported technical community (junior) colleges. The University of Nebraska (established in 1869) is the largest educational institution in the state and is composed of three semiautonomous campuses—the original campus in Lincoln, a campus in Omaha, and the medical school, with facilities in Omaha and Lincoln. Graduate degree programs are offered at the University of Nebraska and Creighton University (Omaha), both of which offer programs in medicine, law, and dentistry, and at state colleges in Chadron, Kearney, Peru, and Wayne.

Health and welfare. Nebraska's programs of public assistance include medical aid and financial assistance for dependent children, the aged, and the blind. Federal fund-

ing provides more than half of Nebraska's public-assistance expenditures. Although welfare funding has steadily increased, the average monthly public-assistance payments in Nebraska are below the national average.

The state maintains a system of mental hospitals and other specialized health, correctional, and care facilities. Omaha ranks as a medical centre of national significance.

Cultural life. In less than two generations Nebraska was converted from a wilderness inhabited by a small number of Indians to a settled commonwealth of more than 1,000,000 residents. This conquest was an important achievement of the 19th century, and it is natural that the cultural contributions of Nebraska, like those of other Western states, are centred on this frontier experience.

Such Nebraska authors as Willa Cather, Mari Sandoz, and Bess Streeter Aldrich were among those who wrote perceptively of life on the plains and won national audiences. The relationship of the pioneers to a capricious natural environment, the life-styles and interaction of settlers of diverse social and ethnic backgrounds, and the plight of the Indians were among the important themes of these writers. The poet John G. Neihardt wrote with feeling of Plains Indian life; he also re-created the adventures of the explorers of the 19th-century West. In the early 1970s his narrative *Black Elk Speaks* achieved national recognition some 40 years after it had originally been published.

The Nebraska State Historical Society, organized in 1878, continues to make important contributions to an understanding of life in Nebraska and the West. In 1960 the University of Nebraska Press launched the paperback Bison Series, reprints of early and modern works on the American West, including histories, collections of lore from Indian and white settlers, and other important documents, many of which had been out of print.

The Joslyn Art Museum in Omaha and the University of Nebraska's Sheldon Memorial Art Gallery in Lincoln contain the state's major collections in the visual arts. The performing arts have flourished in Nebraska, both in the development of local musical, theatre, and dance groups and through performances by touring artists of national stature.

Various folk observances, such as the Czech Festival at Wilber, are reminders of the diverse origins of the people of Nebraska. Ogallala, a roaring cow town during the 1870s and '80s, relives its colourful past with its Front Street festivities held each summer. Each October the Knights of Ak-Sar-Ben (Nebraska spelled in reverse), an Omaha civic organization founded in 1895, crown a king and a queen of Quivira. This event commemorates the search through the plains in 1541 of the Spanish explorer Francisco Vázquez de Coronado for the legendary Seven Golden Cities of Cibola and the Kingdom of Quivira. The University of Nebraska football team has attained national prominence, and few subjects hold the attention of Nebraskans as do the fortunes of the Cornhuskers. The benefits derived from the citizens' enthusiasm for football are important in the state's economy. Recreational areas include several state parks, the Nebraska National Forest, and the Oglala National Grassland.

Folk and historical festivals

HISTORY

Various prehistoric peoples inhabited Nebraska as early as 8000 BC. In the 19th century semisedentary Indian tribes, most notably the Ponca, Omaha, Oto, and Pawnee, lived in eastern and central Nebraska. The west was the domain of the nomadic Brulé and Oglala Sioux, but other tribes, such as the Arapaho, Comanche, and Cheyenne, also roved the area.

Exploration and settlement. Nebraska was on the periphery of the North American empires of France and Spain, but in 1763 Spain won title to the trans-Mississippi region. Spanish efforts to develop Indian trade in upper Missouri brought little success, and international politics led to the transfer of the region, including Nebraska, to France in 1800. Three years later the United States acquired this vast area as part of the Louisiana Purchase.

In 1804 the Lewis and Clark Expedition visited the Nebraska side of the Missouri River and conducted the first systematic exploration of the area. Shortly thereafter

a vigorous fur trade developed along the Missouri, but Nebraska was primarily a highway to richer fur-trapping areas to the north and west. During the 1840s the Platte valley became another highway as thousands of settlers moved westward.

Much interest soon developed in Nebraska and in the Platte valley as a potential railroad route to the Pacific. Frontier land speculators in western Missouri and Iowa anticipated great financial gains if the Nebraska country, part of the large Indian domain between the Missouri River and the Rocky Mountains, were opened for settlement. With the adoption of the Kansas–Nebraska Act in 1854, the federal government extended political organization to the trans-Missouri region. Originally the Nebraska Territory comprised 351,558 square miles, but by 1863 the organization of the Colorado, Dakota, and Idaho (including the states of Montana and Wyoming) territories had reduced Nebraska almost to its present dimensions.

Roles of speculators and railroads

Much of the economy of the early Nebraska settlements along the Missouri River was based on land speculation. Agriculture soon began to develop, however, and some river towns became important transfer points for freight and passengers going west. The completion of the Union Pacific Railroad in 1869 and the railroad construction that followed contributed to the development of the state.

Statehood. After Nebraska's admission to the Union in 1867, and despite an economic depression and a grasshopper plague, the population increased from about 120,000 to more than 1,000,000 by 1890. The Indian resistance on the frontier was broken during these years, and settlement extended westward into the panhandle of the state. During the 1880s Omaha became an important industrial and meat-packing centre, and Lincoln became prominent as the state capital and as the seat of the University of Nebraska. In the late 19th and early 20th centuries Nebraskans struggled over the issues of woman suffrage and prohibition of alcoholic beverages, revealing cultural differences between old-stock Americans and recent European immigrants.

In the 1890s Nebraska's farmers, afflicted with poor crop prices, high transportation costs, and economic depression, expressed their protest through the People's Party. Although the Populist movement was short-lived, it invigorated the political life of the state. Prosperity returned by 1900 and continued for two decades. Through the 1920s Nebraska's agriculture again was beset with mediocre marketing conditions, which were in part responsible for the failure of 40 percent of the state-chartered banks from 1921 through 1930. With the advent of the Great Depression of the 1930s the state's economy deteriorated further, necessitating massive federal assistance.

Impact of economic cycles

In 1933 the state legislature authorized the creation of public power and irrigation districts. Loans from the U.S. government enabled these districts to construct hydroelectric and irrigation projects in the Platte and Loup river valleys. A public agency later purchased the private electric power companies outside the Omaha area, and in 1946 the Omaha Public Power District acquired the local private power company. Nebraska thus became the first state with complete public ownership of electrical generating and distribution facilities, an ironic fact in view of its reputation for political conservatism.

World War II brought economic recovery and other changes. Fort Crook, south of Omaha, became the site of a huge aircraft plant. In 1948 this location, renamed Offutt Air Force Base, became the headquarters of the Strategic Air Command, which stimulated the growth of the greater Omaha area.

One of Nebraska's chief resources is a vast supply of groundwater. Tapping this resource for irrigation rose dramatically in the mid-1950s. The introduction of centre-pivot sprinkler devices in the 1970s constituted a fundamental change in the history of Nebraska agriculture because it made possible the cultivation of lands that previously could not be irrigated. The impact of centre-pivot irrigation is evident in the circular pattern now overlaid on much of the traditional "checkerboard" landscape.

Centre-pivot irrigation

The heavy utilization of groundwater plus the possibility that more water could be diverted from the upper reaches

Farm situated in the corners of the circles produced by centre-pivot irrigation in the cornfields southwest of North Platte, Neb.
Chester Peterson, Jr

of the Platte system in Colorado and Wyoming have made Nebraskans more sensitive to the need to conserve their water resources. In addition, they have become more aware of the danger of groundwater contamination by chemical fertilizers and related products.

In the 1960s, changes in the meat-processing industry caused a sharp decline in Omaha's status as a meat-packing centre. However, economic diversification brought continuing prosperity to Omaha, which has remained Nebraska's principal industrial centre. Since the 1950s other Nebraska communities have risen in prominence in manufacturing activities. Lincoln, with its strong emphasis upon education and government, has also diversified economically and has become one of the most dynamic urban areas of the north central region.   (H.A.D.)

North Dakota

Officially classed as one of the seven western north central states, North Dakota was admitted to the Union as the 39th state on Nov. 2, 1889. It is a land of generally clear skies, seemingly endless grain farms, and vast cattle ranches. The state is rural, agricultural, and sparsely populated. Its terrain rises through three regions from east to west, incorporating parts of the two major physiographic provinces that separate the Appalachian and the Rocky Mountain systems. The state's name derives from the Dakota division of the Sioux Indians who inhabited the plains before the arrival of Europeans.

North Dakota, bounded by Canada on the north, Minnesota on the east, South Dakota on the south, and Montana on the west, has an area of 70,702 square miles (183,119 square kilometres). The largest city is Fargo, and Bismarck is the centrally located capital.

Among the last regions of the American frontier to be settled, the area that became the state of North Dakota experienced comparatively little of the fighting, lawlessness, and gold-rush excitement that give other frontier areas a colourful and sometimes lurid history. Instead, the region developed first as the home of hunting and farming Indian peoples, later as a trading area for white fur traders and for steamboats working the upper Missouri River from St. Louis, and then as a rich farming land for white settlers. The cool, subhumid climate of its location made it ideal for spring wheat and for cattle ranching. The area subse-

quently developed a way of life dependent on outside centres of population, industry, and economic power. With adaptation to the environment, however, North Dakotans also developed constructive reactions to those conditions that underlie their state's dependency.

PHYSICAL AND HUMAN GEOGRAPHY

The land. *Relief.* The eastern half of North Dakota lies in the Central Lowland, which stretches westward from the Appalachians, while the western half lies in the Great Plains, which extend to the Rocky Mountains. The state is like three broad steps rising westward: the Red River valley lies 800 to 1,000 feet (250 to 300 metres) above sea level, the Drift Prairie from 1,300 to 1,600 feet, and the Missouri Plateau from 1,800 to 2,500 feet. The highest point in the state is White Butte, at 3,506 feet (1,069 metres). The Central Lowland portion comprises the Red River valley, a flat, glacial lake bed extending from 10 to 40 miles (16 to 64 kilometres) on either side of the Red River of the North, and the Drift Prairie, a rolling country covered with glacial drift. On the west the Missouri Escarpment separates the Drift Prairie from the Great Plains. The North Dakota portion of the Great Plains is known as the Missouri Plateau. East and north of the Missouri River it is covered with a thick layer of glacial drift. The Altamont Moraine in this area, which is one of the principal flyways for migrating wildfowl, has numerous potholes, lakes, and sloughs. Saline Devils Lake, remnant of a shallow glacial sea and the largest natural body of water in the state, has undergone remarkable and not altogether explained variations in level since the 1880s. It is the subject of many local, particularly Indian, legends. Like the Drift Prairie, this region has a young drainage system, there being few rivers in areas once covered by the great ice sheets of the geologically recent past.

About two-fifths of the state is drained by the systems of the Red and Souris rivers, whose waters flow eventually into Hudson Bay. The Missouri Plateau and the James River system form a part of the drainage of the Missouri, which drains almost two-fifths of the state and flows into the Mississippi and thence into the Gulf of Mexico. West of the Missouri River the landscape has been shaped by running water that has carried away as much as 1,000 feet of sedimentary deposits. In some places, especially along the Little Missouri River, it has carved spectacular cliffs,

buttes, and valleys that form a landscape known as the North Dakota Badlands.

Climate.   North Dakota's location at the centre of the North American continent gives the state a continental climate: hot summers and cold winters, warm days and cool nights in summer, low humidity and low precipitation, and much wind and sunshine. The western part of the state has lower humidity, lower precipitation, and milder winters than the eastern half. For the state as a whole, the average annual precipitation is about 17 inches (430 millimetres). In July the average daytime high temperatures range from 88° F (31° C) in the south to 82° F (28° C) in the north. In January the average highs range from 26° F (−3° C) in the southwest to 10° F (−12° C) in the northeast. The growing season in North Dakota varies considerably, from 134 days at Williston, in the northwest, to 104 days at Langdon, in the northeast.

Original grasslands
Plant and animal life.   Before settlement, 95 percent of the state was covered by grass, low precipitation, drought, and grass fires having inhibited tree growth. Long-lived perennial grasses begin to grow early in the spring, produce seed quickly, and go into a dormant state in drought. They protect the soil from erosion and provide food for grazing animals. The heavy grass cover of the Red River valley and the Drift Prairie formed black soils, while the lighter grass cover of the Missouri Plateau formed lighter, thinner, dark brown soils. The grassland was a natural habitat for great herds of buffalo and antelope. Belts of timber and brush along the rivers provided homes for animals such as white-tailed deer, elk, and bear. The remaining small buffalo herds are protected in parks, and, in arable parts of the state, croplands have replaced the virgin prairie.

Settlement patterns.   The regions are reflected to some degree in the character of the people. The inhabitants of the Missouri Plateau tend to be more Western in their manners and dress, whereas those of the Red River valley are more Eastern. The Drift Prairie is a transition zone in this respect, a function it serves also in relation to climatic patterns and plant and animal distribution.

North Dakota is a land of large farms and ranches; its vast, open country has few fences. There is beauty in the great fields and pastures, the big sky, the endless view of flat or rolling prairie with the black earth of the plowed land, the green blanket of a new crop, or the yellow cover of ripened grain. The clean, dry air and the bright sun give a wholesome look to the land, but the large holdings, which average more than 1,200 acres (480 hectares), make the countryside seem lonely and almost uninhabited.

With the diminishing of farm population, characteristic of the second half of the 20th century, many small towns have also disappeared, while in others businesses and houses stand empty. The larger cities provide a sharp contrast, with their new stores, public buildings, and housing developments and their air of vigour and prosperity. The sparsity of population affects not only the state's economy but also the character of the people, who tend to be friendly, helpful, and straightforward. Distances create isolation, but the electronic media and improved transportation have reduced many of its effects.

The people.   When white traders reached what was to become North Dakota, several Indian peoples lived in the region: Mandan, Hidatsa, and Arikara along the Missouri River, Chippewa and Cree in the northeast, Assiniboin in the north, Yanktonia Sioux and Wahpeton Dakota in the southeast, and Teton Sioux and Crow in the west. The fur trade brought the French, Scots, English, Canadians, and Americans, and, by 1800 the Métis, of mixed white and Indian ancestry, were an established element.

The earliest white settlers included many Norwegians, Canadians, and Germans who had earlier migrated to Russia. By 1890 the foreign-born constituted about 43 percent of the population, a higher percentage than in any other state; and in the census of 1920, when settlement had been completed, only 32 percent of the white population was of native-born American parentage. By 1980, however, large-scale immigration had ceased, and less than 5 percent of the population was foreign-born.

American Indians are the largest minority group in the state. They constitute about 3 percent of the total pop-

ulation. Unemployment and ill health still occur at a somewhat higher rate among North Dakota Indians than in the non-Indian population. Many Indians, however, are successful farmers, ranchers, professionals, athletes, and politicians. A two-year college is maintained by each of four of the state's reservations.

Most North Dakotans have religious affiliations. Almost one-half are Lutherans, more than one-third are Roman Catholics, and most of the remainder are divided among other Christian denominations. Jewish congregations have existed from before statehood.

The economy.   North Dakota's cool, subhumid climate and its location far from the nation's markets have helped to shape its economy. Among the western north central states, North Dakota has one of the lowest farm incomes, the lowest average rainfall and temperature, the shortest growing season, and the least manufacturing.

Agriculture.   The state produces beef cattle, wheat, rye, and oats and ranks first in the nation in the production of barley, sunflower, and flaxseed. It also sends dairy products, sugar beets, potatoes, and other agricultural commodities to outside markets, from which it buys its farm machinery, building materials, trucks, automobiles, and most of its consumer goods. Wheat is the most important source of farm income.

Major crops

Although agricultural production largely pays for the goods North Dakotans buy in outside markets, it employs less than one-fifth of the labour force. Since World War II, rapid improvements in farming efficiency have led to larger farms, fewer in number and supporting directly less of the population. Farmers' capital wealth, in land holdings and machinery, is often great, but annual income on that wealth is not proportionate.

Industry.   The discovery of oil at Tioga in 1951 led to North Dakota's becoming one of the largest producers of crude petroleum in the nation, and production of electrical power grew greatly after the mid-20th century. In that period also the economy was stimulated by construction of the Garrison Dam, air force bases, and highways and by rural electrification. Manufacturing accounts for only about 10 percent of the state's income, and its lignite, the largest supply of solid fuel in the United States, plays a relatively minor role in the state's economy.

Transportation.   Intrastate and interstate traffic moves primarily over east–west and southeast–northwest routes in North Dakota and secondarily over north–south routes. Fargo is the main centre for intrastate traffic; interstate traffic moves between it and other trading centres in North Dakota and Minneapolis–St. Paul, the nearest metropolis, and the Pacific Northwest. North Dakota has a well-developed system of rail lines, and airlines provide scheduled service to a number of cities.

Administration and social conditions.   *Government.*   The constitution of 1889 provides for a government consisting of a governor elected for a four-year term, 13 elected heads of executive departments, a bicameral legislature of 53 senators and 106 representatives, and several levels of state courts. There are almost 150 departments, boards, and agencies, as well as two state-owned industries. North Dakota ranks in the lower half of states in terms of property tax rates and all taxes per capita.

North Dakota's 53 counties, with populations ranging from less than 1,500 to more than 80,000, all elect commissions and certain officers. Most of the counties are further divided into townships totaling more than 1,300, all of which elect administrative officers. Of the more than 360 municipalities (designated by law as cities regardless of size), the vast majority have mayor–council governments. With about 500 school districts and more than 700 special-purpose districts, North Dakota has some 3,000 units of local government, more per capita than any other state.

Local government

The unified court system comprises the five-justice Supreme Court, 26 district courts in seven judicial districts, 26 county court judges, some serving several counties, and about 140 municipal courts. Judges are elected.

Relatively few North Dakotans vote a party ticket. While Republican candidates have predominated in presidential and state-legislature elections, Democratic governors and U.S. congressmen have not been uncommon.

Education. The great majority of North Dakotans finish high school, and most of these go on to postsecondary education within the state. Many rural elementary and high schools, however, have always been too small to provide full programs. In the late 1980s, for example, 12 high schools enrolled 20 or fewer students.

Access to publicly supported higher education has been greatly prized, with the consequence that in spite of its small population the state finances two full-program universities—the University of North Dakota at Grand Forks, founded in 1883, and North Dakota State at Fargo, founded in 1890. Both offer graduate and professional work and enroll between them well over half of the state's postsecondary students. Private institutions (most notably Jamestown College, founded in 1883, and the University of Mary, at Bismarck, founded in 1959) account for a small percentage of higher-education students.

Health and welfare. North Dakotans receive excellent medical care despite the state's low population density. Although some towns of less than 1,000 population have a doctor, medical practice is concentrated in the four larger cities—Fargo, Bismarck, Grand Forks, and Minot—often in group practice in well-equipped clinics. Few people live more than a two-hour drive from one of the centres. The state has more than 50 general hospitals, a rehabilitation centre, several regional mental health centres, and a state hospital for the mentally ill. The state health department and smaller health districts provide public health services. Colleges of medicine and nursing at the University of North Dakota educate practitioners, and this university and others train additional health-field personnel.

Economic assistance and a variety of social services are provided by the state human services department, county social services boards, and private welfare agencies, especially denominational groups. The state department provides aid to the aged, blind, and disabled and to dependent children; it also directs regional human-services centres. The county boards administer general assistance and medical aid for the aged. Federal sources provide more than two-thirds of the funds for welfare recipients. Relatively few able-bodied adults require or request assistance.

Cultural life. The traditional North Dakota spirit of self-reliance and voluntary cooperation is reflected in the cultural life of the state. Without a large metropolitan centre, the cities and towns with universities or colleges provide the main cultural highlight. Symphony orchestras have headquarters in Fargo, Minot, and Grand Forks, though they make appearances throughout the state. The North Dakota Ballet is located in Grand Forks, where in 1971 the University of North Dakota established the state's first College of Fine Arts. Most of the community art associations, public concert associations, and theatre groups are also located in college or university towns. A summer School of Fine Arts is held at the International Peace Garden, a park located on the border between North Dakota and Manitoba near the Turtle Mountain area.

There is some federal-assistance funding for arts projects in the state, but most other funds for the arts, apart from those expended by educational institutions, have had to come from public subscription. In 1971, however, a small state appropriation made to the North Dakota Council on the Arts and Humanities, the agency through which federal funds for the arts are dispensed, was considered the beginning of a long-term state commitment to the arts.

Among the weakest aspects of North Dakota's cultural life is library service. Because the larger part of the population lives in the country or in small villages, about one-fifth of the people have virtually no contact with library facilities. The libraries of towns with populations of 5,000 or more vary widely in their adequacy. Civic leaders have sought to meet the needs of the rural population with county and regional libraries and with bookmobiles.

Acclaimed North Dakotan writers have included Lois Phillips Hudson, Larry Woiwode, and Louise Erdrich. Elizabeth Hampsten, in *Read This Only to Yourself: The Private Writings of Midwestern Women, 1880–1910* (1982) and other works, has provided collections of previously unpublished writings of North Dakota women in the settlement years.

Indigenous folk traditions continue within the state among the Sioux peoples of Fort Totten and Standing Rock Indian Reservation, among the Plains Ojibwa (locally called Chippewa) people of the Turtle Mountain Reservation and area, and among the people of the Three Tribes—the Arikara, the Hidatsa, and the Mandan—of Fort Berthold. Traditional music and dances, together with beadwork and other crafts, attract many art lovers to the state. The durable and attractive pottery of the Three Tribes is particularly sought after.

Scandinavian cultural traditions remain vigorous. Although none of the 50 Norwegian-language newspapers published between 1878 and 1955 survives, Norwegian language and literature are taught at the University of North Dakota and in several elementary schools. The Sons of Norway have some 8,000 members in the state. Norwegian costumes, customs, and cookery are observed on many occasions but especially on Norwegian Constitution Day, May 17. North Dakotans of Icelandic, Czech, and German ancestry also retain some ethnic customs, and in many families the ancestral languages are still spoken.

North Dakota has several state parks, which draw about a million visitors each year, and the Theodore Roosevelt National Park. Of the state's historic sites, several are also in the National Register of Historic Places. The North Dakota Heritage Center in Bismarck is the most comprehensive of the state's museums, but many smaller museums of interest are to be found throughout the state, sometimes in very small centres of population.

The individualistic character of North Dakotans is reflected in their sports and pastimes, which include fishing, hunting, and trapping. Snowmobiling, ice skating, skiing, and ice hockey are popular winter sports.

HISTORY

The United States acquired the lands drained by the Red and Souris river systems (from 1670 parts of Rupert's Land) by the Rush–Bagot Agreement of 1817, and the remainder of what became North Dakota from France by the Louisiana Purchase in 1803. The recorded history of the state falls into three periods: the period of Indian trade, from about 1738 to 1871; of white settlement, from 1871 to 1915; and of adaptation, since 1915.

Explorers and traders. Although European goods were traded among the Indian peoples before his arrival, the first known white visitor to North Dakota was Pierre Gaultier de Varennes, Lord de La Vérendrye, a native of Canada who visited a cluster of earthen-lodge villages near present-day Bismarck in 1738. Traders from Hudson Bay and Montreal began to go to the area on a regular basis in the 1790s. The best-known visitors of the early years were Meriwether Lewis and William Clark, whose expedition made winter camp in 1804–05 near present-day Stanton.

In the 1820s and '30s American traders made the upper Missouri country a hinterland to St. Louis. They brought in guns, kettles, blankets, and axes, as well as liquor and disease. The white man's goods made the Indians dependent on the traders, his liquor demoralized them, and his diseases killed them. In 1837 smallpox, carried up the Missouri by passengers aboard a steamboat, reduced the Mandan population from about 1,800 to 125 in a few months. Indian hostility grew when steamboat traffic increased after the discovery of gold in Montana in 1862 and when the U.S. Army built forts along the rivers. In 1876 Lieutenant Colonel George A. Custer and the 7th Cavalry set out from Fort Abraham Lincoln, south of present-day Mandan, for their fateful encounter with the Sioux and Cheyenne on the Little Bighorn River in Montana.

Pioneering and statehood. The fur trade declined in the 1860s, and white settlement began in earnest in 1871, when railroads reached the Red River from St. Paul and Duluth, Minn. A flood of pioneers acquired land under the Homestead Act and turned to wheat farming. During the period known as the Dakota Boom (from 1878 to 1886), the many giant farms publicized the new country, and North Dakota wheat made Minneapolis, Minn., the milling centre of the nation in the 1880s. The Northern Pacific and Great Northern railroads vied with one another to reach the richest grain centres. Dependence on

Indian arts and other ethnic activity

Early European visitors

wheat unified the farmers and strengthened the populist revolt against eastern monopolistic practices. The Dakota Territory was divided in 1889, and both North and South Dakota were admitted to the Union on Nov. 2, 1889.

The modern state. Revolt against outside exploitation reached a climax soon after the period of pioneer settlement ended in 1915. Controlling the state government after the 1918 election, the Nonpartisan League enacted a socialist program that included a state-owned bank and a flour mill and grain elevator. The league soon lost political control, but the North Dakota Farmers Union (founded in 1927) launched a strong cooperative movement to control the selling of grain and the purchase of farm supplies. Such radical farm movements made many North Dakotans oppose American intervention in both world wars, because they identified participation with war profits for Wall Street.

Since 1915 North Dakota's history has been marked by continuing adaptations to the cool, subhumid grassland environment, the most important of these being the increasing mechanization of agriculture, the enlargement of farms, the loss of rural population, and the widespread use of the automobile. After World War II came rural electrification, soil conservation, and highway construction. In the 1950s North Dakota became an oil-producing state, and in the 1960s air bases, missile sites, and antiballistic-missile installations were built there.

In the decades following, the state's economy and its population levels and distribution reacted sensitively to external forces, especially variations in the pricing of both fossil fuels and agricultural products, in changes in weather, in federal support programs, and in international currencies. In comparison with states having larger populations and broader tax bases, in North Dakota such influences affect disproportionately even the small percentage of wealth derived from manufacture and tourism. North Dakotans generally retain a basic stability, balancing realism with long-range optimism and seeking new forms of economic development while preserving their love of the land and what it can produce.   (E.B.R./B.O'K.)

Ohio

The first state to be carved from the Northwest Territory when it became the 17th member of the Union on March 1, 1803, Ohio, in the 20th century, reflects the urbanized, industrialized, and ethnically mixed United States that developed from an earlier agrarian period. The pattern of its life is so representative of the nation as a whole that it is often used to test attitudes, ideas, and programs in education, politics, and industry. Significantly, Ohio has supplied by birth or residence eight U.S. presidents— William H. Harrison, Ulysses S. Grant, Rutherford B. Hayes, James A. Garfield, Benjamin Harrison, William McKinley, William H. Taft, and Warren G. Harding.

The state's accessibility has been perhaps the key factor in its growth. Its location between the Eastern Seaboard and the growing Midwest and its lack of natural barriers to movement made it a corridor for east–west travel. With Lake Erie on the north, Pennsylvania on the east, West Virginia and Kentucky on the southeast and south, Indiana on the west, and Michigan on the northwest, Ohio lies in the heart of the nation's old industrial belt, close to major resources of raw material and labour and to the markets of the East, Midwest, and South.

Ohio's area of 41,330 square miles (107,044 square kilometres), excluding 3,457 square miles in Lake Erie, ranks only 35th in size among the states; it is one of the smallest states west of the Appalachian Mountains. The state ranks near the top, however, in population. Ohio's capital, after being located in Chillicothe and Zanesville during the early years of statehood, was finally established in newly founded and centrally located Columbus in 1816. The state takes its name from that of the river, an Iroquoian word meaning "great water."

PHYSICAL AND HUMAN GEOGRAPHY

The land. The topography, river systems, groundwater, and soils in most of Ohio are the products of glacial activity. These factors have strongly influenced the patterns of human settlement and land use.

Relief. Ohio straddles two major subregions of the Interior Lowlands physiographic region of the United States: the Appalachian Plateau on the east and the Central Lowlands on the west. These two subregions divide the state almost in half. The Appalachian Plateau reaches westward from Pennsylvania and West Virginia into the counties along Ohio's eastern border, from near Lake Erie to the Ohio River. The northeast is only partially glaciated, while the southeast is unglaciated terrain. Throughout the plateau the land is dissected by rivers winding among steep hills, and many elevations reach 1,300 feet (395 metres).

West of the Appalachian Plateau stretch the Central Lowlands. The eastern lake section, or Lake Plains, stretch along Lake Erie to the northwestern counties and the Michigan border and then extend irregularly to the south. These level to slightly rolling lands were once under water, and the swampiness of the northwest, around Toledo, posed obstacles to settlement before drainage made it more arable. The Central, or Till, Plains, which extend westward toward the Mississippi River, include parts of western and southwestern Ohio and provide a deep soil. This region contains the state's highest and lowest points: Campbell Hill, the highest point, at 1,550 feet (472 metres), is located near Bellefontaine; the lowest, at 433 feet (132 metres), lies at the confluence of the Miami and Ohio rivers, near Cincinnati.

Drainage. The principal water sources are rain-fed streams, lakes, and reservoirs. Floods, once prevalent, are controlled by state and federal dams and other conservation measures. Groundwater is used widely for public supplies, though the industrial and population centres have limited resources. Huge stores of these waters are buried in preglacial valleys in central and south central Ohio.

Lake Erie, with an average depth of only 62 feet (18.9 metres), is the shallowest of the Great Lakes. It is also the most tempestuous, with frontal storms often roaring across it from Canada, and the most liable to shoreline erosion, harbour silting, and filling of its bed. Its shallowness, coupled with the concentration of population and industrial plants in its watersheds, led to severe pollution. Programs in various areas deal with the problems of the lake, which continues to be the principal source of water for many lakeside cities. Attempts to abate pollution in Lake Erie have begun to show signs of success. Fish have returned to previously uninhabitable waters, and a revival of sport fishing and recreational activity has stimulated economic growth along the shoreline.

A low watershed separates the 20 percent of Ohio drained by the Maumee, Cuyahoga, and other rivers emptying into Lake Erie from the 80 percent drained by the Miami, Scioto, Muskingum, and others flowing into the Ohio–Mississippi system. The Ohio, only a tiny part of which is under state jurisdiction, is canalized and channeled for its entire length, as is the Muskingum from Zanesville to Marietta. More than 100 lakes and reservoirs supply recreational and industrial water.

Soils. Most of Ohio's soils are well suited to agriculture. The Till Plains soils are mainly rich glacial limestone, but the Lake Plains are the most productive. The sandstone soils of central and northeastern Ohio are best adapted to pasturelands, while the thin-soiled and heavily eroded hilly areas of the southeast support little productive farming except in river bottomlands.

Climate. Temperatures in Ohio are similar to those across the north central and eastern United States, with summer highs and winter lows seldom reaching 100° F (38° C) and −20° F (−29° C), respectively. The state is open to cold, dry fronts from Canada and to warm, moist fronts from the Gulf of Mexico. The frequent meeting of such fronts causes much of the state's precipitation, which totals some 38 inches (965 millimetres) annually, including an average annual snowfall of 28 inches.

Plant and animal life. The great hardwood forests that covered 95 percent of Ohio prior to European settlement have been reduced to less than 25 percent. The glaciated areas have stands of timber that include oak, ash, maple, walnut, basswood, hickory, and beech. Much cutover land

tative state

Lake
Erie and
the river
systems

Forested
areas

in the southeastern and south central regions has been re-forested. Both wild and domestic flowers abound, though the clover, wild rye, and bluegrass of early Ohio are gone.

Of the 350 bird species found in Ohio, at least 180 are native. Among the 170 fish species are bass, trout, and perch, while the 60 or more species of mammals include deer, opossum, fox, skunk, groundhog, and rabbit.

Settlement patterns. Despite its many large urban areas, more than four-fifths of Ohio is cropland and forest. The urban areas of Ohio first exceeded the rural in population in 1910, and by the late 20th century the urban population made up about 75 percent of the total. Areas outside central cities contain more than half of the population, and Ohio's large cities are following the national pattern of losing population to surrounding suburban areas. The growth of Columbus proper is largely attributable to annexation of township lands.

It is possible to identify several regions throughout Ohio that have distinctive landforms, human and physical resources, and economic characteristics.

The Maumee valley region in the northwest is primarily agricultural. Corn, soybeans, and wheat, as well as hogs and dairy and poultry products, are important. Its largest city, Lima, is an industrial and market centre. The Lake Plains region on the southwestern shores of Lake Erie also has flat, fertile plains with highly productive soils. Toledo, the major city, is an important centre in the Great Lakes industrial belt and a major coal-handling point. It supplies glass and transportation equipment to nearby Detroit and processes the farm products of the region.

The Lakeshore and Uplands region in the north and northeast, with approximately one-fifth of the state's land, contains Ohio's largest industrial concentration and holds more than two-fifths of its population. Cleveland is the industrial, financial, and cultural centre. Akron is a centre of rubber and polymer industries and of trucking. Youngstown is a major metal producer and fabricator, and Canton specializes in the production of such items as roller bearings, bank vaults, and vacuum cleaners.

The Sandusky valley region in north central Ohio is basically agricultural, though the small cities of Marion, Galion, and Bucyrus have some manufacturing. The Scioto valley region of rolling plains in central Ohio has a diversified economic base. Columbus, its central city, is the home of the state government and of numerous educational institutions, including Ohio State University. About half of the working force is employed in government, education, finance, and other service occupations.

The Tuscarawas valley region of eastern Ohio and the Ohio valley region in the south and southeast are predominantly rural. Terrain limits agricultural productivity in both regions. In the southwestern part of the region wheat, corn, tobacco, and hogs are the principal products. Mining and lumbering provide the largest proportion of income in the southeastern part. Stone, clay products, chemicals, and metal fabrication are major industries.

The Miami valley region, in southwestern Ohio, centres on Cincinnati and Dayton. Cincinnati is important in the production of machine tools and other manufactures. Dayton produces business machines, computers, and automotive products. Nearby Fairborn is the home of Wright-Patterson Air Force Base, a major research centre.

The people. The people who laid the foundations of Ohio came from the older seaboard states. The first permanent white settlement in Ohio and the Northwest Territory was at Marietta in 1788 by a company of New Englanders who had fought in the Revolution. In the same year a group from New Jersey established a settlement near Cincinnati, and in the next few years other villages sprang up. In the south, particularly in the Virginia Military District between the Scioto and Little Miami rivers, many of the settlers came from Virginia and Kentucky. In 1796 the Western Reserve in northeastern Ohio was first settled, mainly by New Englanders from Connecticut.

Many Protestant Scotch-Irish settlers came from the Middle Atlantic and Southern states. Prior to 1830, Pennsylvania Germans and Swiss came to the east central area. After 1830 settlers came directly from Germany and Ireland. Many Irish came to work on the Ohio canals

(margin left:) Early European settlers

and stayed on, and when the railroads were built, the Irish and German workers remained as permanent settlers. Germans who drained the Black Swamp country of the northwest stayed on to develop the resultant farmlands.

After 1830 Roman Catholic immigrants from southern Ireland settled in such cities as Cleveland, Columbus, and Cincinnati, where by 1850 they were second in number to the Germans among foreign-born residents. In Lancaster immigrants from Württemberg joined the Pennsylvania Germans who had founded the city.

In northeastern Ohio, Canton and Steubenville were established by Pennsylvania Germans. German settlers also were attracted to the rolling surface and fertile soil of Wayne county, which became one of the top agricultural counties in the nation. German-speaking Moravian missionaries under the leadership of John Heckewelder and David Zeisberger came to the Tuscarawas valley to Christianize the Indians in the early 1770s. In 1817 Joseph Bimeler founded an experimental communist settlement in Zoar that lasted until 1898. The Swiss settled around Dover and Sugar Creek in Tuscarawas county, as well as in Monroe county. In Holmes county, Amish immigrants from Germany and Switzerland established settlements that still remain. There are now more Mennonites in Ohio than in Switzerland, and the state's Old Order Amish community is the largest in the world. Quakers from the Middle Atlantic states and the South settled in eastern and southwestern Ohio early in the 19th century.

The Welsh arrived in the early 19th century to develop the mineral resources in several regions of Ohio. They were especially numerous in Jackson county, and for a long period Welsh was the only language that was spoken there. The Eisteddfod, a festival of Welsh bards, and other elements of Welsh culture and music flourished. The language persisted to the third generation in many communities, with old Welsh songs passed on from one generation to the next.

In 1850 the principal racial stock was Scotch-Irish, although the Germans and the English also were important elements. In 1870 nearly 14 percent of Ohio's population and 40 percent of Cleveland's were foreign-born. The New England character of northern Ohio's beginnings was changing. Each new group established its own newspapers, clubs, social life, and churches.

Increasing numbers of immigrants from eastern and southern Europe came to Ohio after 1880. By 1920 large numbers of Italians, Poles, Hungarians, Russians, and other groups had come to Cleveland, Toledo, Youngstown, and other industrial cities. Southern whites from Appalachia came in large numbers to Akron, Dayton, and Cincinnati. Cleveland, however, became Ohio's most ethnically diverse city. Its foreign-born population was supplemented between 1880 and 1890 by new arrivals from Austria, the Netherlands, Russia, Hungary, Portugal, Greece, China, Japan, Turkey, and Mexico. The city's culture eventually was enriched by some 50 groups with different languages and backgrounds. Many new Roman Catholic and Eastern Orthodox churches, as well as synagogues, were built. The Greeks brought their coffeehouses, and the Slovenes and Poles brought their social halls. The descendants of these ethnic groups have firmly established themselves in the social, economic, and political life of the state.

(margin right:) The diversity of Cleveland's population

The changing character of the state is shown as well in the growth of the black population. In 1850 the black population of Ohio was about 25,000. By 1870 it had risen to more than 63,000. Most blacks lived in southern Ohio, where Wilberforce University, one of the first permanent black educational institutions, was established. By 1980 Ohio's black population of more than 1,000,000, most of it in the cities, constituted 10 percent of the total.

The economy. A good location, a rich store of natural resources, productive soils, cheap energy, and ample transportation facilities have made Ohio one of the great industrial states. More than half of the nation's population is within 500 miles (800 kilometres) of its borders; and coal, oil, natural gas, clay, salt, limestone, sandstone, shales, and gypsum help supply local industries. About two-thirds of the raw materials processed in Ohio's factories come from its own resources. More than one-fourth of the labour

force is employed in manufacturing, although heavy basic industrial production has declined since the 1970s. Ohio's continuing activity in agriculture and mineral production provides economic balance and diversity.

Mining. Ohio's mineral resources are heavily exploited. Coal production accounts for the highest return, followed by industrial minerals, gas, and oil.

Coal was discovered in Ohio as early as 1808. It was adapted for use with iron ore and limestone in the pioneer iron-making enterprises that sprang up in the eastern and south central parts of the state. Later, the discovery of deposits of iron ore in the upper Midwest gave rise to important iron and steel centres in northern Ohio. Usable coal supplies are found throughout eastern and southeastern Ohio. Most coal is produced by strip mining. Enforcement of laws regulating strip mining and requiring restoration has eased environmental problems, but citizen groups still battle for stronger safeguards.

Limestone is used in many construction and manufacturing processes. Ohio is among the top states in sandstone and in sand and gravel production. The abundance and quality of surface clays, plastic fireclays, shales, and some gypsum and peat have made Ohio a leader in the manufacture of ceramic products. The majority of its extensive salt production comes from large rock-salt mines, with the remainder from brine. It is estimated that the state's salt deposits could supply the nation's need for centuries.

Petroleum
and
natural
gas
production

Ohio has been a producer of oil and natural gas since 1860, but by 1900 production in the state had declined. In the early 1960s, however, new oil and gas deposits were discovered, and the industry revived modestly. Ohio must import substantial amounts of oil and natural gas.

Agriculture. In 1850 Ohio ranked first among the states in agricultural production, and it has continued to rank near the top. Although farm acreage and the number of farms and farmers have decreased, nearly two-thirds of Ohio is still farmland. Commercial farming, or agribusiness, largely has supplanted the family farm in producing cash crops, but the Amish, using old-fashioned techniques, and others are still able to make the family farm profitable. Ohio produces corn (maize), wheat, oats, soybeans, and hay, and it maintains large marketing inventories of fruit, feed, and vegetables, as well as livestock and poultry.

Industry. Manufacturing is Ohio's most important economic activity and represents the largest single segment of the state's employment. Transportation equipment, non-electrical machinery, and fabricated metal products are the largest manufacturing enterprises in terms of employment, despite the movement of much heavy manufacturing to other regions of the nation and the world. The steel and clay products industries are also significant.

Transportation. Ohio's chief transportation system in the first years of statehood, as in the territorial period, was its water routes. Lake Erie and the Ohio River provided east–west passage for Indian traders, pioneers, and settlers, and many rivers provided access to the interior. Shortly after statehood the development of transportation facilities began. Between 1825 and 1838 the federal government extended the Cumberland (National) Road across Ohio. In 1811 the first steamboats appeared on the Ohio River, and in the 1820s the era of canal building began and lasted for some 30 years. The first railroad was constructed in 1832, and in the 1850s the first great east–west rail lines were constructed across Ohio.

Ohio's transportation facilities play a major role in moving passengers and goods by highway, railroad, river, lake, and air. The shipping to and from its lake ports is worldwide, and the Ohio River carries more tonnage than the Panama Canal. The railroad mileage is among the nation's largest. The pioneering experiments of Dayton's Wright brothers, Orville and Wilbur, led to the first successful aircraft flight, at Kitty Hawk, N.C., in 1903, and Ohio is now both a testing and a commercial aviation centre.

Administration and social conditions. *Government.* Ohio's present constitution was adopted in 1851. The executive branch is composed of the governor, lieutenant governor, attorney general, secretary of state, auditor, and treasurer, all elected for four-year terms. The General Assembly consists of the Senate, with 33 members elected for four-year terms, and the House of Representatives, whose 99 members serve two-year terms. It has broad powers in policy formulation and monetary appropriation. The judiciary comprises the seven-member Supreme Court, 12 courts of appeals, courts of common pleas and of probate in each of the 88 counties, and such other lower courts as the legislature may establish. All judges are elected for six-year terms.

Each county except Summit, which has a home-rule charter, exists as a quasi-municipal corporation, an arm of the state government but without general authority of self-government in the legislative field. Most larger cities operate under home-rule charters that permit them to choose the form of government most suitable to their needs. The mayor–council type is most common, though Cincinnati and several other cities operate under a city-manager–council plan. The township, Ohio's oldest form of government, remains important, though the number is diminishing as townships are annexed into municipalities or as newly incorporated villages assume their functions.

Local
govern-
ment

State laws carefully prescribe the rules for forming and running political parties, conducting elections, and balloting. The two-party system has prevailed generally, but Ohio has produced such minor-party leaders as Norman Thomas, many times a presidential candidate on the Socialist Party ticket; Victoria Claflin Woodhull, in 1872 the first woman to run for president, with the Equal Rights Party; and Jacob Coxey, who led the march of "Coxey's Army" from Massillon, Ohio, to Washington, D.C., in 1894 to demand various economic reforms.

Since its inception the Republican Party has been slightly more successful than the Democratic in statewide elections. In national politics the parties are evenly matched. Although dynasties are rare in Ohio political life, the Tafts of Cincinnati may constitute one. William Howard Taft served as president and as chief justice of the U.S. Supreme Court. His father had been secretary of war and attorney general under President Ulysses S. Grant and was later U.S. minister to Russia and Austria-Hungary. His son, Robert A. Taft, served in the U.S. Senate from 1939 to 1953, and his grandson, Robert A. Taft, Jr., served in the U.S. Senate from 1971 to 1976.

Education. Authority for Ohio's primary and secondary public schools rests with the state legislature. A State Board of Education, comprising one elected member from each

congressional district of the state, appoints a superintendent of public instruction, who heads the Ohio Department of Education. City, county, local, and exempted school districts exist as subdivisions of the state organization. The direction, administration, and financing—shared by state and local government taxing units—of the public schools is delegated to the individual school districts. Private and parochial schools, though governed by the same laws that apply to public schools, receive no direct state support.

Higher education   Ohio often has been called a "land of schools and colleges," and it ranks among the top 10 states in the number of accredited colleges. Ohio University was established by Ohio's first legislature in 1804 as the first public institution of higher education west of the Alleghenies. In 1809 Miami University became the second. Ohio State University, founded in 1870, is the largest state-assisted university. A land-grant college and a major graduate and professional centre, it also has one of the largest undergraduate enrollments in the nation. Ohio has several comprehensive state universities and numerous branch campuses, technical colleges, and community colleges. Many of Ohio's small independent colleges have made distinguished contributions to the state and have pioneered in education in various ways. Oberlin College, founded in 1833, became the first coeducational college in the United States and one of the first to admit blacks. Antioch College (part of Antioch University), founded in 1852, is one of the nation's oldest experimental liberal arts colleges. Like some other Ohio institutions, it has implemented innovative programs for advancing minority students.

Health and Welfare.   The aged and poor, the blind and disabled, and crippled and dependent children are among the groups that benefit from the welfare activities of several state agencies. Other state bodies oversee programs in the prevention and cure of illnesses. Ohio has six medical schools and an osteopathic college, as well as many strong regional hospitals. The Cleveland Clinic has an international reputation. A youth commission operates diagnostic and training centres, youth corps, and schools. State activities with labour and industry include programs in employment and unemployment services, industrial safety, and worker's compensation.

Cultural life.   Early settlers of Ohio put the stamp of their former homes—New England, the Middle Atlantic states, Kentucky, and Virginia—on the state. Although there has not been a clearly identifiable Ohio school in any of the arts, there has been great activity in all of them. When the log-cabin phase of early Ohio ended, most of the settlers followed the building styles that they had known in their former homes. In the Virginia Military District the red-brick and stone houses were built in the Southern Federal style. In the Western Reserve and the Marietta area the New England influence was manifested in the colonial and modified Georgian styles. Later developments tended to follow the fashions of American architecture in general, most of them revivals of earlier European modes such as Greek, Gothic, and Romanesque.

The state has produced such diverse writers as William Dean Howells, Ambrose Bierce, Paul Laurence Dunbar, Brand Whitlock, Charles F. Browne ("Artemus Ward"), David Ross Locke ("Petroleum V. Nasby"), Sherwood Anderson, Louis Bromfield, and James Thurber, many of whom drew upon their Ohio background.

Music and other performing arts   The Cleveland Orchestra is among the finest in the world, and the symphony orchestra of Cincinnati (once considered the musical centre of the inland United States) is also renowned. The Blossom Music Center, located between Cleveland and Akron, is the site of a summer festival. Programs in music, theatre, dance, and the visual arts abound in Ohio's colleges and universities. With community theatres and arts centres, they serve as the cultural hub for many cities and towns. The Cleveland Play House and the Karamu House, which attempts to bridge black and white cultures, also in Cleveland, have long had a national reputation. The Cincinnati Playhouse in the Park, noted for its experimentation, and the Cincinnati Opera are among major regional companies. The Ohio Arts Council, which was established in 1965 by the state legislature, aids communities and arts organizations.

The Cleveland Museum of Art ranks among the foremost art galleries in the nation, and those in Cincinnati, Toledo, Youngstown, and Columbus also hold major collections. In addition, many historical sites are maintained by state and local societies, including Indian mounds, old forts and battle sites, reconstructions of early settlements, and graves, homesteads, and memorials to Ohio's presidents and other leading citizens.

Ohio has a well-developed system of public libraries in addition to college and university facilities and specialized libraries in many fields. The State Library of Ohio, in Columbus, serves the entire state. Bookmobile service is a feature of rural areas.

The state has a number of laboratories maintained by specialized institutes, industries, educational institutions, and government agencies. Reflecting industrial concentrations, Akron is a world centre for rubber research, and Cleveland is known for research in lighting. Battelle Memorial Institute, in Columbus, is one of the largest private research organizations in the world. A number of federal centres are devoted to aviation medicine, aeronautics and space, atomic energy, agriculture, and forestry.

Reflecting Old Welsh origins are the Welsh Eisteddfod festivities in Cleveland, Steubenville, Lima, Columbus, and Jackson, and a German Saengerfest (Song Festival). More than 40 other nationality groups present folk music and dances at festivals throughout the state. Ohio boasts one of the nation's largest state fairs, and each county has an annual fair. Other gatherings include the Apple Festival in Jackson, the River Days Festival in Portsmouth, the Ohio Hills Folk Festival in Quaker City, and the Pumpkin Show in Circleville.

Recreational facilities include extensive state park facilities in addition to numerous municipal recreational areas. The Cuyahoga Valley National Recreation Area lies between Cleveland and Akron. Public gardens, zoos, caves and caverns, and privately run amusement parks add to Ohio's recreational repertory.

HISTORY

Prehistory and settlement.   Remains of ancient peoples dating to 9000 BC have been found in Ohio. The later Adena and Hopewell cultures built elaborate burial and ceremonial mounds and fashioned exquisite artifacts. Both cultures had disappeared from the area by about AD 300–400. Present-day Ohio was largely unoccupied when Europeans first saw it in the 17th century. Villages of historic Indians—the Miami, Wyandot, Shawnee, Delaware, Mingo (Iroquois), and Ottawa—appeared in the 18th century.   **Indian cultures**

The long Anglo-French struggle to control the transAppalachian west culminated in British victory in 1763. The United States then won this region during the American Revolution. Following the Treaty of Paris (1783), Congress created the Northwest Territory north of the Ohio River and enacted the Ordinance of 1785, which established an orderly settlement pattern, and subsequently the Northwest Ordinance of 1787, which called for the creation of new states therein.

Statehood.   Ohio achieved statehood in 1803, the first state to be formed entirely from the public domain. From the outset it was socially diversified. It was a theatre of war in 1812–13; Oliver Hazard Perry's victory over a British fleet on Lake Erie helped clear the area of its last threat from Indians and their British suppliers. Population swelled, aided by a newly developed network of canals, roads, and railroads. By 1850 Ohio was the third most populous state in the nation, with nearly 2,000,000 residents, and the leader in diversified agriculture.

Economic growth.   Ohio's industrial structure was built between 1850 and 1880, when the value of its manufacturing grew to more than twice that of agriculture. A major stimulus was provided by the American Civil War (1861–65), in which Ohio supported the North, though there was strong antiwar sentiment in the state. After the war the growth continued, notably in the northeast and around Lake Erie. This growth led to considerable economic and social dislocation. After 1900 much attention was given to municipal reforms in Cleveland, Toledo, and other   **Development as an industrial state**

cities and to statewide programs that attempted to alleviate problems caused by industrialization. In 1920 two Ohioans, Warren G. Harding and James M. Cox, faced one another for the presidency, and Ohio has continued to play a pivotal role in national political life.

Ohio reflected the racial strife that was widespread in the United States in the 1960s, when disorders in the predominantly black Hough and Glenville districts of Cleveland took a number of lives. In 1968 Carl B. Stokes became Cleveland's mayor—the first black mayor of a large U.S. city. In May 1970 four students were killed by national guardsmen, who had been called out as a result of demonstrations at Kent State University, near Akron.

In the late 1970s Cleveland experienced severe economic problems that included the city's default on its debts. Although these difficulties were resolved, changing national and global economic conditions continued to hamper Cleveland and the state. Since the 1970s, therefore, Ohio has shifted away from manufacturing and more toward a service-oriented economy.   (F.R.A./G.W.Kn.)

South Dakota

South Dakota is a Great Plains state bordered on the north by North Dakota, on the east by Minnesota and Iowa, on the south by Nebraska, and on the west by Wyoming and Montana. Its boundaries contain 77,116 square miles (199,730 square kilometres), which are split by the upper Missouri River valley into "east-river" and "west-river" regions. The state is named for the Dakota division of the Sioux Indians. Pierre, near the centre of South Dakota, is one of the smallest state capital cities; it is named for the 19th-century St. Louis, Mo., magnate Pierre Chouteau, Jr. South Dakota was admitted to the Union as the 40th state on Nov. 2, 1889.

Ethnic diversity

South Dakota remains a predominantly rural state. Slightly less than one-tenth of the population is American Indian, representing 13 tribes of the Sioux. The non-Indian populace contains more than 20 ethnic and religious groups that retain some Old Country ways—Norwegians, Swedes, Danes, Dutch, Irish, German-Russians, Mennonites, Hutterites, "Plain Germans," several subdivisions of Czechs, English, Welsh, and others. In a society of such diverse heritage there is no typical South Dakotan.

PHYSICAL AND HUMAN GEOGRAPHY

The land. *Relief.* Eastern South Dakota lies within the glaciated physiographic province known as the Prairie Plains. West-river, except for the Black Hills in the southwestern corner, has the rolling topography of the unglaciated Great Plains, characterized by high buttes, rough canyons, and wide expanses of nearly level tablelands. It includes the Badlands, which extend along the White and Cheyenne rivers for more than 100 miles (160 kilometres). The eroded landscape of the Badlands has been a rich repository of fossilized prehistoric animals and the primary source of the siltation that has given the Missouri its nickname, Big Muddy.

The Black Hills

The Black Hills—two-thirds of which lie in South Dakota, with the remainder in Wyoming—constitute a dome-shaped uplift rising 3,500 feet (1,100 metres) above the surrounding terrain. Harney Peak, near the centre of the formation, at 7,242 feet (2,207 metres) above sea level, is the highest point in North America east of the Rocky Mountains.

Drainage. The Missouri River drains all of the state except the northeastern counties, from which runoff flows through Big Stone Lake and Lake Traverse, near the Hudson Bay–Gulf of Mexico divide, into the Minnesota River and the Red River of the North. In eastern South Dakota the principal tributaries of the Missouri are the Big Sioux, Vermillion, and James rivers, which flow southward. In the west-river region the Grand, Moreau, Cheyenne, Bad, and White flow eastward to drain the Black Hills and the Great Plains.

Soils. The chernozem, or black, soils, formed mostly from glacial drift and well adapted for wheat and corn (maize), cover the east-river area. Within the Great Plains province are the chestnut and Pierre, or gumbo, soils,
Sylvan Lake and (centre) Harney Peak in Custer State Park, in the Black Hills region of South Dakota.
Craig Blacklock—Blacklock Nature Photography

distinguished by their heavy, sticky texture. They are well suited for grassland industries.

Climate. The climate is characterized by extremes in temperature, low precipitation, and relatively low humidity. The skies are generally clear. Cyclonic storms occur frequently in the east-river section during the spring and summer. A weather station at east central Huron reports average lows of 2° F (−17° C) and highs of 23° F (−5° C) in January, as well as average lows of 61° F (16° C) and highs of 87° F (31° C) in July. Extreme temperatures recorded are −39° F (−39° C) and 112° F (44° C). The average number of frost-free days ranges from 160 in the southeast to 110 in the Black Hills.

The average annual precipitation for the state is 19 inches (480 millimetres), but it ranges from about 24 inches along the eastern border to 14 inches or less in the northwestern corner. In the centre of the state, the transitional zone between the Prairie Plains and the Great Plains, precipitation drops from 20 inches to 18 inches. About three-fourths of the rain falls during the growing season, and snowfall ranges from about 22 to 60 inches. The Black Hills region receives more moisture, especially in winter, than the surrounding plains.

Plant and animal life. At the time of settlement by non-Indians the east-river region was a prairie covered by a thick matte of tall grasses growing to a height of three feet or more. These tall grasses have a deep root system adapted to subhumid conditions. The shortgrass species, chiefly the grama, buffalo, and western wheat grasses, are endemic to the Great Plains. Drought-resistant with a shallow root system, they mature quickly.

Virgin prairie grasslands

The wooded areas lie mainly in the Black Hills and along the buttes that rise in the northwestern part of the state. Most wooded acreage is incorporated into the Black Hills National Forest and the Custer National Forest. The western yellow, or ponderosa, pine is the chief commercial tree.

Custer State Park in the Black Hills has a large herd of bison. Other Black Hills species include antelope, deer, elk, beaver, bobcat, and porcupine. Coyotes, jackrabbits, and prairie dogs are plentiful elsewhere. The state has nearly 300 species of birds. Bald and golden eagles are found along the Missouri valley and in the Badlands. The Missouri is an important flyway for the north–south migration of waterfowl, mostly ducks and geese. South Dakota has long been a hunter's paradise because of its plentiful

supply of ring-necked pheasants, a game bird introduced into the state from Asia early in the 20th century.

Settlement patterns. During the second quarter of the 18th century, most of the Sioux, in a federation of 13 tribes, abandoned east central Minnesota and spread westward to settle their former hunting areas on the prairie and the Great Plains. The Yankton division claimed most of east-river, while the Teton tribes, together with Yanktonai, occupied west-river. Present-day South Dakota lies near the centre of some 80,000,000 acres (32,380,000 hectares) that once comprised Sioux country.

Between the American Revolution and the middle of the 19th century, some non-Indians settled along the Missouri valley. More immigrants, of northern and western European heritage, spread out across the east-river farmland from the mid-1850s to the late 1880s. Others, mainly of eastern European origin, joined migrants from settled U.S. communities to the east and took over the best arable and grazing areas west of the Missouri River by 1920.

Except for the Black Hills region, the west-river area has only about two persons per square mile, in contrast with the northeastern and southeastern regions, where the density is generally four times greater. Only about one-fifth of the rural residents in the state live west of the Missouri River.

The east-river section comprises two demographic areas, approximately north and south of a line running eastward from Pierre. Cash-crop farming prevails to the north, with reliance on wheat and other small-grain crops. To the south a more diversified farming economy exists, with feed grains and livestock production as its specialties.

The people. *Ethnic distribution.* The Indians of South Dakota maintain a way of life established by forebears as their reservations were founded to make room for white settlement during the 19th century. Some three-fourths of the Indians claim reservation residence. Most urban Indians in the state either live on the reservations part-time or make frequent visits to them to maintain cultural ties, while they take advantage of the job and educational opportunities offered in urban areas.

The earliest white settlers who followed British and French fur traders into what is now South Dakota came mainly from the upper Mississippi valley, many with a New England background. Immigrants arriving directly from northern and central Europe also played an important part in the colonizing process. In 1890 one-third of the white residents were foreign-born. Although today only a small percentage of the residents are foreign-born, nearly half the population are only two or three generations removed from Europe. The Americanization of the general population, white and Indian alike, is apparent. Yet ethnicity is featured in rural enclaves through the preservation of languages, religious affiliations, food preparations, festive celebrations, and ethnic educational efforts.

Those of Scandinavian descent make up about a third of the foreign stock. The Norwegians are located mostly in the east-river region, and Swedish and Danish communities are found in the southeastern part of the state. Persons of German descent make up about a sixth of the population, with a substantial number reportedly using German as a first or second language. They include German-Russians, who are heavily concentrated near Yankton in the southeast and in three north central counties. The Czechs, largely Bohemians, generally live in the south central counties. The Dutch, the Finns, and the Welsh are scattered across the eastern part of the state.

Religions. Immigrant groups established about half of the state's churches. Their religious institutions not only promoted social solidarity but also played an important part in the acculturation process. In 1890, Roman Catholics were the most numerous, with Lutherans a close second; today, however, Lutherans outnumber Roman Catholics. Other leading churches are the Methodist, United Church of Christ, Presbyterian, Episcopal, and Baptist.

German groups include Mennonites and Hutterian Brethren. The Hutterites live in isolated colonies, most of them in the James River basin, where they practice communal agriculture. For their refusal to support American involvement in World War I, the Hutterites were driven into temporary exile in Canada. In 1955 they were subjected to a state law prohibiting the expansion of their colonies or the formation of additional communities. They have circumvented this law by changing their legal status from that of church to corporation, but they remain under social pressure as anomalies in the general population.

Roman Catholics have stood out, too, as an important and somewhat persecuted minority. To preserve their faith and avoid harassment, those of Irish, German, and Czech descent formed rural enclaves and supported ecclesiastical schools and hospitals, some of which have survived as institutions vital to the entire population. During the 1920s Catholics were the primary victims of attack by Ku Klux Klan groups in the state. Shunned by the Protestant majority in organized sports, Catholics formed a separate high-school athletic conference early in the 1920s that was not allowed to merge with the public system until forced by the legislature to do so in 1966.

The most maligned of all groups for religious behaviour have been the Indians. Only their sun dance was ever declared illegal by federal officials, but Indian worship involving the sacred pipe and peyote had been driven underground through social pressure and economic discrimination by the 1920s. Tribal members fashioned a "Reservation Christianity," blending Indian traditions with the teachings of Roman Catholic, Presbyterian, Congregational, and Episcopal missionaries. The cross, the pipe, and peyote are focal points of a spiritual environment that is distinctively Indian and remote from the majority of white South Dakotans. In this isolated ecumenical environment, the sun dance has resurfaced.

The economy. Since the fur trade era, the economy of South Dakota has relied mainly on livestock production, farming, tourism, and forest and mineral industries. In addition, the state has benefited from federal installations—notably from operations of U.S. Indian agencies, facilities built by the U.S. Army Corps of Engineers along the Missouri basin, national parks and monuments, and Ellsworth Air Force Base, a part of the Strategic Air Command.

Agriculture. Cash income from livestock and livestock products is generally several times that from crops. South Dakotans are among the leading cattle producers in the United States, and they also rank among the top wool producers in the nation. The state ranks high in the production of rye and flaxseed as well as spring wheat. It is usually among the top 10 states in corn and alfalfa-seed production. Normally, some 300,000 acres are under irrigation, mostly in the west-river region.

Industry. Tourism is second to livestock production and farming in the state's economy. Major industrial goods are food products, light machinery, and lumber and wood materials. Meat processing is important, and there are increasing numbers of "clean" industries, such as a major bank credit-card centre in Sioux Falls.

Principal mining products are gold, cement, stone, and sand and gravel. Gold is extracted from the Homestake Mine at Deadwood-Lead, and cement is produced by the state government in Rapid City. Large lignite beds containing low-grade uranium deposits await development.

The multipurpose Oahe, Big Bend, Fort Randall, and Gavins Point dams on the Missouri River have made South Dakota a major producer of hydroelectric power, most of which is transmitted to consumers outside the state. South Dakotans rely heavily on coal- or oil-fired electrical plants, which are considerably more expensive to operate than hydroelectric plants. Nevertheless, nearly all South Dakota farms are electrified through rural cooperatives.

Transportation. The transformation of 19th-century surface trails into modern roads began early in the 20th century. In the 1920s concrete highways were built, and all routes to centres of population in excess of 750 were graveled. During the 1930s hinterland roads were improved through the use of work-relief and conservation funds. Federal allocations initiated in 1956 led to the completion of two interstate highways (north–south and east–west) across the state. Reliable crossings over the Missouri River were restricted mainly to ferries and periods of ice cover until the 1920s, when modern bridge construction began. The number of crossings also increased with the construc-

Immigrant pioneers

Mennonite and Hutterite sects

Hydroelectric power production

tion of dams on the Missouri River in 1954–66. Since then, the Missouri has not been navigable for commercial purposes upstream from Sioux City, Iowa. The last ferry in South Dakota, at Running Water near Yankton, closed in the mid-1980s.

Passenger rail traffic has disappeared, but freight train transportation revived in the 1980s through the use of state funds for track improvement. South Dakotans have had air service since World War II, when federal funds were used to build airports. Airlines offer regular service to the largest cities, while private planes operate out of more than 150 public and private airstrips.

Administration and social conditions. *Government.* The state constitution was adopted in 1889 and has been amended many times. The governor, lieutenant governor, and most other high-ranking administrative officials are chosen by the electorate, for four-year terms. The legislature comprises the Senate of 35 members and the House of Representatives of 70 members. In 1951 the Legislative Research Council was created to provide continuity between the annual sessions. The congressional delegation includes one U.S. representative and two U.S. senators.

The judicial system comprises the Supreme Court, consisting of five judges, and the Circuit Court, consisting of 36 judges operating within eight judicial circuits. Supreme Court judges are appointed by the governor; Circuit Court justices are chosen by nonpartisan ballot. In January 1975 the Supreme Court consolidated the system of county and local judicial officers into a unified system of magistrates. Law-trained magistrates are appointed by Circuit and approved by Supreme Court judges; lay magistrates are installed by presiding judges in their respective districts. The machinery for law enforcement includes the state's attorney and sheriff at the county level and the office of attorney general at the state capitol. Special enforcement agencies include a state highway patrol, a force of game wardens, and the tribal police cross-deputized with county sheriffs' departments.

South Dakota has more than 3,500 units of government below the state level. These units include 66 counties, more than 300 incorporated towns and cities, and more than 1,000 organized township governments. There are also more than 100 special districts, most of them concerned with soil conservation, drainage, and irrigation.

The state constitution forbids deficit spending. The major sources of income for the state government are a sales tax, revenue from licenses and other fees, and federal aid. Most of the state's expenditures support highways, education, and welfare.

A primary election is held in June during even-numbered years, followed by general elections in November. Special elections often decide local issues. The Republican has been the dominant party since territorial times.

Each of the nine Sioux reservation groups lives under an elected tribal government, six of which are authorized by the Indian Reorganization Act of 1934. The Yankton Sioux tribe sustains a constitution adopted in 1932.

Education. The public school system is administered by local and county boards subject to policies formulated by the Department of Education. Since 1943, legislative appropriations that support public schools have supplemented the general property tax and revenues from the common school lands. School district reorganization was voluntary until 1968, when all districts were compelled to offer a 12-year curriculum. Since then, the number of country schools has diminished considerably, while the number of consolidated high school districts has grown.

Among the state-supported institutions of higher learning are the University of South Dakota in Vermillion (opened in 1882); South Dakota State University in Brookings (1884); South Dakota School of Mines and Technology in Rapid City (1885); and regional colleges at Spearfish, Aberdeen, and Madison. A system of private liberal-arts colleges has been reduced by funding shortages. Private institutions are Augustana College and Sioux Falls College in Sioux Falls, Dakota Wesleyan University in Mitchell, Mount Marty College at Yankton, and Presentation Junior College at Aberdeen. In addition, there are several vocational schools and Indian community colleges.

Health and welfare services. The Department of Health is responsible for programs dealing with communicable diseases and sanitation, as well as with the inspection and licensing of hospitals and nursing homes and the collection of vital statistics. South Dakota's health care training and facilities are unusually strong for a rural state because of a tradition in hospital service and nurses' training by the Benedictine and Presentation orders of the Roman Catholic church. In addition, Sioux Valley Hospital in Sioux Falls has evolved into a sophisticated medical complex, while the University of South Dakota Medical School, originally founded as a two-year institution, has been elevated to four-year, degree-granting status. The addition of federal facilities on Indian reservations since 1917 has kept tribal members apace with rural health care standards. Small county, municipal, and private hospitals increasingly have closed as health care has become concentrated in larger, centrally located facilities.

The welfare needs of the state are the responsibility of the Department of Social Services. More than two-thirds of funds for public assistance are received from federal grants. Institutions maintained by the state include a school for the deaf at Sioux Falls, a centre for the mentally handicapped at Redfield, and a mental hospital at Yankton.

Cultural life. The early settlers attended musical and dramatic performances by traveling artists in local opera houses and heard national lectures sponsored by lyceum bureaus. Schoolhouses were centres of community social life, and local reading circles and library associations developed into modern libraries. Libraries are maintained by numerous state and private institutions, including the library of the South Dakota State Historical Society in Pierre. A traveling library system, operated under the Free Library Commission, was established in 1913.

Many native writers have dealt with the South Dakota scene, including Hamlin Garland and Norwegian-born Ole Edvart Rölvaag, who spent his early immigrant life near Sioux Falls, the locale portrayed in his *Giants in the Earth* (1927). Charles Eastman and Elaine Goodale Eastman preserved 19th-century Indian ways in several volumes. The *South Dakota Review,* a literary quarterly published by the University of South Dakota since 1963, affords an outlet for regional as well as local talent.

In the graphic arts two native-born artists, Harvey Dunn and Oscar Howe, gained wide recognition. Harvey Dunn, reared on a pioneer Dakota homestead and one of the nation's leading illustrators, became well known for his paintings of pioneer life. Oscar Howe, a Yanktonai Sioux, has made use of the motifs and symbolism of his Indian heritage. Gutzon Borglum's stone carvings of four U.S. presidents on Mount Rushmore in the Black Hills are a major tourist attraction. Traditional Indian crafts such as beadwork have undergone a revival.

Among the numerous museums in South Dakota, several stand out for their extraordinary collections and exhibits. The State Historical Society controls the Robinson Museum (Pierre), W.H. Over Museum (Vermillion), Agricultural Heritage Museum (Brookings), and Smith-Zimmerman State Museum (Madison). The University of South Dakota supports the Shrine to Music Museum at Vermillion, and South Dakota State University has the South Dakota Memorial Art Center in Brookings. The large South Dakota State Archaeological Research Center is located in Rapid City, and the Prehistoric Indian Village with its Boehnen Memorial Museum, is under management by the city of Mitchell.

The dramatic arts manifest their appeal at community and summer theatres and the departments of dramatic art on college and university campuses. Notable among the summer theatres is the Black Hills Playhouse, which has operated in Custer State Park since 1946. More spectacular is the Black Hills Passion Play, which has been presented during the summer at Spearfish since 1939. The musical arts are represented by a number of symphony orchestras. Ethnic festivals include Nordland Fest, Czech Days, and numerous Indian powwows.

Among recreational areas are Custer and Bear Butte state parks, Black Hills National Forest, and Wind Cave National Park.

HISTORY

French
exploration

Settlement and gold rush. A lead plate, discovered at Fort Pierre in 1913, records the presence of French explorers during 1742–43. Twenty years later Spain acquired sovereignty over the region, and in 1800 it reverted to France. The territory's inclusion in the Louisiana Purchase led to U.S. ownership in 1803. Trappers and fur traders were the principal European residents of the area until the mid-1850s, when land speculators appeared and the U.S. Army built Fort Randall on the Missouri River. Permanent settlements at Vermillion and Yankton sprang up in 1859. The Dakota Territory was created in 1861, but for several years settlement was confined to the southeast between the Big Sioux and Missouri rivers.

Wars between the Indians and white immigrants went on intermittently from the Grattan Affair in Nebraska in 1854 to the massacre at Wounded Knee, near Pine Ridge, in 1890. Fairly peaceful relations during the fur trade era thus had changed to cultural separation, out of fear if not hatred, from which Indian and white South Dakotans have never fully recovered.

The search for gold in the Black Hills in the early 1870s attracted non-Indians to the western part of Dakota Territory, despite the recognition of Indian ownership by federal treaties. In 1877 the Indians were forced by Congress to accept a reduction of their reservation and to cede the Black Hills. Rapid City emerged as the main gateway city to the region. Freight and stage lines connected the mining population with the East until railroads entered west-river provinces early in the 20th century.

Statehood and homesteading. The gold rush was followed by a flood of settlers into the east-river region, swelling its population from about 80,000 to 325,000 between 1878 and 1887. This rapid expansion led to calls for division of the territory at the 46th parallel and separate statehood for the southern half. In the north and in Congress a single state was favoured. The southern section held constitutional conventions in 1883 and 1885; at the latter the state of Dakota was established. Dual statehood based on a division below the 46th parallel received congressional approval in 1889, and both North and South Dakota were admitted to the Union simultaneously.

The Great Sioux Agreement of 1889 established six reservations for Teton and Yanktonai Sioux and opened more than 9,000,000 acres to white entry. The general complexion of life in South Dakota has not changed appreciably since 1920, when the majority of residents were positioned in enclaves on farms, ranches, small urban centres, and Indian reservations. Adverse climatic and economic conditions have caused some rural-to-urban migration among non-Indians, while limited reservation resources have forced some Indians to leave the reservations. Education, health care, social services, transportation, and tourist industries all have improved. Yet population size has remained fairly static and ethnic diversity has survived.

Conservatism and progressivism. South Dakota's political history is similar to that of its neighbouring states. During the 1890s the appeal of the Populist movement led it temporarily and briefly away from the Republican Party. A four-year fusion administration, however, produced only the nation's first initiative and referendum law.

Political
traditions

At the turn of the 20th century the state was influenced by the wave of progressivism. An insurgent, progressive wing dominated the Republican Party in 1906 and enacted legislation that called for direct primary elections and railroad regulation. From 1917 to 1919 the state adopted a still more radical program, which established a rural credits plan, a system of state hail insurance, a state coal mine, and a cement plant. Of these state-operated enterprises, only the cement plant at Rapid City remains in operation. Since the 1920s the voters have shown a more conservative bent. A major exception to this conservatism has been the state's support of liberal to moderate candidates for Congress, who have been successful in competing for federal benefits. A noteworthy example was liberal Democrat George McGovern, who was the only Democrat elected to Congress from South Dakota between 1936 and 1970. McGovern, however, failed to carry South Dakota in his bid for the presidency in 1972.

The occupation of the village of Wounded Knee by members of the American Indian Movement in 1973 was an expression of the desire for attention to the needs of Indian peoples. It also proclaimed the survival of tribalism, with emphasis on Indian self-determination. The subsequent siege by federal marshals lasted for more than two months, until the Indians were promised that their grievances would be negotiated.

In general, white South Dakotans have been scarcely less dependent on federal support than have the Indians, whose lives have been governed by national policies for reservation Indians. Adversities of climate and economy have shaped a way of life in South Dakota that shows few signs of losing its diverse character.   (H.S.Sc./H.T.H.)

Wisconsin

One of the north central states of the United States, Wisconsin became the 30th member of the Union on May 29, 1848. It is situated between Lake Michigan to the east and the upper Mississippi River on the west. On the north it touches the western portion of Lake Superior and the Upper Peninsula of Michigan. Minnesota and Iowa lie to the west and southwest, respectively, and on the south is Illinois.

The economy of Wisconsin is diversified, with individual elements spread generally throughout the state, though its three major facets have specific regions of concentration. Its southeastern industrial belt, extending across the state line along Lake Michigan from the Chicago area to and beyond Milwaukee, the state's largest city, is the primary factor in making Wisconsin one of the largest manufacturing states in the nation. In the southern two-thirds of the state, a combination of favourable physical factors of climate, soil, and topography makes possible a dairy agriculture that allows Wisconsin to be first in the nation in the production of milk, cheese, and butter. The sparsely settled, northern evergreen–hardwood forest and lake country hosts tourist and recreational activity.

The area of Wisconsin is 56,153 square miles (145,436 square kilometres). The name Wisconsin is an anglicized version of a French rendering of an Indian name said to mean "the place where we live." Madison, the territorial capital from 1836, became the state capitol and home of the University of Wisconsin in 1848.

PHYSICAL AND HUMAN GEOGRAPHY

The five
physical
regions

The land. *Relief and drainage.* Wisconsin comprises five physical regions. The Northern Highland is a broad upland underlain by granitic bedrock. It contains the state's highest point, Timms Hill (1,951 feet [595 metres]) in Price county. The Lake Superior Lowland is a narrow plain to which the surface of the Northern Highland drops abruptly. The upland slopes gently southward to the Central Plain, a crescent-shaped region on a sandstone bed stretching across the centre of the state. In the southwest rises the Western Upland, a region etched into ridges and valleys by streams that have cut into the limestones and sandstones. The Southeastern Ridges and Lowlands are formed by three broad, parallel limestone ridges running north–south and separated by wide and shallow lowlands. The lowest elevation in the state is along the shoreline of Lake Michigan, approximately 581 feet above sea level. Except in the southwest, there are thick glacial deposits throughout the state. The surface of the glaciated areas commonly consists of broad expanses of undulating terrain, with interspersed marshy wetlands or with lakes occurring in clusters or singly; in places the glaciated areas consist of rough, boulder-strewn moraines.

Wisconsin is one of the few states in which essentially all drainage is outflowing. The principal river, the scenic, island-studded Wisconsin, 430 miles long, originates on the Michigan boundary and flows southward to near Madison, where it skirts the Baraboo Range before turning west to cross the Western Upland and enter the Mississippi near Prairie du Chien. A system of reservoirs regulates its flow. Wild rivers include the upper St. Croix, the Namekagon, the upper Wolf, the Pine-Popple, the Brule, and the Pike. The lower St. Croix is designated a scenic river. All of

these are in northern Wisconsin. This region, with a section of neighbouring Minnesota, has one of the largest concentrations of lakes in the world. Wisconsin has nearly 15,000 inland lakes of more than 20 acres (eight hectares), for a total of more than 1,500 square miles. The largest is Lake Winnebago (215 square miles) in the Fox River valley. Included in Wisconsin's boundary waters and under its jurisdiction are 7,387 square miles of Lake Michigan and 2,675 square miles of Lake Superior. Wisconsin has approximately 400 miles of shoreline along Lake Michigan and 150 miles along Lake Superior.

Unusual surface features include the Apostle Islands in Lake Superior; the rocky Door Peninsula between Lake Michigan and Green Bay; the broad gorges of the Mississippi and lower Wisconsin rivers, cut 300 to 500 feet below the general surface; ancient mountain remnants such as the Baraboo Range, Rib Mountain, and the Gogebic Range; the irregular glacial "kettle moraine" west of Milwaukee; the narrow river gorge known as the Wisconsin Dells; and the sandy beaches of Lakes Michigan and Superior.

Major soil types

Soils.   The best Wisconsin soils for agricultural use are the black prairie soils and gray-brown forest soils of the Eastern Ridges and Lowlands Region and the Western Upland; these coincide rather well with the areas having the warmer and longer growing seasons. Soils less favourable for agricultural use are found in the predominantly forested regions of the Northern Highland and the Central Plain. But through the use of irrigation, drainage, and fertilization, even some of these soils have been made highly productive for special crops of vegetables and cranberries. On the steep slopes of the Western Upland strict soil erosion measures must be practiced, and in the Central Plain the sandy soil must be protected from wind erosion. In some places fences such as those used to control drifting snow are also used to control drifting sand.

Climate.   Wisconsin has long, cold winters and warm but relatively short summers. Average temperatures in January range from 10° F (−12° C) in the north to 22° F (−6° C) in the southeast; in July, from 66° F (19° C) in the north to 72° F (22° C) in the southwest. The Great Lakes ameliorate both summer and winter temperatures along their margins. The length of the growing season diminishes westward and northward, from about six months in the southeast—where the best soils are found—to about three months in parts of the Northern Highland.

Annual rainfall averages about 30 inches (760 millimetres), the bulk of it occurring between May and October. Snowfall varies from about 30 inches in the south, with an 85-day cover, to approximately 50 or 60 inches in the north, with a 140-day cover near Lake Superior. Streams and lakes in the state may be frozen from December to mid-April.

Plant and animal life.   Forests once covered about 85 percent of the state, with the remainder in prairies and wetlands. Most of the forests were cleared for lumber and agriculture, but by natural regrowth and reforestation nearly 45 percent of Wisconsin is again forested, most heavily in the Northern Highland and Central Plain. Trees are second-growth hardwoods—*e.g.,* maple, birch, oak, aspen, elm, basswood, and ash—and evergreens—white, red, and jack pine, hemlock, balsam fir, black spruce, white cedar, and tamarack.

White-tailed deer, foxes, cottontail rabbits, skunks, woodchucks, squirrels, chipmunks, and gophers are common in all areas. Black bears, coyotes, wolves, porcupines, beavers, otter, snowshoe hare, and eagles live primarily in the north. Pheasants are stocked in southern farming areas. Waterfowl are abundant, and migratory Canada geese by the thousands visit refuges twice annually. The numerous fish types include panfish, as well as various trout species, bass, walleye, northern pike, muskellunge, and sturgeon.

Settlement patterns.   The majority of the people live in clusters of cities in the southeast, the area first reached and settled by migrants from the East. There they found soils and climate favourable for agriculture. Those who moved farther on across the state, seeking farmland, in time spread themselves fairly evenly except in the southern part of the Central Plain and the Northern Highland,

where infertile or wet soils and short growing seasons discouraged settlement.

Rural agricultural settlement consists of dispersed farmsteads. When viewed from the air, field shapes and road patterns give a checkerboard appearance to the land and reflect the township and range survey system from which they are derived, except where rough surfaces, wetlands, or contour farming patterns break the regularity. In many areas the traditional red dairy barn (considerably larger than the farmhouse), along with its milk house and cylindrical silos, still dominates the farmstead. The rectangularity of the open countryside moves into the small towns in which rectangular lots, each with its dwelling, line the crisscross streets oriented in cardinal directions.

Towns of less than 1,000 people dot the entire state, but most of the larger cities are in the southeast. Milwaukee, with its satellite cities, is one of the country's major manufacturing centres, specializing in machinery and electrical equipment, and is a port. Madison, scenically located between Lakes Mendota and Monona, is the location of the main campus of the University of Wisconsin. Racine and Kenosha, on Lake Michigan south of Milwaukee, are small ports and between them produce tractors and metal goods. Green Bay is a lake port at the mouth of the Fox River and a paper centre. As the home of the Green Bay Packers, it is the sole survivor among major-league franchises of the small Midwestern cities that gave birth to professional football. Appleton is the largest city of a major paper-manufacturing complex located where the Fox River leaves Lake Winnebago. Oshkosh, on the western shore of Lake Winnebago, is a woodworking centre. La Crosse, a Mississippi River port, manufactures varied products.

Principal cities

The people.   Wisconsin's population is predominantly of northern European origin. German immigrants were most numerous, followed by Poles, Scandinavians (primarily Norwegians), and British. Persons of German ancestry are widely distributed today but more concentrated toward the east and in Milwaukee. Poles are numerous but live mainly in Milwaukee and the Stevens Point area. Norwegians are more numerous toward the west and south, with Swedes more toward the north and northwest. Few persons are now of foreign birth, and the majority have become a blend of different national ancestries. Blacks and Hispanics live primarily in the southeastern lakeshore cities. More than four-fifths of Wisconsin's blacks live in Milwaukee, where they constitute nearly one-third of the population. The American Indian population is concentrated largely in the city of Milwaukee and in Menominee county.

Wisconsin's immigrants brought diverse religious affiliations to the state. Norwegians were mostly Lutheran, Germans both Lutheran and Roman Catholic, Poles Roman Catholic, and Southerners and Easterners non-Lutheran Protestant. This diversity continues, and churchgoers are divided almost equally among these religious groups.

From the Great Depression of the 1930s to the late 1960s, northern Wisconsin generally lost population, but since that time the downward trend has reversed. Much of the Western Upland and the Central Plain show increases. Although the southeast continues to increase in population, the rate of increase has slowed, and the historic flow of migration from the north and the west to the southeast appears to have stopped. A migratory trend common throughout the nation is the continued movement from urban centres to suburban areas.

Migratory trends

The economy.   Wisconsin's economy has shown stability. The three major economic enterprises are manufacturing, agriculture, and the tourist-recreation industry. Although the production of durable goods, the state's major type of manufacturing, fluctuates with the economy, this fluctuation tends to be balanced by the processing of agricultural and forest raw materials (largely papermaking), in which there is less fluctuation. The major markets for Wisconsin's products, the sources of most of its energy supplies, and a high proportion of its raw materials lie outside the state, creating inward and outward flows that keep the state in close harmony with the nation's overall economy. It ranks among the top one-fourth of the states in farm income and value added by manufacture.

The state has a comprehensive economic policy. Efforts have been directed in general toward retaining and creating jobs, upgrading the labour force through vocational and technical education and job training, improving the business climate by controlling state spending and taxation, aiding small and minority businesses, adding maximum value to raw materials before shipment out of state, promoting tourism development, and assisting international trade and investment.

Resources. Iron is no longer mined in Wisconsin, but nonmetallic minerals such as sand and gravel, building and monumental stone, and agricultural lime are important to the state's economy. One of the 10 largest ore bodies of zinc-copper massive sulfide in North America, containing 5 percent zinc and other minerals, was discovered in northern Wisconsin in 1976. Although 75 percent of the forests are hardwoods, paper pulp is the major timber product. In commercial fishery, most of it in Lake Michigan, the lake trout and whitefish are prized. Most of the state's electrical power is generated in coal-burning plants, although a significant amount is produced in the state's three nuclear facilities. Only a minor percentage comes from hydroelectric plants.

Industry, agriculture, and tourism. The major producers of income in Wisconsin are manufacturing and processing, wholesale and retail trade, services (covering much of tourism), government, and construction. Manufacturing is concerned mainly with the production of metal goods and with the processing of agricultural and forest products. Agriculture is largely dairy farming, which requires a high degree of skill and efficiency. About four-fifths of farm incomes is derived from livestock and livestock products, three-fifths from dairy products alone. Among the features of Wisconsin highways and communities are stores specializing in cheeses of all kinds, wide varieties of wurst (sausage), and similar products, many of them manufactured locally. In addition, Wisconsin is one of the major beer-producing—and consuming—states in the nation, a reflection of its strong German heritage.

Tourism emerged in the mid-20th century and now ranks with manufacturing and agriculture as one of the major economic enterprises. It is promoted by the Division of Tourism Development through information centres in seven entry cities and Chicago and by the issuance of periodicals, brochures, films, and slides. Available for recreational use are some 117,000 acres in state parks and millions of acres in national, state, and county forests. Most of the public forests are in the north, with most of the parks in the southeast near the population concentra-

tions, although there is a park within an hour's drive of any location.

Forestry and fisheries. Pulpwood production dominates the Wisconsin timber industry, accounting for more than half of the timber cut, mostly aspen and pine. Sawtimber is mostly from hardwoods, such as red oak, aspen, hard maple, and elm; the smaller softwood supply is most notably white pine. Fuelwood production in the state is also significant, having surged with the energy crisis of the late 1970s.

Commercial fishing has been restored to some degree in Wisconsin's portion of the Great Lakes after its near elimination by the sea lamprey from the 1940s to the '60s. Since that time there has been a vigorous restocking of lake trout; whitefish have also made a comeback, as have lake herring, yellow perch, and chub. Average commercial catches of these fish have come to compare favourably with those preceding the lamprey scourge. The introduction of Pacific coho, (chinook) salmon, and other game fish into Lake Michigan has met with surprising success, causing a boom in the sport fishing industry, which now surpasses commercial fishing in the economy.

Transportation. Transportation route patterns concentrate toward the southeast, with Milwaukee and Chicago as the focal points, reflecting the greater population density and industrial concentration of that area. Intercity bus service is widespread, and the larger cities have intracity service. Two interstate highways cross the state. Wisconsin ports handle more than one-fourth of the domestic freight tonnage on the Great Lakes; the largest are Duluth (Minn.)–Superior, Milwaukee, and Green Bay. Madison, Milwaukee, and several smaller cities are served by major airlines; regional and commuter lines provide service to outlying areas.

Administration and social conditions. *Government.* The first Wisconsin constitution of 1848 is still the basic law. Amendments are passed by both houses of two successive legislatures and approved by referendum. Constitutional officers, since 1970 elected for unlimited four-year terms, are the governor, lieutenant governor, attorney general, secretaries of state and treasury, and superintendent of public instruction. The legislature comprises the Senate of 33 members elected for four-year terms and the Assembly of 99 members serving two-year terms.

The Supreme Court, primarily an appellate court, consists of seven judges elected statewide for 10-year terms. The state also has a Court of Appeals and a Circuit Court of original jurisdiction. Appellate and circuit judges serve for six-year terms. There are some 200 municipal courts throughout the state.

Units of local government include counties, cities, villages, and towns. Counties, which are agents both of the state and the locality, are governed by elected boards of supervisors. Within a county all areas not part of a municipality are organized into towns, which usually coincide in boundary with the government townships. At annual town meetings qualified voters make policy decisions that are carried out by a three-member town board.

Local government

Nonpartisan office elections are held in the spring, partisan ones in the fall; both are preceded by primaries. Chosen in nonpartisan elections are judges, the state superintendent of public instruction, school-board members, county supervisors, and city, village, and town officers. All other officers are chosen on a partisan basis. Primaries are open; that is, a person may vote in the primary of any one party regardless of accustomed party affiliation or of how the voter plans to vote in the general election. Wisconsin political leaders who have gained national prominence embrace all reaches of the ideological spectrum, from the Progressive traditions of the La Follettes to the conservative senator Joseph McCarthy.

There are two systems of party organization, statutory and voluntary. Each voluntary party, which consists of dues-paying members, holds a state convention and develops a party platform, which is officially adopted at the statutory party platform convention.

Education. A kindergarten that opened in Watertown in 1856 is thought to have been the first in the United States. After the American Civil War, Milwaukee became

known as a kindergarten centre. Private academies proliferated in Wisconsin before the Free High School Law was passed in 1875. Overall responsibility for elementary and secondary education lies with the state's Department of Public Instruction, with local boards of education overseeing local districts.

Higher education

The major system of public higher education is the University of Wisconsin System, which in 1971 was combined with the Wisconsin State Universities System to create 13 four-year, degree-granting campuses, 13 two-year (Center System) campuses, and University of Wisconsin Extension. In addition there is a statewide vocational, technical, and adult education system. Among the major private degree-granting institutions are Marquette University (Milwaukee; founded 1857), Lawrence University (Appleton; 1847), and Beloit (Beloit; 1846), Carroll (Waukesha; 1846), Carthage (Kenosha; 1847), Ripon (Ripon; 1863), and St. Norbert (De Pere; 1898) colleges. The school of architecture located on the grounds of Taliesin, the home of Frank Lloyd Wright near Spring Green, is a mecca for both students and experienced architects.

Health and welfare. State and local human-service agency programs include public health and Medicaid; employment-oriented programs for the vocationally handicapped; integrated institutional and field/county service programs in corrections, mental health, and developmental disabilities; and economic assistance.

In 1982 the Department of Health and Social Services initiated the Community Options Program to establish and fund community-based noninstitutional alternatives to long-term care for the frail and disabled elderly. Persons who would otherwise be consigned to nursing homes are now afforded continued independence, dignity, and personal choice through a variety of local supportive services that enable them to remain in their own homes or other homelike settings.

In 1983 the legislature passed enabling acts for health maintenance organizations, bringing about a rapid growth statewide of these and other such groups. The competition among health care providers to lower medical costs resulted in reduced length of hospital stays, same-day surgery, fewer hospitals, and a springing up of 24-hour immediate care centres, ambulatory surgery centres, and day-care centres for the aged.

Cultural life. The settlers of Wisconsin represented extreme diversity in ethnicity, ranging from New Englanders and Southerners to immigrants of almost every European nationality. Those of like origin tended to settle in enclaves and to retain much of their transplanted cultural heritage,

The cultural milieu

which gave the state a wide variety in arts and art forms. As the population became more homogenized, these unique modes of expression were retained to a considerable degree, producing both a rich diversity and a widespread appreciation of the arts in general among the populace. Among Wisconsin natives who achieved national recognition in the arts are the writers John Muir, Thornton Wilder, and Edna Ferber, the actors Alfred Lunt and Lynn Fontanne, and the architect Frank Lloyd Wright.

The University of Wisconsin has reflected and enhanced the statewide interest in the arts. It was the first university in the country to sponsor an artist in residence, the painter John Steuart Curry (1936), followed by the pianist-composer Gunnar Johansen (1939) and others. It supports the Fine Arts Quartet in Milwaukee and the Pro Arte String Quartet in Madison, groups with an esteemed international reputation. Through University of Wisconsin Extension it has over the years sponsored artists', writers', and theatrical and dance groups throughout the state. In summer it operates music clinics for high school students from throughout the country.

In 1957 University of Wisconsin Extension was instrumental also in bringing into being the Wisconsin Arts Foundation and Council, which in 1970 became an official state agency known as the Wisconsin Arts Council. In 1973 it was designated as the Wisconsin Arts Board, an agency designed to administer aid to groups and individuals in the arts.

Milwaukee is a major arts centre. The spacious 19th-century Pabst Theater has been restored. The Performing Arts Center is a multipurpose facility, where the Milwaukee Symphony Orchestra, the Florentine Opera (the state's oldest performing arts organization), the Milwaukee Ballet, and the Bel Canto Chorus perform; the Magin Art Gallery is also located there. The 100-year-old nationally recognized Milwaukee Art Museum has a collection of European and American masters and of contemporary art. The Golda Meir Library on the University of Wisconsin–Milwaukee campus contains the near-priceless map collection of the American Geographical Society.

Many of the national groups continue to hold annual festivals. The William Tell Pageant by the Swiss in New Glarus features the production of Schiller's play *Wilhelm Tell.* Norwegians hold the Syttende Mai festival in Stoughton and perform the Song of Norway at the Cave of the Mounds near Mount Horeb. Annual festivals in Milwaukee include Summerfest, German Fest, Polish Fest, and the Holiday Folk Fair, the oldest and largest multiethnic festival in the country. Numerous arts-and-crafts fairs are held in centres throughout the state. The Wisconsin State Fair is held in August in the Milwaukee suburb of West Allis.

Ethnic festivals

Among the many historical sites and museums in the state is the Circus World Museum in Baraboo, which collects and displays artifacts and other materials from circuses around the world. Many of its wagons and other paraphernalia are used in Milwaukee's annual circus parade.

The sparsely settled expanses of northern and western Wisconsin are popular areas. Among the more interesting vacation areas is the Door Peninsula, between Lake Michigan and Green Bay, with miles of rocky shoreline and sandy beaches and five state parks. It is largely forested but has cherry and apple orchards, summer cottages, small coastal villages, arts-and-crafts shops, and a summer theatre. Another is sparsely settled, heavily forested northern Wisconsin. With clear streams and hundreds of lakes, it is the epitome of the Northwoods for outdoors people. The Wisconsin Dells in the Central Plain is a mecca for tourists. Its initial attraction was the rocky canyons cut by the Wisconsin River, to which have been added many amusement park features. One of the least-heralded areas of the state but one deserving more attention is the scenic hill-and-valley country of the Western Upland, with its steep, wooded slopes, bare rock bluffs and towers, and tree-lined back roads winding through quiet pastoral scenes that include preserved homes of Cornish lead miners and a renowned summer Shakespearean theatre—an area described as like an unofficial national park.

Professional athletic teams in the state include the Green Bay Packers (football), the Milwaukee Brewers (baseball), and the Milwaukee Bucks (basketball). In addition there are several minor-league baseball teams and collegiate teams of various schools, including the Big Ten Conference teams of the University of Wisconsin–Madison.

HISTORY

Prehistoric populations. The so-called Paleo-Indians arrived in what is now Wisconsin during or after the retreat of the last continental glacier. The relationship between the prehistoric Indians and those present when Europeans arrived has not been clearly traced. Those encountered by the Europeans were the Ojibwa (Chippewa), Menominee, Winnebago, Potawatomi, Kickapoo, Sauk, Fox, Illinois, Miami, Mascouten, Huron, Ottawa, and the Santee Sioux. Four of these groups remain—the Ojibwa, Menominee, Winnebago, and Potawatomi—plus four others who migrated from the east in the 1820s—the Stockbridge (Mahican), Munsee, Brotherton, and Oneida.

Early settlement. Wisconsin was visited by a French explorer, Jean Nicolet, in 1634 and was under French control until 1763, when it was acquired by the British. It was subsequently ceded to the United States by the Treaty of Paris in 1783. It became part of the Wisconsin Territory in 1836 and in 1848 the 30th state.

French control

Unlike the French and British, who were interested primarily in the fur trade, the Americans made profound changes: clearing the land for farms; building houses, roads, and towns; and cutting the timber for lumber. They quickly dispossessed the Indians of their land by treaties

and overwhelming military defeats. They occupied the land, initially in the southwest, as lead miners and subsequently as pioneer farmers. An influx of immigrants from northern Europe began in the 1830s and grew in volume through the following decades. By 1880 the agriculturally suitable areas had been largely delineated by settlement.

Political and economic maturity. As the slavery issue intensified, a new political party, organized at Ripon in March 1854, became the Republican Party in Wisconsin. From then until 1932, Republicans dominated most state and presidential elections. After the Civil War, partly in reaction against the growing economic and political strength of the railroads and big business, there emerged a deeply rooted political unrest. It culminated around 1900 in the

The Progressive movement

Progressive movement, which brought reformer Robert M. La Follette, Sr., to the forefront and resulted in the passage of bills that made the state a leader in social legislation. Among the bills was a corrupt practices act, a worker's compensation act, and the first state income tax law.

Although the Progressive movement was a strong political force in the state, it was part of the state Republican Party until 1934 when it separated to become the Wisconsin Progressive Party. In 1946 it rejoined the Republicans, but many adherents went instead to the resurgent Democratic Party. After more than 100 years of Republican near dominance, the Democratic Party then elected four out of six governors within 25 years and had a majority in the legislature much of the time. However, Republican presidential candidates have usually received greater support.

Another outgrowth of the Progressive movement was the "Wisconsin idea." Operating under the theme, "The boundaries of the university campus are the boundaries of the state," it was an effort to bring together the resources of state government, the university, and citizens' groups to solve social, political, and economic problems.

As agriculture developed through the southern two-thirds of the state, dairying with an emphasis on cheese production emerged. Since 1920 Wisconsin has ranked first in the country in dairying. In the 1870s commercial lumbering reached Wisconsin's northern forests. Timber exploitation continued for about 40 more years, leaving a devastated countryside that only since the mid-20th century has begun to recover, through the regrowth of timber and the establishment of a tourist-recreation industry.

Iron mining began in the north in the 1880s, and millions of tons of ore were shipped before the last mine of that area closed in the 1960s. Manufacturing, beginning with the small-scale processing of local raw materials, turned largely to metal fabrication and grew phenomenally in the southeast as population increased and markets expanded. The growing position of manufacturing reflects the gradual change from a rural to a predominantly urban society. The balance was reached and passed during the 1920s, and by 1980 approximately two-thirds of the population was urban.

Wisconsin, with its blend of human, social, political, and economic qualities within the context of a favourable natural setting, has proved to be viable as a state. There is an acceptable balance between agriculture and manufacturing, and forestry resources are being reestablished. The tourist-recreation industry, along with manufacturing and agriculture, has become a third major producer of income. Although state government conducts strategic planning and research on issues related to development, there is an increasing emphasis on community leadership as the catalyst for growth.   (Ro.W.F.)

THE SOUTHWEST

Arizona

Arizona is a land of contradictions. Although widely reputed for its hot, low-elevation desert covered with cacti and mesquite, more than half the state lies 4,000 feet (1,200 metres) above sea level, and it possesses the largest stand of evergreen ponderosa pine trees in the world. Arizona is well known for its waterless tracts of desert, but, thanks to many large man-made lakes, it has more shoreline and more boats per capita than almost any other state in the United States. Such spectacular landforms as the Grand Canyon and Monument Valley have become international symbols of the region's ruggedness; yet Ari-

The environment

zona's environment is so delicate that in many ways it is more threatened by pollution than are New York City or Los Angeles.

Arizona achieved statehood on Feb. 14, 1912, the last of the 48 coterminous United States to be admitted to the Union. It is located in the southwestern quadrant of the coterminous states, bordered by Utah on the north, New Mexico on the east, and the Mexican state of Sonora on the south. The Colorado River forms the boundary with California and part of Nevada on the west. Phoenix, situated in south central Arizona, is the capital. The state's name comes from *arizonac*, derived from two Papago Indian words meaning "place of the young spring."

Although the area of Arizona is the sixth largest in the Union—114,000 square miles (295,260 square kilometres)—the state has a relatively small population that is identified by demographers as urban rather than rural. Its romantic reputation as the last refuge of primitive society and old-fashioned, close-to-the-earth simplicity is at variance with the fact that, after the 1860s, the Arizona economy became industrial and technological long before it was pastoral or agrarian.

PHYSICAL AND HUMAN GEOGRAPHY

The land. Plate tectonics—the shifting of large, relatively thin segments of the Earth's crust—and stream erosion have done the most to create Arizona's spectacular topography. Specifically, the Pacific Plate and the North American Plate came into conflict and created the major tectonic forces that uplifted, wrinkled, and stretched Arizona's geologic crust, forming its mountain ranges, basins, and high plateaus. Over the centuries rivers and their tributaries have carved distinctive landforms on these surfaces.

Relief. To Arizona's two major physiographic divisions, the Colorado Plateau and the Basin and Range Province, local authorities add the Transition Zone (or Central Highlands). The northeastern two-fifths of Arizona is part of the scenic Colorado Plateau. Far less rugged than adjacent portions in Utah, these tablelands in Arizona consist mainly

Landforms

of plains interrupted by steplike escarpments. Although they are labeled mesas and plateaus, their ruggedness and inaccessibility have been exaggerated. The incomparable Grand Canyon of the Colorado River provides the major exception to what has proven to be an area easily traversed. Forest-clad volcanic mountains atop the plateaus provide the state's highest points: Humphreys Peak, 12,-633 feet (3,851 metres), in the San Francisco Mountains, and Baldy Peak, 11,590 feet, in the White Mountains.

More than 200 miles (320 kilometres) of the southern border of the Colorado Plateau is marked by a series of giant escarpments known collectively as the Mogollon Rim. West and south of the rim, a number of streams follow narrow canyons or broad valleys south through the Transition Zone and into the Basin and Range Province. The Transition Zone bordering the plateaus comprises separated plateau blocks, rugged peaks, and isolated rolling uplands so forbidding that they remained mostly unexplored until the late 19th century.

The Basin and Range region of the southern and western third of the state, containing the bulk of the population but none of the large canyons and mesas for which Arizona is famous, consists largely of broad, open-ended basins or valleys of gentle slope. Isolated mountains rise like islands in the desert plain.

Contrary to desert stereotypes, sand dunes cover less than 1 percent of the state, and stony desert surfaces are seldom visible. The younger soils of river floodplains provide the more desirable soils for agriculture.

Drainage. Virtually all of Arizona lies within the Col-

The Colorado Plateau has cool to cold winters and a semiarid climate. Average mile-high elevations and direct exposure to polar air masses can produce January mean high and low temperatures as divergent as the 46° F (8° C) and 19° F (−7° C) in Winslow. Year-round temperatures in Flagstaff are generally 30° F (17° C) cooler than those of Phoenix. Most of the region receives from 10 to 15 inches of rain annually, with the Mogollon Rim and White Mountains receiving the maximum for the state of 25 inches.

Because of the great amount of relief, climatic conditions within the Transition Zone vary widely over small areas. Despite its desert image, about one-sixth of Arizona is humid, much of it lying in the Transition Zone and adjacent high southern edge of the Colorado Plateau.

Plant and animal life. Considering the variety in relief and climate, it is not surprising to find similar diversity in the state's vegetation. About 10 percent of Arizona is forested, 25 percent woodland, 25 percent grassland, and 40 percent desert shrub. Elevations above 6,000 to 7,000 feet host forests of ponderosa pine, topped in the highest areas by Douglas and other firs, spruces, and aspen. From 4,500 to 7,500 feet in the northern half of the state, piñon pine and juniper predominate, while evergreen oak and chaparral grow between 4,000 and 6,000 feet in the central mountains. Plains grasses cover about one-third of the Colorado Plateau, and Sonoran or desert grass carpets the higher elevations of the basins. Mesquite trees have invaded many former grasslands in the south. Cacti grow throughout the state, with the greatest variety below 2,000 feet. Foothills in the Tucson–Phoenix area carry giant saguaro cacti of the Sonoran Desert, matched in areas of the northwest Basin and Range by dramatic stands of Joshua trees. Shrubs dominate the lowest portions of all areas: big sagebrush and saltbush in the Colorado Plateau, creosote bush in the Basin and Range.

Animal life is even more varied, with representatives of the Rocky Mountain, Great Plains, and Mexican ecological communities. Important larger animals are black bear, deer, desert bighorn sheep, antelope, and wapiti, or elk. The tropical coatimundi, a raccoonlike mammal, has spread northward into Arizona, while the javelina, or peccary (wild pig), is a favourite game animal in the south. Among the several cats, the bobcat and the mountain lion are most characteristic of Arizona. Coyotes, skunks, and porcupines abound, as do cottontails, jackrabbits, and several varieties of foxes. Lying along a major flyway, the state's southern border area is rich in birds, which attract thousands of watchers. Game birds include turkeys and a variety of quails and doves. Among native fish are the Arizona trout and the Colorado squawfish. Poisonous animals include the rattlesnake, scorpion, and Gila monster.

Settlement patterns. Despite Arizona's romantic image as a land of picturesque ghost towns and mining camps, isolated ranches, Indian reservations, and bucolic cotton and citrus farms, most of its population is concentrated in urban settlements. More than half of the state's people live in just one of the state's 15 counties—Maricopa, where Phoenix is located. Of the 15 counties, six collectively contain more than 85 percent of the state's population. Only a small number of people live on farms and ranches.

Most towns and cities have low population densities. Buildings of adobe can be seen in the older inhabited areas of southern Arizona, while Flagstaff and Prescott, northern Arizona cities settled by New Englanders in the 1860s and '70s, have Victorian homes that reflect the traditions and preferences of their first inhabitants.

Phoenix is the primary trade centre of the state. Its central location, extensive agricultural economy, and attractive vacation and retirement amenities have caused it to become one of the largest and fastest-growing urban areas in the Southwest. Tucson, while older and smaller, has acted as a doorway to Mexico and maintains well-developed commercial and medical ties with Sonora and other northern states of Mexico. Since 1970, its population growth rate has rivaled that of Phoenix.

The people. Arizona has no broadly observable cultural traditions of its own. Rather, the state has always been a cultural outpost that has reflected tastes, fashions, speech,

Rock formations in Oak Creek Canyon in the Coconino National Forest, Arizona.

orado River drainage system. The Gila River, with its major feeder streams—the Salt and the Verde—is, by far, the Colorado's main Arizona tributary.

The Black, White, and Verde rivers are the primary perennial tributaries of the Salt River, which enters the Gila River southwest of Phoenix. Only during the infrequent—and occasionally devastating—flood periods does runoff water advance downstream past the numerous dams built on the Salt's system. The Gila River rises in that part of the Mogollon Rim located in western New Mexico, and it includes another and smaller Mogollon Rim tributary, the San Francisco River. Two intermittent southern Arizona streams, the Santa Cruz and San Pedro rivers, flow northward into the Gila, while two other intermittent streams, the Agua Fria and Hassayampa rivers, drain central Arizona southward into the Gila. Dams and irrigation systems, except on rare occasions, leave the Gila River dry for most of its length.

The Little Colorado River—which drains the Mogollon Rim's lee side and flows from southeast to northwest into the Grand Canyon and the Colorado River—draws and transports little water from its large watershed. Because of the rain shadow effect on the Mogollon Rim's lee side, the Little Colorado usually is no more than a trickle and often is dry. Several other small and intermittent streams, such as the Bill Williams River, drain a large but arid part of western Arizona.

Climate. About half of Arizona is semiarid, one-third is arid, and the remainder is humid. The Basin and Range region has the arid and semiarid subtropical climate that attracts most winter visitors and new residents. Receiving more than 80 percent of the possible sunshine, January days have a mean maximum temperature of 65° F (18° C) in Phoenix. Occasional light frosts occur at most locations in the Basin and Range region in winter, and light rains interrupt the exceedingly dry springs and mildly dry falls. Daily maximum readings average 105° F (41° C) in Phoenix in July, and nighttime temperatures drop to an average of 78° F (26° C).

Moisture-laden air from the Gulf of Mexico appears in July, bringing more than two months of irregular but sometimes heavy thundershowers that are locally referred to as the "summer monsoon." Phoenix and Tucson receive about one inch (25 millimetres) of rain in July. Winter rains come from the Pacific.

Variety of natural life

The Salt and Gila rivers

religious preferences, political attitudes, and life-styles that have come from such diverse localities as Boston, New York City, Washington, D.C., San Francisco, and Los Angeles.

Until the last half of the 19th century, except for very small and scattered groups of indigenous Indians, almost all of central and northern Arizona remained uninhabited. Most of the Spanish occupation of the state was tentative at best and remained confined to a few intermittently occupied missions, presidios, and ranches in the Santa Cruz valley, south of Tucson. In fact, few enduring remnants of Spanish occupation existed in the region after 1859.

Not until the 20th century did the number of Hispanic residents in Arizona soar. Today most Arizonans of Hispanic heritage are Mexicans or descendants of Mexicans who have arrived since 1900. Relations between Mexicans and Anglos (the Hispanic term for English-speaking whites) have at times been strained in Arizona, but in general the two ethnic groups have a history of cordiality that has often been absent in other border states. While some communities have Mexican barrios (ethnic quarters, often characterized by severe poverty), most Mexican-Americans live in a variety of neighbourhoods and participate fully in Arizona's business, political, and social life. Intermarriage with Anglos is common. Although Mexican food, building styles, home furnishings, clothing, social customs, and music have been incorporated into the Arizona lifestyle, the great majority of people have been affected by Mexican culture in only a superficial way. If anything, the Mexican-American population has been attracted to mainstream American culture.

In no state in the Union is the presence of the American Indian more conspicuous. Although the Indians of Arizona, from the advent of the Spanish conquistadores to the 20th century, have been subjugated, badly exploited, and abused—much like American Indians elsewhere—total annihilation and permanent displacement did not result. Arizona ranks in the top three states in the number of American Indians, who also constitute one of the highest percentages of the total population. The Indians are grouped into 15 tribes on 17 reservations that range in size from the 85-acre (34-hectare) Tonto Apache reserve to the almost 15,000,000-acre reserve (nearly three-fifths of which lies in Arizona) of the Navajo. The latter tribe, numbering more than 92,000 in Arizona, presses vigorously to direct the development of its land and people, and the tribal government assumes complete responsibility in many areas of Navajo social and economic life. Among the remaining tribes the best known are the legendary Apache and the much-studied Hopi. Less well known are the Havasupai, who live at the bottom of the Grand Canyon; the Hualapai; the Yavapai; the Papago (Tohono O'odham); and the Pima tribes.

Arizona's black population constitutes less than 4 percent of the state's total. Although housing remains largely segregated, Arizona voluntarily desegregated the states's schools in the early 1940s.

The economy. Before World War II the focus of Arizona's economy was primary production—mineral extraction, lumbering, cattle raising, and growing crops. Since the late 1940s the focus has shifted toward manufacturing industry and service, the economy becoming one that better represents America's growing affluence and technology.

Resources. Metallic ores such as copper, zinc, and, to a modest degree, silver and gold traditionally have brought revenue to the state. Coal from the Black Mesa area of the Indian reservations in northeastern Arizona has become important, since coal-fired stations generate much of the electricity for the southwestern United States; the northeastern area also produces a small amount of petroleum.

Since the 1880s, northern Arizona's massive stands of ponderosa pine have made the lumber and pulp-paper industry a steady industry in the state. Rich alluvial soils, particularly in Yuma, Pinal, Pima, and Maricopa counties, have supported large and profitable agricultural operations. Since the late 19th century, people throughout the world have perceived the state's climate and landscape to be among its most valuable resources.

The natural geographic corridor created by the Colorado

Uplift together with its Mogollon Rim escarpment has made possible Arizona's irrigation projects and most of the state's hydroelectric power, including that generated by the Roosevelt, Hoover, and Glen Canyon dams. Altogether, 11 dams control the Mogollon Rim's runoff, impounding and diverting the water to provide flood control and lakes for water storage. This hydrologic pattern has been a source of much 20th-century political and legal trouble for Arizona, including years of litigation with California over rights for water that falls in Arizona. The state's internal sharing of water is also a major problem because groundwater has been largely depleted, particularly around Phoenix and Tucson, and there are no new sources of surface water. Cities have found it necessary to buy water rights from distant areas.

Agriculture and cattle raising. Good soil, plenty of irrigation water, and a long growing season enable Arizona to produce cotton, alfalfa, and a variety of grains, vegetables, fruits, and nuts. For many years citrus growing has remained an important and expanding part of the Arizona economy and, more recently, wine producers have enjoyed success with a number of varietal grapes. Livestock products include beef, dairy goods, and poultry and eggs. The average size of farms in Arizona is larger than that in any other state, and farmers use almost 90 percent of the state's precious water.

Industry. Between 1880 and 1950 the production of copper remained, by far, the most important industry in Arizona. Since then, however, manufacturing has grown to become the state's most important basic industry, notably in the electronics, communications, aeronautical, and aluminum industries. Although this growth has brought one of the most dynamic and affluent economies in the nation, many of Arizona's outlying counties, particularly those with large American Indian populations, remain among the poorest areas of the United States.

Tourism and retirement. Urban and industrial expansion have so polluted major areas of Arizona that it no longer serves as the refuge it once did for sick people seeking pure air. The climate, scenery, and casual life-style, however, still attract millions of visitors each year, and the state has become a popular retirement centre, particularly in the lower desert areas. Large "senior citizen" communities such as Sun City, near Phoenix, and Green Valley, near Tucson, have continued to grow.

Administration and social conditions. *Government.* The constitution of Arizona reflects the ideals of the progressive movement, which was influential at the time of the constitutional convention in 1910. It provides for maximum citizen participation through initiative and referendum on legislation and recall of all elected officials including judges. A reorganization of the state government in 1968 strengthened the power of the governor and streamlined the executive branch. The governor is elected for a four-year term. The secretary of state, who succeeds to the governorship in case of a vacancy, holds the second most highly contested elective office in the state. Other members of the executive branch include the attorney general, the state treasurer, the superintendent of public instruction, the state mine inspector, and the three-member corporation commission, which oversees public service corporations.

The legislature meets annually and comprises a 60-member House of Representatives and a 30-member Senate. The massive growth of Phoenix and Tucson, combined with reapportionment, has given urbanized Maricopa and Pima counties some three-fourths of the seats in both houses.

A constitutional amendment in 1960 restructured the judicial branch into the Supreme Court, the Court of Appeals, Superior Court, and local justice and other courts; there are no special courts. Judges of the Supreme Court and the Court of Appeals are appointed by the governor from nominees chosen by a commission. Other judges are appointed or elected.

The 15 counties, acting as agents of the state, constitute the basic units of local government. State law prescribes the town type of government for settlements of less than 3,000 people and the city form for larger communities.

Metropolitan centres have considerably more freedom in organization and operation.

Since the 1950s, Arizona has changed from a traditional one-party state dominated by the Democrats to a two-party system. Political dynamics, however, reflect the conflict between Maricopa county and the rest of the state more than any party differences. Republican strength is centred in the Phoenix area, but the party also receives support from rural, conservative "Pinto" (*i.e.,* "Spotted") Democrats. Democratic factions continue to receive support in Flagstaff, Tucson, some mining communities, and among traditionally Democratic Mexican-Americans and blacks.

Education.   Public education has struggled to meet the rapid increase in students accompanying the population boom. Children must attend school between the ages of eight and 16 or until graduation from the eighth grade. Elementary, secondary, and consolidated districts operate with the assistance of county and state superintendents and an appointed state Board of Education.

Higher education   Higher education in Arizona, as in most western states, is dominated by large public universities. The Arizona Board of Regents assumes responsibility for the University of Arizona (founded 1885) in Tucson, Arizona State University (1885) in Tempe, and Northern Arizona University (1899) in Flagstaff. The State Board of Directors for Community Colleges oversees nine county community-college districts, which operate more than 30 campuses, branch centres, and skill centres. There are few private colleges in the state.

Health and welfare.   The Arizona Department of Health Services, together with appointed boards, commissions, and councils, provides aid and inspection services, including a number of public health centres and hospitals. Private medical care in the metropolitan areas is excellent, but residents of rural areas and the reservations receive substandard medical services. Despite its attractiveness to the ill and the aged, Arizona has no more than its per capita share of the nation's hospitals and nursing homes. The College of Medicine at the University of Arizona and university-affiliated nursing programs work toward expanding the supply of medical personnel.

In 1981 the legislature created the controversial Arizona Health Care Cost Containment System Administration as an alternative to the federal Medicaid program. The system includes an insurance program designed to provide health care for those citizens who are indigent or who cannot otherwise afford adequate medical care. At the same time, it attempts to contain hospital and other medical costs. Arizona is the only state in the Union that does not participate in the Medicaid program, but it does receive some federal funding for its own system.

A generally modern approach to public welfare by the legislature has been coupled with financial restraints that limit the effectiveness of the programs. The Department of Economic Security works mainly through county agencies with a variety of programs for children and for the aged, blind, and disabled.

Cultural life.   Although traditionally a centre for Indian folk arts and crafts, Arizona has had no circles of painters and writers comparable to those of neighbouring New Mexico. Interest in painting, crafts, drama, music, and publishing, however, has increased with population growth. Architecture and the graphic arts have been particularly influenced by Southwestern regional themes. Almost none of this, however, reflects the tastes and attitudes of the people native to the state; for the most part, the artistic and literary designs and imagery have been developed and imposed upon the region by outsiders and immigrants such as the writers Zane Grey, Oliver La Farge, Mary Austin, and Edward Abbey. A few native-born writers of the 20th century, such as Marguerite Noble and Eva Antonia Wilbur-Cruce, have contributed to a genre that emphasizes the real hardships of the region.

Indian arts and crafts   Contemporary Indian arts and crafts, executed within the traditions of the tribes, receive worldwide praise. In particular, Hopi and Navajo painters, silver and jewelry craftsmen, weavers, basketmakers, and potters produce a high volume of much-desired and expensive work.

No city dominates as an art centre, although Scottsdale, Tucson, Sedona, and Tubac have colonies of working artists; Flagstaff is home to a number of well-respected photographers. Paintings can be viewed in the Phoenix Art Museum. The Arizona State Museum at the University of Arizona in Tucson, the Heard Museum in Phoenix, and the Museum of Northern Arizona in Flagstaff feature archaeological and traditional collections of Indian arts and crafts. Symphony orchestras, theatres, ballets, and opera are well supported in Phoenix and Tucson.

More than any other art form, architecture embodies the relationship between the regional traditions of the Southwest and modern international trends. Several fine examples of Frank Lloyd Wright's work—including his home at Taliesin West—and the futuristic city of Arcosanti designed by Paolo Soleri are found in Arizona. Among the many structures in the Spanish style, the Heard Museum is outstanding, and the Nogales Public Library synthesizes the Spanish Southwestern and contemporary styles. Probably the most photographed building in all of Arizona is the San Xavier del Bac Mission (popularly called the "White Dove of the Desert") located near Tucson and completed by the Franciscans in 1797.

The state's leading book publisher, the University of Arizona Press, releases a variety of scholarly and popular titles, most with a Southwestern focus. The state's most widely known publishing venture, *Arizona Highways,* brings varied features of Arizona to a worldwide audience.

A variety of sports and recreational activities provide entertainment and leisure. Varied desert and forest terrains and many man-made lakes attract thousands of hunting and fishing enthusiasts, campers, hikers, and amateur prospectors and historians throughout the year. Arizona has more national parks and monuments than any other state; among the best known are the Grand Canyon and Petrified Forest national parks and the Chiricahua, Montezuma Castle, and Saguaro national monuments. The Arizona–Sonoran Desert Museum in Tucson has received worldwide attention as a living museum dedicated to the natural world of the Sonoran Desert. Rodeos revive the spirit of the Old West in all of the cities and on the larger Indian reservations.   (M.E.H./J.W.B.)

HISTORY

Early settlement.   *Prehistoric peoples.*   Although the region's physical traits may appear inhospitable, even repulsive, to habitation and subsistence, Arizona contains some of the oldest records of human occupation. Relics of material culture are evidence that humans most likely have lived in Arizona for more than 25,000 years. For most of this prehistoric period, these people lived in caves and hunted animals, many species of which no longer exist. Scholars believe that the Cochise culture, made up of people living in what is now southeastern Arizona, began more than 10,000 years ago and lasted until 500 BC or later.

During the past 2,000 years, prehistoric societies developed within Arizona that were highly organized and advanced. Many of these Indians lived in durable masonry villages called pueblos (from the Spanish word meaning "town" or "village"). Arizona has become one of the most intensively excavated parts of the New World for archaeological research on this period. This group of prehistoric cultures, which are better known than their predecessors, includes the Hohokam, Anasazi, Mogollon, Sinagua, and Patayan. The nomadic Apache and Navajo Indians arrived in the region in the 16th century.

Hohokam, Anasazi, and other cultures

The Spanish period.   The documented record of the European explorers and settlers of this region began in Mexico during the second quarter of the 16th century with Spaniards who wrote about the legend of El Dorado and the Seven Cities of Gold. In 1539 Fray Marcos de Niza, a Franciscan priest, entered Arizona in search of riches and Indians to convert to Christianity. Finding the Indians to be hostile, Fray Marcos returned to Mexico. One year later Don Francisco Vásquez de Coronado led a large, well-armed expedition to Arizona in an effort to claim for Spain what is known today as the American Southwest. Members of Coronado's expedition visited the

Grand Canyon and the Hopi pueblos. In 1583, Hopi Indians guided the Spanish explorer Antonio de Espejo to the site of present-day Jerome. He was disappointed to find copper and other nonprecious metal ores instead of the gold he sought. By 1675 several Franciscan missionaries had established themselves at the Hopi villages, but five years later the Hopi revolted and drove the Spaniards out. In the early 1700s Roman Catholic missionaries established churches in the upper Santa Cruz valley in southern Arizona. During this period other Hispanics also settled there. Later in the 18th century priests visited various parts of northern Arizona, including the Hopi villages, but made no serious attempt at religious conversion.

After the successful revolution that brought Mexico's independence from Spain in 1821, the new government ordered the missions in Arizona to close. Arizona was ceded to the United States as part of New Mexico in 1848. Following the Gadsden Purchase in 1853, when Mexico sold Arizona's southernmost region to the United States, only a few scattered and isolated Mexican-American ranches, all located near the Mexican border, remained.

The
Gadsden
Purchase

Modern Arizona. Until the Mexican War (1846–48) only a few Americans—explorers, soldiers, trappers, sheep drivers—had visited Arizona. In 1851 the U.S. Army Corps of Engineers sent several expeditions into Arizona to find a suitable route on which to build a wagon road to California. To protect travelers, miners, and other settlers from Indians, the U.S. government began to locate army posts at key sites. In 1883, workers completed the Atchison, Topeka and Santa Fe Railway across northern Arizona, thereby linking St. Louis, Mo., with California; that same year the Southern Pacific Railroad completed a line from New Orleans, La., to Los Angeles by way of Tucson and Yuma.

The copper era. Copper, Arizona's premier industry until the 1950s, was first mined in Arizona at Ajo in 1854. The Planet mines opened on the banks of the Colorado River about the same time. By 1876 the Clifton-Morenci district in eastern Arizona had two large-scale mining operations. Copper mines in Globe and Jerome, both in central Arizona, also developed rapidly. The richest copper find of all occurred in 1877 in Bisbee, in southeastern Arizona near the Mexican border. By 1880, national and international advances in electrical engineering and the availability of the necessary investment capital had created a vigorous demand for copper that had not existed earlier. Arizona began to satisfy a rapidly growing copper market; the state still mines and processes more than half of the copper produced in the United States.

Commercial agriculture. During the 1870s a few homesteaders, including a number of Mormon immigrants from Utah, attempted to develop farming economies along Arizona's few streams and rivers. Droughts, floods, and the need for heavy capitalization made it clear that for commercial farming to succeed in the state it would have to be practiced on a large scale, be highly organized, and be at a high technological level. To do this, central Arizona agricultural interests developed plans for large waterstorage and flood-control systems that included expensive dams and extensive canal systems. The Salt River Project, completed in 1911, delivered water to farmers in the Phoenix area, which since has become the state's agricultural heartland. Water shortages continued to plague the state, however, and in 1963, after a long and bitter fight with California, the U.S. Supreme Court affirmed Arizona's right to 2,800,000 acre-feet of water annually from the Colorado River, as well as the entire flow of the Gila River. In 1968, after a lengthy and heated debate, the U.S. Congress authorized the Central Arizona Project, a massive system of pumps and canals to conduct water from the Colorado River to the Phoenix and Tucson areas.

Salt River
and
Central
Arizona
projects

Range cattle constituted a major source of income for Arizona from the 1860s until World War II, when large feeder lots became prominent. These lots have begun to disappear, however, and today Arizona's range cattle constitute only a small percentage of the nation's edible beef.

Population growth. After Arizona achieved statehood in 1912, it soon began to tout itself as the place of the "five Cs": copper, cattle, cotton, citrus, and climate. Health seekers from the rest of the nation discovered that the clear, clean, dry air of Arizona brought relief from various respiratory ailments, and the foundation was laid for the large number of immigrants and visitors that continues to infuse money into the state. During the 1920s "motor courts," dude ranches, and resorts grew up to accommodate increasing numbers of tourists, winter residents, and retirees. Because of its climate and its distance from the nation's coasts, Arizona became the site of several World War II flight schools and other U.S. government military bases. Following the war, a surge of immigration from other states—particularly from the Midwest—changed Phoenix into one of the fastest growing urban areas in the United States. It is a persuasive argument that the development and use of refrigeration and air conditioning did more than anything else to make Arizona attractive and habitable.

Many people think of the state as a romantic getaway fraught with images of noble Indians, heroic cowboys, and a Mexican "mañana" atmosphere. Arizona, however, has never been free from the curses of an urban and industrial society. Were it not for such technological developments as railroads, copper smelters, atomic reactors, automobiles, refrigeration, computers, and hydroelectric turbines, few people would be living in the state today.

Although many newcomers anticipate a land of personal fulfillment, the state's rates of divorce and crime, for example, are consistently among the nation's highest. Arizona is attempting to build a modern society in an arid land and, at the same time, to preserve as much as possible a beautiful natural landscape and a desired quality of life that easily could be sacrificed in the process of demographic growth and development. Unquestionably, Arizona's major problem is the limit of the state's ability to support a growing population in a way that does not bring deterioration to those characteristics that made Arizona attractive in the first place.   (J.W.B.)

New Mexico

A state of the American Southwest, New Mexico is part of the "Old West" of cattle drives, cowboys, and clashes between pioneers and Apache Indians. In the vast flatness of its Great Plains and the rough, weather-scored peaks of its mountain ranges, it still retains much of its frontier flavour. Severe tensions and increasingly frequent confrontations between its Spanish-American (Hispano), Indian, and Anglo (*i.e.,* English-speaking white) populations are a continuing reminder of the bitter antagonisms that characterized its long history and were still unresolved when it became the 47th state in the Union in 1912.

Frontier
flavour

The 121,593 square miles (314,925 square kilometres) of New Mexico make it the fifth largest of the U.S. states; it has only 258 square miles of water. Rectangular in shape except for a small panhandle in the southwestern corner, New Mexico is bounded on the north by Colorado, on the east by Oklahoma and Texas, on the south by Texas and the Mexican state of Chihuahua, and on the west by Arizona, which was part of the Territory of New Mexico from 1850 to 1863. At its northwestern corner it joins Arizona, Utah, and Colorado in the only four-way meeting of states in the nation.

Despite the traditionally agrarian nature of the state, augmented by successful irrigation methods, New Mexico has become urbanized. Large numbers live in Albuquerque and surrounding Bernalillo county. The capital, Santa Fe, is a much smaller city, but its founding in 1610 preceded that of Albuquerque by 96 years, and it is the oldest continuously used seat of government in North America. It was also the southwestern terminus of the Santa Fe Trail, a wagon trail that was a major commercial and migration route from Missouri to the Southwest from 1821 to 1880, when the railroad was completed.

PHYSICAL AND HUMAN GEOGRAPHY

The land. *Relief.* New Mexico has some of the flattest land in the world and also some of the most rugged mountains. Some portions have pine forests, rich meadows, and fish-laden mountain streams, while other areas are devoid

of streams, and even cacti struggle to survive. The eastern third of the state is an extension of the Great Plains that includes the Llano Estacado, or Staked Plains. The Rocky Mountains extend into the northern centre, the ranges interspersed with valleys and running in a north–south direction. The rest of New Mexico is a high plateau, but it also contains many plains and short mountain ranges.

The average elevation ranges from 5,000 to 8,000 feet (1,500 to 2,500 metres) above sea level in the northwest to less than 4,000 feet in the southeast, with 85 percent of the state more than 4,000 feet above sea level. The highest mountain peaks, Wheeler Peak (13,161 feet [4,011 metres]) and Truchas Peak (13,102 feet), are in the Sangre de Cristo range in the north-central part of the state. The lowest elevation, of 2,841 feet, lies in the southeastern corner of the state. The numerous valleys between the ranges are indispensable to agriculture and grazing. Unique volcanic formations abound as reminders of past lava flows. The caverns near Carlsbad are among the most spectacular natural rock formations in the world, while wind and water erosion have created one of the world's most extensive gypsum sand dunes at White Sands National Monument.

The Rio Grande

Drainage. Five major river systems—the Rio Grande, Pecos, Canadian, San Juan, and Gila—drain the state. The Rio Grande, which has played an influential role in New Mexico's history, virtually bisects the state from north to south. Agriculture in its floodplain has been significant since prehistoric times; European settlers initially lived exclusively in its valleys and those of its tributaries. The Pecos, east of the Rio Grande and approximately parallel to it, was also a popular route for explorers. The Canadian River, rising in the Sangre de Cristo range and flowing east across the arid plains, was a useful avenue for explorers despite its deep canyons. The San Juan and Gila rivers lie west of the Continental Divide, in the northwest and southwest, respectively. All but the Gila, which is not dammed in New Mexico, provide water for irrigation, recreation, and flood control.

Climate. New Mexico's pleasant climate has long been one of its greatest attractions, especially for those seeking a comfortable retirement or relief from respiratory and other ailments. Although New Mexico's average annual temperature is 54° F (12° C), extremes range from 116° F (47° C) to −50° F (−46° C). Variations are caused more by altitude than latitude, with temperatures falling by about 5° F (3° C) with every 1,000-foot increase in elevation. Nighttime temperatures tend to fall sharply. The average annual rainfall is 13 inches (330 millimetres), though precipitation tends to increase with elevation. About 40 inches of rain falls in the higher mountains, whereas lower areas may get no more than eight to 10 inches. Generally, precipitation is greatest in the eastern third of the state and least in the western third.

Plant and animal life. New Mexico has six vegetation zones, which are determined mainly by altitude. The Lower Sonoran Zone, in the southern sections of the Rio Grande and Pecos valleys and in the state's southwestern corner, usually occurs at altitudes below 4,500 feet. It includes nearly 20,000 square miles of New Mexico's best grazing area and irrigated farmland. The Upper Sonoran Zone, comprising about three-fourths of the state and including most of the plains, foothills, and valleys above 4,500 feet, is a region of prairie grasses, low piñon pines, and juniper shrubs. At higher altitudes, better stands reflect the more abundant rainfall. The Transition Zone, covering some 19,000 square miles, is identified chiefly by the ponderosa pine. The Canadian Zone, covering 4,000 square miles at elevations of 8,500 to 9,500 feet, contains blue spruce and Douglas fir. The Hudsonian and Arctic-Alpine zones, above 9,500 feet, are too small in area and too sparsely covered to be of great importance.

Wildlife

The diversity of natural vegetation and elevation is reflected in the state's wildlife. Mule deer, brown bear, bighorn sheep, mink, muskrat, fox, mountain lion, and bobcat live in the mountain and forest areas above 7,000 feet, while at lower elevations antelope, coyote, and jackrabbit are found. Barbary sheep from North Africa have been introduced into several mountain areas. Many species of trout are common in the mountain streams, and

Soap-tree yucca (*Yucca elata*) growing in the gypsum sand of White Sands National Monument, New Mexico.
Tom Algire

warm-water fish abound in lower streams. Approximately 300 species of birds can be found year-round, including various game birds. Rattlesnakes and black widow spiders are common. Despite the establishment of federal and state parks, forests, and refuges, many of New Mexico's animal species and subspecies are endangered.

Settlement patterns. The first Spanish settlers—in the central valley of the Rio Grande and its tributaries—were awarded land grants by Spain and Mexico that have been contested throughout New Mexico's history. The Spanish-speaking inhabitants are still concentrated in the north central portion of the state. The eastern third of the state, often referred to as the "East Side," is an extension of the High Plains of West Texas and was originally settled as a cattle frontier after the Civil War. It continues to attract Protestant Anglos from Texas as ranchers, farmers, or oil-field workers, and they are often at odds with the Spanish-American Roman Catholics of Albuquerque and Santa Fe. The southwestern corner of the state, settled by Anglo miners after the coming of the railroads, also has little in common with the central area. The northwest corner received Mormon settlers from Colorado, but the greatest growth of this area resulted from oil and natural gas discoveries after World War II.

Early settlers remained along streams because of the scarcity of water elsewhere. In a typical community adobe houses opened onto a plaza from which four streets ran outward, and the entire enclave was enclosed by a wall for defense. Nearby were small agricultural plots and orchards owned by individuals. Just beyond was the ejido—land for communal grazing, recreation, or firewood. Despite fear of Indian attack, ranches away from settlements often were established. At the time of the American conquest, New Mexico was a self-sufficient agrarian community, with most people residing in small villages.

Spanish villages

After the Civil War, vast cattle ranches appeared on the East Side, their size limited only by the availability of water. The coming of the railroads in 1879 brought several waves of Anglo farmers, but frequent droughts ruined many who tried to till the soil as they had in their more humid homelands. Dry farming—tilling that uses drought-resistant crops or otherwise conserves soil moisture—saved many who remained, but today irrigated farming is the most important form of agriculture.

The people. The people of New Mexico are primarily

Anglos, Spanish-Americans, or Indians, with blacks numbering only about 2 percent of the population. The original Spanish settlers intermarried with the Indians, and their descendants are designated as Spanish-Americans or Hispanos rather than Mexican-Americans, as elsewhere in the Southwest. Spanish-Americans were in the majority until the 1940s, and people of Hispanic heritage still make up more than one-third of the population. After World War II an influx of Anglos accompanied a widespread desertion of small agricultural villages by their Spanish-speaking residents, who moved to urban centres in the state or to California. Many such villages became ghost towns.

Indian population

Indians constitute less than 10 percent of the state's population. The large Navajo reservation extends over the northwestern corner into Arizona, and nearby Gallup is known as "the Indian capital of America." There are also reservations for the Ute and for the Jicarilla and Mescalero Apache; Pueblo Indians live on nearly 1,900,000 acres (769,000 hectares) of scattered land grants. The Indians preserve many of their ancient ways, tending flocks of sheep and producing handicraft items. But dissatisfaction with their low income, inadequate housing, poor health standards, and lack of educational opportunity has led to a growing militancy and an increasing exodus from their reservations or pueblos to urban centres.

New Mexico, traditionally rural, has joined the national trend toward urbanization. Nearly one-half of the population now lives in the metropolitan areas of Albuquerque, Santa Fe, and Las Cruces, with some one-third in the Albuquerque area alone. Urbanization has involved a number of factors: the movement of Hispanos away from their rural homes, the consolidation of farms, and the increasing inclination of many farmers to abandon their isolation for the larger towns and commute to their fields and flocks.

The economy. New Mexico is a comparatively poor state. Its economy is similar to that of a developing nation in that it is largely at the mercy of forces over which it has little control. Relying heavily on the export of raw materials and on federal expenditures for programs of no certain permanence, New Mexico is subject to shifting demands from outside the state. Government spending accounts for nearly one-fourth of the state's economy.

Agriculture. In 1540 Francisco Vásquez de Coronado, the Spanish explorer of what would become New Mexico, ably described the greatest concern of the local population as the need for water, and the modern farmer is no less dependent on the water supply than was the Indian of ancient times. The Indians and Hispanos were self-sufficient farmers, growing beans, corn (maize), cotton, and squash on the alluvial plain of the Rio Grande. Efforts to raise crops with New Mexico's rainfall (a technique called dry farming) have usually failed, and most fields are irrigated. The arid land was best used for pasture, and sheep thrived until well into the 20th century. The Anglos brought cattle raising from Texas, and the sale of the cattle and calves accounts for more than one-half of the marketing receipts from agricultural products. Wholesale milk is second in value, followed by hay, chile, and wheat.

Gold and silver mining

Mining. Spanish exploration and settlement of New Mexico were prompted in part by a quest for precious metals. Even the naming of the land reflected Spanish hopes that it would be as rich in minerals as Mexico. Some mining was carried on under the Spanish and Mexican colonial governments, but only after the Civil War did gold and silver extraction become important. The mining brought many settlers and attracted capital in territorial days but never produced the riches expected. Gold and silver continue to be significant but are mainly recovered as by-products of copper smelting. Copper mining also began in the 19th century; copper is found in many parts of the state, although most of the ore reserves and production are in Grant county, in the southwestern corner.

In an area lacking wood, coal has long been an important fuel. Coal production soared with the coming of the railroads but declined after the fuel source shifted from coal to diesel oil. Production almost ceased for a time but has again become important as a fuel for thermoelectric power generation.

New Mexico produces about 85 percent of the nation's potash. Since the discovery of uranium deposits in 1950, it generally has led the nation in uranium production. Iron ore, lead, zinc, manganese, and molybdenum are also mined, but oil and natural gas account for about 50 percent of the state's mineral income. Natural gas is mainly produced in the southeastern corner and in the San Juan basin in the northwest.

The ups and downs of past mineral production have been repeated in New Mexico several times. Boom times in the mines, oil fields, or natural gas fields have been often succeeded by depression.

Industry. Manufacturing in New Mexico was originally limited to the production of consumer goods, but it has increased since World War II. Food processing, petroleum refining, smelting, and the manufacture of electronic components, communication equipment, and construction materials are leading industrial activities. Nuclear weapon and energy research is carried on at the Los Alamos National Laboratory and the Sandia National Laboratories in Albuquerque. An offshoot of this is the private manufacturing of such products as ordnance, electronic equipment, and precision instruments. Unions are not widespread and are confined largely to the mining, smelting, and petroleum industries.

Tourism and recreation. New Mexico attracts millions of visitors annually. For many years Texans, fleeing hot, humid summer weather, have been drawn to the crisp, cool mountain resorts of the state. Many people come to New Mexico in the summer to fish, camp, admire the magnificent scenery, or attend the various festivals and rodeos. Indian ceremonials are major attractions. State and national parks, monuments, and historic sites also draw countless tourists. Hunters come in the fall seeking the great variety of game birds and animals. During the winter the state's ski runs attract enthusiasts. Tourism has flourished so extensively that some suggest it has become, in terms of cash receipts, New Mexico's leading industry.

Transportation. Geographic isolation was a basic cause of New Mexico's slow economic development. In the Spanish and Mexican periods, it took about six months to travel the distance between Mexico City and Santa Fe. The Santa Fe Trail route was much shorter and faster, and American consumer goods helped prepare the way for conquest. This isolation ended when the railroads reached Albuquerque and Santa Fe in 1880. Today an extensive rail network unites the state. Highways link New Mexico's major population centres; three of these highways are part of the federal interstate system. Mountainous terrain makes road construction expensive, but secondary roads are adequate. Air transportation provides a vital link with other parts of the nation.

The Santa Fe Trail

Administration and social conditions. *Government.* New Mexico's constitution was adopted in 1911. In most instances it can be amended by a majority vote of the legislature and by a majority vote of the electorate. A public referendum on major issues is permitted, but public initiative on legislative matters is not. Nomination to office is by closed primary.

The governor has more authority than those of most states. The governor has the usual powers of pardon, reprieve, and veto, and in addition appoints most of the state boards, departments, agencies, and commissions. Consequently, the governor is the virtual master of patronage and the political organization. Like the lieutenant governor and other executive officials, the governor is elected for one four-year term. Officials are ineligible for state elective positions for four years thereafter, with the exception of the lieutenant governor, who may run for governor.

A legislature composed of 42 members of the Senate, elected to four-year terms, and 70 members of the House, elected to two-year terms, meets for a 60-day session in odd-numbered years and a 30-day session in even-numbered years. Heading the judiciary are five Supreme Court justices elected for eight years, with overlapping terms. Judges of the 13 judicial districts are elected for six years and serve ex officio as judges of juvenile courts.

Most of New Mexico's 33 counties are administered by an elected board of commissioners. Other county elective officers are assessor, clerk, sheriff, surveyor, treasurer,

and probate judge. In the territorial era citizens usually favoured Republicans, but Democrats have tended to dominate since statehood. Each of New Mexico's Indian groups elects a tribal council, which administers tribal affairs such as local government and represents the tribe in negotiations with the federal and state governments.

Education. A public school system was established in 1891, and today the educational standards in the urban centres are comparable with or superior to those in the other Western states. Many rural and small-town schools remain substandard, however. One reason for this is that many school districts cover large, sparsely populated areas, and students often live far from their schools. In addition, many country schools are located in the poorer areas of the state, where learning may be secondary to survival. Because Hispanos are dominant in such areas, education is poorer for their children. Legalized segregation for the Hispanic minorities ended in the 1950s, but de facto segregation often remains, primarily on the elementary-school level.

Colleges
and
universities

The state's largest institution of higher education is the University of New Mexico in Albuquerque, established in 1889. Other state-supported institutions include New Mexico State University (1888) in University Park and the New Mexico Institute of Mining and Technology (1889) in Socorro. Northern New Mexico Community College at El Rito, originally established in 1909 to train Hispanic teachers, has branches at Española and Santa Fe. The state universities have established branch campuses, while some cities have organized junior colleges. There are also several private colleges.

Health and welfare. The state's department of health, created in 1919, administers an extensive social service program, often in collaboration with federal agencies. Most of New Mexico's hospitals are in urban areas, and medical services in rural areas are generally inadequate. The Emergency Health Communication network links emergency vehicles, including helicopters, with medical facilities throughout the state. Other state institutions include a penitentiary, an industrial school for boys, a girls' welfare home, schools for the blind and the deaf, a development centre for mentally retarded children, and several special state-supported schools.

Cultural life. Writers and architects have been influenced by New Mexico's Indian and Hispanic heritages, which in turn have been influenced by Anglo culture. The appearance of cowboys and miners, and the conflicts of the frontier territory in the 19th century, have also been dominant cultural themes. Painters have been concerned especially with the unique landscape, since few other areas of the United States present such a variety of scenery or so many modes of life existing side by side. New Mexico's cities have attracted artists from many parts of the nation and the world. Taos was the first to have an important art community, but it is now rivaled by Santa Fe and Albuquerque. The state institutions of higher education, through their libraries and their departments of art, music, dance, and theatre, have played a key role in the dissemination of cultural knowledge. This has been accomplished directly and through the training of public school teachers. The success of the Santa Fe Opera, which had its first season in 1957, reflects the growth of musical appreciation. The company performs in an outdoor theatre in the Sangre de Cristo Mountains near the city, presenting a repertory that has won the group worldwide acclaim.

The historical atmosphere of New Mexico and its fusion of three cultures is represented by its unique architecture. Indian pueblo buildings were modified by Spanish settlers when they built Santa Fe, and many of these original structures have been restored. The statehouse, most public buildings, and many private ones have been constructed in the modified Spanish mission style.

Indian
arts

Local Indians produce beautiful pottery of high quality. Each village has its own design to identify the work of its people. Navajo blankets are famous throughout the world. Many Indians make buttons, beads, pins, rings, necklaces, earrings, and belts, mainly for sale to the growing number of tourists. The United States Indian Arts and Crafts Board has attempted to preserve the authenticity

of Indian jewelry by establishing standards in handworked silver. Individual pueblos preserve traditional dances by performing at numerous fiestas, the most important being the Intertribal Indian Ceremonial, which draws thousands of visitors to Gallup every summer.

Spanish folk art has been preserved largely by the Penitentes, a religious group within the Roman Catholic church. In rural areas medieval Spanish music and art also have been preserved.

In most counties there are museums stressing history, Indian arts, or subjects of local interest. The Palace of the Governors in Santa Fe, part of the Museum of New Mexico, helps preserve archaeological artifacts, mementos, and folk arts of the past. The state archives also contain important relics. The Wheelwright Museum of Navajo art is in Santa Fe. In Taos is the Kit Carson Home and Museum, a history and art museum featuring Indian and Spanish art and 19th-century Western furniture.

HISTORY

New Mexico's first inhabitants were various groups of Indians who farmed and hunted on the land for at least 10,000 years before white explorers appeared. The more peaceful agriculturists included the later groups, whose pueblo ruins dot the state. These groups had well-developed irrigation systems by the time the more aggressive and nomadic Navajo and Apache arrived from the north, probably in the 15th century.

Spanish and Mexican rule. Reports of the fabled seven cities of gold brought the first European explorers into New Mexico in 1540, led by the Spanish adventurer Francisco Vásquez de Coronado. The journey was fruitless, and they returned to Mexico. After several decades of desultory exploration by soldiers and friars, Juan de Oñate was given contracts for colonization in 1595 and made the first permanent white settlements during the following years. Santa Fe was established as the permanent capital in 1610.

Colonial
period

For the next century missionary work predominated, but attempts to eradicate Indian religion and culture brought on an uprising and massacre in 1680 that cleared out the Europeans for a time. By 1700, however, the Spanish had reasserted themselves, and for the next century there was considerable settlement. Albuquerque, founded in 1706, was the focal point in the south, and Santa Fe was the centre of the north.

Subsistence agriculture in the valley of the Rio Grande and its tributaries was supplemented by the raising of sheep and horses. Trade with the Comanche to the east brought consumer goods (probably from French traders) in exchange for wool, furs, and horses. The Spanish population increased rapidly, possibly to 25,000 by 1800, making New Mexico several times more populous than the colonies of Texas and California. Although there was substantial trade with Chihuahua, Mex., Spanish authorities usually neglected this important frontier province.

Agricul-
ture, trade,
and the
economy

Although French traders from New Orleans, La., made inroads into the economy of Santa Fe, a greater threat to Spanish New Mexico came from attacks by the Apache and Comanche. Some 100 soldiers garrisoned at Santa Fe were powerless to halt the Indian forays. In 1806–07 Lieutenant Zebulon Pike led a small detachment of U.S. Army troops into New Mexican territory. After his capture and imprisonment for illegal entry into Mexico, Pike wrote a report about the Mexican southwest that brought American fur trappers and traders into the area. When New Mexico became a part of the Republic of Mexico, founded in 1821, it already had begun to trade with the United States over the Santa Fe Trail, and this trade led to still another allegiance 25 years later.

Territory and state. During the Mexican War, which began in 1846, New Mexico was taken by the Army of the West under General Stephen Kearny. All residents were granted amnesty and citizenship in return for an oath of allegiance to the United States. The Territory of New Mexico was established by Congress in 1850. During the Civil War an invading Confederate force was driven out by the Colorado Volunteers.

The Navajo tribes were quelled and in 1868 were given a large reservation; but the Apache, settled on two reser-

vations in 1880, continued their struggles until 1886. The burgeoning cattle industry was the main development of these decades, and the territory often was bloodied by battles between cattlemen and sheepmen, large landowners and homesteaders. The legendary Billy the Kid and his lawman-nemesis, Pat Garrett, were products of this struggle. The Apache leaders Geronimo, Cochise, and Victorio, though mainly active in Arizona, made forays into southwestern New Mexico. The Atchison, Topeka and Santa Fe Railway, which reached Albuquerque in 1880, brought new immigration, and farming grew rapidly with the development of new irrigation methods and resources.

Following admission as a state on Jan. 6, 1912, New Mexico retained its agricultural basis and its frontier image. In some isolated areas, stagecoaches still made connections with trains and cowboys herded cattle on the ranches, some of them vast enterprises. The Hispanic communities were little touched by the changes brought by statehood, and Indian culture was little altered by the events of the new century. There were, however, forces at work that were to materially change the state and its people.

Effects
of the
automobile The automobile soon ended the isolation of even the most remote Hispanic village or Indian pueblo. Young people moved to the city, and farm products were more easily marketed by truck. The disruption brought by the motor car was continued in the 1930s by the New Deal, the many relief programs of which brought most rural New Mexicans into contact with government for the first time.

World War II acted as a catalyst to speed the changes already under way. Young Hispanic and Anglo men were conscripted into the military, and others found employment at government installations in New Mexico or in the war plants in distant states. Research facilities included that at Los Alamos, the centre of the project that created the first atomic bomb in 1945. Since then, many of the military activities have been continued. There also has been an increase in the exploitation of oil, natural gas, and other mineral resources and an expansion of agriculture through improved irrigation.   (W.A.B.)

Oklahoma

In its land and its people, Oklahoma is a state of contrast and of the unexpected. The terrain varies from the rolling, timbered hills of the east, where the state borders Missouri and Arkansas, to the treeless high plains that extend into Texas and New Mexico to the west. Oklahoma's east central region is dominated by the lowlands of the Arkansas River, sweeping in from Colorado and Kansas on the north, and by the Red River, which forms nearly all of its southern border with Texas. Once basically agricultural—and the dust-bowl locale of John Steinbeck's famous novel *The Grapes of Wrath*—Oklahoma now has hundreds of lakes and a diversified economy.

The word Oklahoma is derived from two Choctaw Indian words: *okla*, "people," and *humma*, "red." During the 19th century the future state was a symbol of one of the least glorious chapters in American history, becoming known as Indian Territory, the dumping ground for Indian
Territory Indian tribes displaced by white settlers' ever-increasing hunger for land. Since its admission in 1907 as the 46th state of the Union, however, Oklahoma has achieved an integration of its Indian citizens into modern economic and social life that probably is unmatched by any other state. There is no reservation in the usual sense for the Indian population. Though numbers of "blanket Indians" may possess no more than their bedrolls, others have risen to positions of distinction. Many share in the great wealth that oil resources have brought to the state.

Oklahoma covers an area of 69,956 square miles (181,-186 square kilometres). The customs of the Deep South are maintained in the habits and attitudes of southern Oklahoma—"Little Dixie"—despite the decline in cotton production. The customs of the wheat growers in the north, however, reflect their largely Kansan origins.

PHYSICAL AND HUMAN GEOGRAPHY

The land.   Lying in a transitional zone in topography, climate, and other features, both east to west and north to south, Oklahoma comprises a jumble of environments.

Relief.   Three of the nation's large physical regions extend into or across the state. The Interior Highlands is in the east; the Coastal Plain, extending through Texas to the Gulf of Mexico, is in the south; and the Interior Plains, including the Central Lowland and Great Plains, cover the remainder. Ten subregions lie within Oklahoma. Three are mountainous and in the south—the Ouachita, Arbuckle, and Wichita mountains—and are characterized by rough topography and thin soils; lumbering, grazing, some farming, and mining are their principal economic activities. The northeastern Ozark Plateau, most of which lies in Missouri and Arkansas, has rough terrain and small fields devoted primarily to growing fruits and vegetables. Once important as a lead and zinc producer, the plateau has a Cherokee heritage and beautiful rivers that make it a major recreation and tourist attraction.

The Sandstone Hills, a wide band stretching through the east central portion between the Red River and the Kansas border, is poor in agriculture and timber but important for its oil, gas, and coal deposits. The region is sprinkled with deserted or dying oil-boom towns, with Tulsa a prosperous exception. The sparsely populated Gypsum Hills section of western Oklahoma is devoted largely to grazing and farming, with large wheat acreages in the north and smaller cotton farms in the south.

The remaining four areas are flat to rolling and are agricultural. The Red River Plains, once the area of the best farmlands in the state, has been depleted by cotton. Its agriculture has been diversified by the addition of peanuts (groundnuts), melons, and vegetables grown on medium-sized plots. Its population is relatively dense, with many small towns serving as trade centres. The Prairie Plains region in the northeast is marked by grazing in its rougher portions and vegetable farms in the river valleys. Oil and gas fields are common, as is strip-mining for coal. It contains a number of middle-sized towns, some of which have small manufacturing plants. The Red Beds region is the largest, running through the middle of the state. The greatest population density is located there, as are most of the larger towns. Oil provides much of the income. Although cotton rules in the south and wheat in the north, corn (maize), watermelons, sorghum, alfalfa, vegetables, and livestock are common. The High Plains region of the northwest and the Panhandle offers a marked contrast.

Oil rig in a wheat field near Okmulgee in east central Oklahoma.

With the highest elevation and the least moisture, the eastern portion is dominated by wheat and natural gas production, and the western by grazing.

Oklahoma's drainage pattern, consisting of the Arkansas and Red rivers and their tributaries, slopes from an elevation of nearly 5,000 feet (1,500 metres) in the northwest to about 300 feet in the southeast.

Climate. Rainfall varies from more than 45 inches (1,140 millimetres) annually in the Ouachitas to less than 20 inches in the Panhandle. Wheat and sorghum predominate in the drier western sections, peanuts thrive in the middle areas, and corn, soybeans, vegetables, and berries grow in the damper east. Irrigation has made corn a successful crop in the dry Panhandle. Virtually all of the regions have enough water for grass; hence, ranching is common.

Oklahoma has a southern humid belt merging with a colder northern continental one and humid eastern and dry western zones that cut through the state. The result is normally pleasant weather and an average annual temperature of about 60° F (15.5° C), increasing from northwest to southeast. No region is free from wind; and, as the collision point for warm and cold air masses, with sudden rises and falls in temperature, the state has heavy thunderstorms, blizzards, and tornadoes.

Plant and animal life. Oklahoma is a transitional area for plant and animal life. More than 130 species of trees are native: the eastern forests of maple, sweet gum, hickory, oak, and pine change into the cottonwood, elm, hackberry, and blackjack and post oaks of the grasslands. The arid-zone plants are chiefly mesquite, sage, and cacti. Among animals are deer, elk, antelope, rabbits, coyotes, wolves, foxes, prairie dogs, and American bison. Native fish include bass, perch, catfish, and buffalo, and virtually every bird common to the land between the Mississippi and the Rockies is found. Horned toads, lizards, many varieties of nonpoisonous snakes, and rattlesnakes and cottonmouth moccasins are native.

Settlement patterns. The outlines of roads and farms generally produce a pattern of unusual symmetry in the landscape, revealing the original survey divisions into townships, sections, and quarter sections. Small squares predominate where small-scale farming is common and very large ones where wheat and ranching prevail. As elsewhere in the nation, however, the trend has been toward urbanization. The Red Beds in the centre of the state grew most rapidly, and three of the state's four largest cities are found there, the exception being Tulsa.

Oklahoma City, the capital, is near the centre of the state and in area is one of the larger cities areas in the nation. Banking, insurance, manufacturing, trade and transportation, state and federal installations, and educational facilities have made it the commercial and industrial heart of the state. Tinker Air Force Base, located in nearby Midwest City, is the metropolitan area's largest employer. Lawton is a centre for the Fort Sill Military Reservation, the Wichita wildlife recreational centre, and the rural population of the area. Norman, seat of the University of Oklahoma and site of the major state mental hospital, is also a bedroom city for Oklahoma City and Midwest City commuters. Tulsa, a former Creek Indian village in the Sandstone Hills region, grew slowly until the discovery of oil nearby. Refineries and facilities for manufacturing and distributing oil-field supplies have made it the headquarters for many oil companies, and it has many other financial and industrial functions. Enid is the home of Vance Air Force Base and is the marketing centre for a prosperous agricultural community.

The people. Most of Oklahoma's Indians live in the former Indian Territory in the eastern part of the state. The Plains tribes remain in western Oklahoma. Some Indians live on tribal landholdings that are informally called reservations. Most blacks in the state are descended from slaves of the Five Civilized Tribes (the Cherokee, Choctaw, Chickasaw, Creek, and Seminole), although some migrated from the South after 1865 and others came during the land runs that began in 1889. The majority live in urban centres or in the southern and eastern parts of the state, and several towns have entirely black populations.

A wide variety of other racial and ethnic strains have contributed to Oklahoma's population. The original French claimants left their names and bloodlines, usually in conjunction with Indian families, and a mining boom in the 1870s brought Europeans into the Choctaw Nation. Descendants of these Italian, Slavic, Greek, Welsh, Polish, and Russian miners still live in Little Dixie. The land runs brought homesteaders from China, Japan, Mexico, England, France, and Canada, and the spread of wheat farming attracted German Mennonites and Czechs to the northwest. By the 1980s, sizable groups of Mexicans and Vietnamese had arrived. Nearly all of Oklahoma's residents, however, reflect a typically Midwestern American culture.

The state's religious sects bear out this trend toward conformity. Of the Protestant majority, the Southern Baptists and the United Methodists predominate, and the resulting conservatism has placed Oklahoma in the Bible Belt. (This fundamentalism was a primary cause for Oklahoma's retention of the prohibition of liquor sales until 1959.) Other leading denominations include the Disciples of Christ, Assemblies of God, Churches of Christ, and Episcopalians. Roman Catholics and Greek Orthodox are represented throughout the state, but Jewish congregations are limited to the cities. Most Indians have adopted some form of European religion, although the Native American church—in which use of the drug peyote is a part of the worship—is recognized by state charter. The sun and ghost dances of the western tribes reflect earlier religious practices and reactions to white settlement.

The economy. Oklahoma is one of the nation's younger states, and its economy is not as balanced as those of older, more prosperous areas of the country. There has in the past been overdependence on agriculture and petroleum, but the efforts of state and local officials to attract new forms of industry have shown some success.

Agriculture. Traditionally, agriculture has furnished an important part of Oklahoma's income, though Oklahoma's farms, which are slightly larger than the nation's average in size, have slightly less value per acre. In line with national trends, the averages are likely to remain the same, but the number of units will probably continue to decline. In commercial agriculture, livestock ranks first, followed by wheat, dairy products, peanuts, cotton, and other field crops and general produce.

Industry. Oklahoma remains somewhat of an economic satellite of the industrial North and East, furnishing food, raw materials, and fuels. Despite great efforts to diversify—for example, the manufacture of transportation equipment has become important—the state still has far to go. Only about 14 percent of its workers are in manufacturing, lower than the national average. Wholesale and retail trade employ the greatest number of people, followed by services, manufacturing, transportation and public utilities, finance, insurance and real estate, mining, and construction.

Oklahoma ranks high nationally in the value of mineral production, which includes petroleum, natural gas, natural gas liquids, coal, and stone. Commercially exploitable timber primarily consists of softwoods. The first major commercial pulp and paper plant in the state was established in 1970. Oil and gas production historically has been the major component of Oklahoma's economy. Fluctuations in oil prices—such as those in the 1980s—have tended to reduce the importance of oil and gas and cause widespread economic depression, characterized by a large number of bank failures in Oklahoma.

Transportation. Oklahoma's transportation facilities help account for its favourable record in attracting new industry. The state has well-developed networks of roads and highways and of railroads. Tulsa and Oklahoma City act as the major collection and distribution points. Several airlines provide direct flights for passengers and freight to most cities. Intricate networks of pipelines move the petroleum products, and a barge system links Tulsa to the Gulf of Mexico by way of locks and dams on the Arkansas River.

Administration and social conditions. *Government.* The general structure of the state constitution (1907) is similar

Moisture and ecology

Major cities

Ethnic and religious groups

Margin notes (right column):

Manufacturing and labour organization

to that of other states, but Oklahomans strengthened the legislature by limiting the governor's appointive powers and ability to succeed himself, although the latter prohibition was removed in 1966, and by making the judiciary elective. Also unusual is the right of initiating legislation by popular initiative and referendum. The governor is elected for four years. The 48 senators serve staggered four-year terms, and the 101 house members serve two years. The original 75 counties, later increased by two, are represented through house districts. Constitutional provision was also made for township and city governments, though the former was abolished in 1913. This constitution, often amended, is still in force.

Oklahoma politics

Since statehood Oklahomans have favoured the Democrats. Even when the state supports Republican presidential nominees, normally that party can hope for only one or two congressional seats, and it was not until 1962 that it won the governorship. Oklahomans have a history of giving strong support to third parties; in 1914 the Socialists received 52,703 votes, and in 1968 the Southern states' rights candidate, George Wallace, received more than 20 percent of the total vote.

A major governmental change was the revision of the state's court system in 1967, which abolished justices of the peace and established selection of major judgeships according to what has become known as the Missouri Plan. Under this plan judges are nominated by a joint commission chosen by the governor and the state bar association rather than by the political parties. The state Supreme Court has exclusive appellate jurisdiction in civil cases, while the Court of Criminal Appeals has exclusive appellate jurisdiction in criminal cases; in both courts judges are elected for a term of six years. The Court of Appeals, with a judge elected from each congressional district, hears only cases assigned to it by the Supreme Court, and there is no appeal from its decisions to other state courts. Lower courts include 24 district courts, with judges elected on nonpartisan ballots. In 1966 county attorneys were replaced by district attorneys.

For financial support of its functions, Oklahoma relies basically on taxes on petroleum, natural gas, gasoline, income, and sales. Property taxes are used largely for the support of county, municipal, and school needs. A major check on spending since 1941 has been Oklahoma's "budget-balancing" amendment, by which the legislature is forbidden to appropriate more money than in the previous year plus estimated additional revenues.

Education. Supervision of public schools is conducted by elected state and county superintendents, and higher education is coordinated by the regents for higher education, appointed by the governor. The state university

Higher education

system is often regarded as inadequate in relation to the state's needs and resources. Exceptions are the University of Oklahoma (founded 1890) in Norman, and Oklahoma State University (1890) in Stillwater. Both have a large number of graduate departments ranked above average in achievement. Private institutions enroll only about one-fifth of the college population.

Health and welfare. The Department of Mental Health has general charge of mental hospitals in Norman, Vinita, and Fort Supply. The Department of Human Services and the Department of Corrections administer social welfare and penal programs. In spite of a generally conservative attitude toward federal intervention in local social questions, most federal welfare programs operate in Oklahoma. In addition, more than 100 recognized agencies or groups within the state have resulted from minority initiative by Indians, blacks, and Hispanics.

Cultural life. Oklahoma is a blend of the old and new. Cowboys and Indians may be seen at numerous rodeos and at annual performances of Red Earth or at the American Indian Exposition. As host of the annual exposition and the site of Indian City U.S.A., the National Hall of Fame for Famous American Indians, and the Southern Plains Indian Museum, Anadarko is a major tourist attraction. Among the features are full-sized reproductions of the homes of various tribes, pictures and busts of their leaders, and extensive displays of their artifacts. Western historical collections are maintained by the University of

Oklahoma and by the Oklahoma Historical Society in Oklahoma City. The National Cowboy Hall of Fame and Western Heritage Center, at Oklahoma City, is noted for its Western art and its exhibits of cowboy paraphernalia. The Will Rogers Memorial museum at Claremore features exhibits depicting early Oklahoma and Rogers' career as a cowboy and entertainer.

Oklahoma's best-known graphic artists are Indian, and Indian works as well as those of European masters are represented in many museums. Oil has made the state influential on the international petroleum landscape, but those that it has enriched have contributed much to the artistic scene. The Thomas Gilcrease Institute of American History and Art and the Philbrook Art Center, both in Tulsa, and the Woolaroc Museum, in Bartlesville, originally reflected individual tastes, but they have joined other art museums (notably the Oklahoma Art Center in Oklahoma City) in offering wide-ranging displays.

Symphony orchestras are supported in Tulsa, Lawton, Enid, and Norman. A public-school music program culminates each spring in the Tri-State Music Festival. Several ballerinas of international fame are of Oklahoman Indian descent, the most noted of whom are Yvonne Chouteau, Rosella Hightower, and the sisters Maria and Marjorie Tallchief. Theatres have been sources of entertainment since frontier days. Universities and civic groups continue to provide a wide variety of dramatic experiences and professional training. Several towns feature annual folk plays or pageants, while Tulsa boasts an opera company with a regional reputation. The Tulsa Little Theater has given more than 50 years of uninterrupted productions. The state is unusually active in literature, with numerous writers' clubs, poetry societies, and folklore groups.

The performing arts

Oklahoma has a wide variety of recreational opportunities and actively seeks tourists from other states. Parks range from mountainous to arid land. Among popular natural features are the Little Sahara Recreation Area and Great Salt Plains and Quartz Mountain state parks. Not the exclusively arid state that some imagine, Oklahoma has an active program of water impoundment and now boasts canoe trails, fishing tournaments, and more shoreline than the Atlantic coast. There are also many ethnic celebrations, as well as nationally known college teams in football, basketball, and wrestling.

HISTORY

Early habitation and European exploration. Of the newer states, Oklahoma is one of the oldest in terms of human occupation. The abundant game of its plains attracted hunters of the Clovis and Folsom cultures 15,000 to 10,000 years ago. Others followed, producing between AD 500 and 1300 a golden age of exquisite pottery, textiles, sculpture, and metalware. Evidence indicates a widespread system of trade and communication. This high culture apparently fell before the onslaught of primitive peoples from the western plains, and until the expedition of Francisco Vázquez de Coronado in 1541 the region's population included representatives of at least three major Indian language groups.

Coronado claimed the area for Spain, but it became little more than a highway for wide-ranging Spanish explorers. In 1714 Juchereau de Saint Denis visited Oklahoma, and other Frenchmen subsequently established a fur trade with the Indians. France and Spain struggled for control until 1763, leaving only the natives to contest Spanish authority until the return of the French flag in 1800. Three years later, through the Louisiana Purchase, Oklahoma was acquired by the United States.

American dominion. As one of the purchase's most attractive parts—because of trade opportunities—the area might well have become one of its first states; but it was, in fact, the last. Because of hostile Indians, Spanish intrigue, the mislabeling of its treeless plains as the American Desert, and the pressure for removal of the Indians from the settled East, the U.S. Congress in 1828 reserved Oklahoma for Indians and required all whites to withdraw. By 1880 more than 60 tribes had joined the local ones in Indian Territory. Some were sedentary, peaceful, agricultural, and semi-Europeanized; others were

Indian Territory

migratory and belligerent. Indian Territory consisted of five republics, or nations, with fixed boundaries, written constitutions, courts, and other governmental apparatus similar to those of the Eastern states. The major difference was that in each republic all land was held jointly or in severalty by an individual tribe. The first major threat to these governments came when, as former allies of the South during the American Civil War, they were placed under military rule during the Reconstruction period.

The Reconstruction treaties required, among other things, land cessions to the former slaves, the resettlement of additional outside tribes, and railroad rights-of-way. Although a scheme to colonize free blacks in Oklahoma never materialized, the weakness of the Indian governments encouraged both blacks and whites from adjoining states to trespass. Thus, the territory again became a dumping ground for Indians and an even greater cultural hodgepodge of red, white, and black people.

White settlement and statehood. Railroads seeking revenue and whites seeking property coveted the Indians' land. By 1879 organized bands, the Boomers, were moving in despite federal law. Although most were ejected, pressure continued until Congress opened some 2,000,-000 acres (800,000 hectares) of western Indian Territory, bringing on the famous land run beginning at noon on April 22, 1889. Known as Oklahoma Territory, the new area came to include, through further land runs, about half of the former Indian domain. Then its settlers, many called Sooners for entering the area before official permission, sought union of the two territories in statehood. The remaining Indian Territory was dissolved by assignment of lands to the various tribes, and the Indians joined in approving the constitution of the proposed state in 1907.

The drought years of the 1930s blighted many rural areas of Oklahoma, driving thousands of farmers into long migrations in search of some form of livelihood. The economic boom of World War II, however, allowed the economy to diversify. This diversification was marked by the growth of the oil and natural gas industry, which suffered setbacks in the 1980s. The major political development of the postwar period has been the growing strength and assertiveness of Oklahoma's Indian population.   (J.S.E.)

Texas

The vastness and diversity of Texas, the largest state in the Union except for Alaska, are evident in nearly all aspects of its physical character, its history, and the economic and social life of its people. As an example, January temperatures in the Rio Grande valley have been known to register well over 90° F (32° C), while at the same time, nearly halfway to Canada, blizzards were blocking highways in the Panhandle section of the state. The image of Texas was that of a raw and lawless frontier when, in 1845, it surrendered its status as an independent republic to become the 28th state of the United States. This picture has altered drastically in the 20th century and now combines great agricultural wealth, major oil and natural gas production, high national rankings in industry and finance, huge urban centres that foster a cosmopolitan cultural life, and seemingly unending stretches of high prairie and range devoted to cattle and cotton.

Texas, with the fourth longest seacoast among the 48 coterminous states and a large shipping industry to match, occupies the south-central segment of the nation. Its 266,-807 square miles (691,030 square kilometres) make it larger than any nation in Europe with the exception of Russia. Water delineates many of its borders: the Rio Grande carves a shallow channel that separates Texas from Mexico on the southwest; the Gulf of Mexico laps its crescent-shaped coast on the southeast; the Sabine River forms most of the eastern boundary with Louisiana, where by land it is bounded by Arkansas as well; and the wriggling course of the Red River on the north makes up two-thirds of the state's boundary with Oklahoma. The Panhandle section juts northward, forming a counterpart in the western part of Oklahoma, and New Mexico lies to the west.

The name of the state derives from the Spanish name (from an Indian word meaning "allies" or "friends") for an Indian group. Austin is the state capital. Texas is commonly divided into East and West, although the dividing line between the two is ambiguous. Generally, though, East Texas has a wet climate and is characterized by cotton and ties to the Old South, while West Texas is dry and is characterized by cattle ranching and an affinity to the West.

PHYSICAL AND HUMAN GEOGRAPHY

The land. *Relief.* Far from being merely wide, arid plains that are filled with cattle and cowboys, Texas comprises a series of gigantic steps, from the fertile and densely populated Coastal Plains in the southeast to the high plains and mountains in the west and northwest.

Stretching inland from the Gulf Coast, the Coastal Plains range from sea level to about 1,000 feet (305 metres). These flat, low prairies extend inland to form a fertile crescent that is well adapted to farming and cattle raising. Near the coast much land is marshy, almost swamp, except where drained by man-made devices.

The western anchor of the Coastal Plains is the Rio Grande valley, where a heavy investment in citrus farming occasionally is damaged by disastrous freezes. It now features diversified farming, with vegetables and citrus. The low coastal lands between Port Lavaca and Port Arthur are ideal for rice cultivation. Inland from Houston the flatlands provide grazing for fine-breed cattle. Forests of pine and cypress grow extensively from Beaumont to the Red River and spill into Louisiana and Arkansas, making lumbering and paper mills important industries.

Access to water transportation, reservoirs of natural gas and oil, and availability of raw materials have made the coastal area the centre of industry in Texas. It is also the most densely populated part of the state. Houston, Texas' largest city, is a focal point, while Fort Worth, Dallas, Waco, Austin, and San Antonio form a line at the inner edges of the Coastal Plains. Corpus Christi, Galveston, and the Beaumont–Port Arthur–Orange complex augment Houston's port, one of the nation's largest.

The Coastal Plains, encompassing about two-fifths of the state's land area, break abruptly at the Balcones Escarpment, where in the distant geologic past the surface of the Earth cracked and slipped. Northwest of the fault, the land rears up into the Texas Hill Country and then into the tablelands of the Edwards Plateau to the south and the North Central Plains to the north. These last two regions are extensions of, respectively, the Great Plains and the

Agriculture on the coast (margin note)

Texas longhorn cattle grazing at the head of Fresno Canyon, Trans-Pecos region, Texas.

Central Lowlands. The entire region varies from about 750 to 2,500 feet above sea level. Farming and livestock raising constitute the basic economy. The Hill Country mixes orchard crops with ranching, small industries, summer camps, and tourism.

At the western edge of the North Central Plains lies the Cap Rock Escarpment, an outcropping of rock that stretches to the north and south for about 200 miles (320 kilometres). Protruding above the plains like a huge barricade, it is starkly visible in some places in cliffs that rise from 200 to almost 1,000 feet. Beyond that escarpment lies the third big step of Texas: the High Plains country and, to the south, the Trans-Pecos region.

From the High Plains country of West Texas emerged many of the legends of Texas weather and of the Texas cowboy. In this region lies the flat, dry area known as the Llano Estacado (Staked Plains). According to legend, as the Coronado expedition moved westward, it laid down stakes to serve as guides for the return trip, and even Indian tribes hesitated to venture across these lands. On these plains, sandstorms can obstruct vision in midday, filter tiny bullets of sand into the best-built homes, and scour the paint from exposed automobiles. Many wide, flat riverbeds remain dry most of the year, but they can become sluiceways for flash floods. Through the northern portal, beyond Amarillo, "blue northers" sweep out of the Rocky Mountains with a frenzy of freezing wind, ice, and snow. In the 19th century such famous ranches as the XIT, the Spur, the JA, and the Matador spread their cattle over these ranges.

The North Plains subdivision, centred around Amarillo, depends on grain farming, ranching, oil, and small industries. The South Plains subdivision, with Lubbock as the principal city, has large underground water reservoirs that allow large-scale irrigated cotton farming.

The state's most rugged terrain lies to the west of the Pecos River. Trailing down from the Rockies, the Guadalupe Mountains lead into mountains of the Big Bend country, a name that is derived from a loop of the Rio Grande. The highest peak in Texas is Guadalupe Peak, which rises 8,749 feet (2,667 metres) above sea level. Big Bend National Park preserves the native ruggedness of the region.

Soils. There is immense variation in the types of Texas soil. The Piney Woods region of East Texas has a gray and tan topsoil that covers the red subsoil usually within a foot or two of the surface. The soil along the upper and middle Texas coast is black clay or loam, with lighter-coloured sandy soil on the coastal islands, bars, and spits. The soil of the southern Texas coast and inland to the Rio Grande is sandy, like that of East Texas, but is less eroded and leached.

The Blackland Prairie, a belt of fertile black clay to the west of the Piney Woods, extends southwesterly from the Red River to San Antonio. The soil of the Grand Prairie region, just to the west of the Blackland Prairie, is more rocky and resistant to erosion.

The Cross Timbers, a forest region with light-coloured, slightly acid, sandy loam soil, stretches across the prairies of northern Texas, enclosing part of the Grand Prairie. Red sandy and dark clay soils are found in the Llano Basin, in the centre of the state. The Edwards Plateau has thin, stony soil with a limestone bedrock.

Most of the soils of the western North Central Plains are red or tan-coloured and sandy, but some black clay is found in the region. The High Plains, just to the west, has dark brown to reddish clay loams, sandy loams, and sands. In the Trans-Pecos region are found reddish brown sandy soil in the mountains and grayish brown to reddish brown clay soil in the basins.

The rich fertility of the soils first attracted settlers to Texas. Much of the soil was lost through wasteful practices in the 19th and early 20th centuries, but since the 1930s efforts by federal and state governments have done much to promote soil conservation in the state.

Climate. Generalizations about the weather in Texas are almost meaningless. The Gulf Coast area around Houston has an average annual temperature of about 70° F (21° C) and rainfall of 45 inches (1,145 millimetres), whereas the Panhandle averages about 60° F (16° C) and less than 20 inches of rain. The driest region is the Trans-Pecos country, and the wettest is the southeast. Southern areas have freezing weather only rarely. In Brownsville, the southernmost city, no measurable snow has fallen in the 20th century, but the northwestern corner averages 23 inches annually.

Plant and animal life. A great variety of vegetation is found in Texas due to differences in the amount of rainfall and type of soil. Native longleaf, shortleaf, and loblolly pine provide most of the commercial timber in East Texas. A belt of post oak grows just west of the pine woods, as do blackjack oak, elm, pecan, and walnut. Marsh and salt grasses are found along the Texas coast, with bluestem and tall grasses growing a little farther inland.

The region south of San Antonio was originally brush country with mesquite, small live and post oak, prickly pear cactus, bluestem, buffalo grass, and bunchgrass. Irrigation in the 20th century has resulted in extensive vegetable and fruit production along the lower Rio Grande.

Bluestem, grama, Indian grass, switch grass, and buffalo grass grow in the prairies and plains regions of West Texas. Oak, pecan, elm, Osage orange, and mesquite are native trees found in the prairies and the Cross Timbers region. Cedar, mesquite, yucca, cactus, and some islands of cypress make up the vegetation of the Edwards Plateau. Desert plants provide much of the vegetation of the Trans-Pecos region. Piñon pine, ponderosa pine, spruce, cedar, and oak grow in the higher mountains of the region.

Some 550 species of birds (nearly three-fourths of all species found in the United States) have been identified in Texas. Among the more exotic are the once nearly extinct whooping cranes that winter in the protected Aransas National Wildlife Refuge, near Corpus Christi. Ivory-billed woodpeckers once found in East Texas are believed to be extinct.

Many of the domestic animals that are important in the economy of the state—cattle, horses, sheep, goats, and hogs—were introduced by the Spanish, but more than 100 mammals are native to Texas. Some, such as the bison, black bear, mountain lion, pronghorn, and red wolf, almost disappeared in the late 19th century and have been saved from extinction only through the efforts of conservationists. Some 100 species of snakes, including the poisonous copperhead, cottonmouth, rattlesnake, and Texas coral snake, are native to the state. The alligator is found in the lower reaches of all the major rivers and bayous.

The people. Texas has long been a huge reservoir for diverse streams of races and cultures. For the bands of prehistoric hunters, for the waves of Indian tribes, for the Spanish and Mexicans pushing northward, for the Anglo-Americans from the North and East, and for colonizers who came to Texas directly from Europe, there was more than enough room for settlement and for the opportunity to influence the institutions of the state. Some churches still conduct services in Swedish, Czech, or Spanish; throughout the south and west, Spanish remains the family language of many people.

During the 19th century there were streams of migration into Texas. Between 1821 and 1836 an estimated 38,000 settlers, on promises of 4,000 acres (1,620 hectares) per family for small fees, trekked from the United States into the territory. In the 30 years before the Civil War, shiploads of Germans, Poles, Czechs, Swedes, Norwegians, and Irish arrived. Church-oriented, they took with them the Roman Catholic and Protestant faiths.

During the post-Civil War years numerous families moved from devastated Southern plantations to farms and ranches of the Southwest. From the north central states came communities of farming families with Swedish, Polish, and Irish backgrounds seeking relief from the tight economy. Others came from Europe, including Belgians, Danes, Italians, and Greeks, to become city dwellers, craftsmen, and keepers of small shops. Since the 1960s the Asian population has grown rapidly.

About 50,000 Indians live in Texas, but this figure fails to account for the many families who have some Indian ancestry. Most of the present-day Indians are city dwellers, but three tribes remain cohesive units. The Alabama-Coushatta Indians occupy one of the two reservations in

the state, in East Texas. The Tigua live on a reservation in El Paso, and the Kickapoo live near Eagle Pass.

More than one-fifth of all Texans are of Hispanic descent, and their number continues to grow. Many of the communities along the U.S. side of the southwestern border are almost totally Hispanic, and larger cities such as Brownsville, Laredo, Corpus Christi, El Paso, and San Antonio carry the mark of Spain and Mexico in their architecture, names, and language. With the urbanization of the state and the decrease in the demand for agricultural workers, large Hispanic populations have converged on the major metropolitan centres that lie farther from the border.

The Civil War brought freedom for thousands of black slaves within the state. In the 20th century the black population clustered in the central parts of the larger cities, and more than 40 percent of blacks are now concentrated in the urban areas of Dallas and Houston.

The economy. Cotton, cattle, and oil—all based on land resources—dominated the successive stages in Texas' economic development until the mid-20th century, and they have continued to undergird the state's basic wealth. Retailing and wholesaling, banking and insurance, and construction have been among the activities reflecting the general affluence, urbanization, and diversification of the state's economy. Despite the growth of manufacturing and other industries, however, the Texas economy has remained heavily dependent on oil and gas. Fluctuations in oil prices—such as those occurring in the 1980s—have directly affected the economy, with the result that the classic Texas "boom and bust" economic cycle has continued.

Numerous national corporate headquarters have moved to Texas, and petroleum companies have explored for new sources of energy to continue their leadership in providing fuel for the nation. The Lyndon B. Johnson Space Center, an installation of the National Aeronautics and Space Administration (NASA), is located in Houston and is among many federal air installations in Texas. In addition, tourism has become a major business, and Dallas has attracted attention as a fashion centre—generally a low-wage industry, however, for most employees. Texas also has become preeminent in its oceanographic investigations into uses of the continental shelf and in the areas of medicine and surgery.

Agriculture. The fertile lands of East Texas attracted cotton farmers before the Civil War, and, following that struggle, cotton became the state's major crop. As mechanized farming developed, cotton production shifted to the High Plains country of West Texas, where irrigation and fertilizer fostered bountiful crops and maintained Texas' national leadership in cotton production. Occasional crop failures due to drought led to crop diversification. In total value of farm crops, Texas consistently has ranked in the top five among the states since the mid-20th century and has been a leading producer of grain sorghums, peanuts (groundnuts), and rice.

Nearly all of the mohair that is produced in the United States comes from the Angora goats of Texas. The state leads all others in the raising of beef cattle and sheep. The vast cattle empires of the 19th century have tended to shift to coastal areas during the 20th century, reversing the path of cotton.

Mining. New uses for oil were being developed when in 1901 the Spindletop gusher blew in near Beaumont. Texas leads all other states in oil and natural gas production. It also ranks first in oil-refining capacity. Oil deposits have been found under more than two-thirds of the state's area, though many finds seem too small for commercial development. Texas also leads all other states in the production of sulfur, crude gypsum, and magnesium.

Industry. Manufacturing began originally with the processing of local raw materials: cotton gins and cottonseed mills, meat-packing plants, flour mills, and fruit- and vegetable-canning plants. The production of electric and electronic equipment is now the largest manufacturing employer, followed closely by nonelectric machinery.

Oil refining is a major processor of raw materials, and oil-field equipment is manufactured. The Gulf Coast area is the centre for the petrochemical industrial complexes. A large percentage of the basic petrochemicals that are produced in the United States come from plants located from Beaumont to Corpus Christi. Development in aerospace, military, and health industries has led to some economic diversification in this area.

Reflecting a maturing economy, manufacturing has moved toward the fabrication of finished consumer products. The growth of the electronics industry has been outstanding, and other finished goods manufactured in quantity include air conditioners, furniture, boats, household appliances, machinery, leather goods, and clothing.

Transportation. The vastness of Texas and its contrasts in terrain originally posed great difficulties for transportation yet greatly stimulated its development. The desire to develop inland areas was one factor leading to the establishment of Austin as the capital. In 1852 the legislature granted public lands to railroads for each mile of track constructed, and in 1883 it authorized a county road tax for farm-to-market dirt roads. By 1900 railroads crisscrossed the state, and dirt roads straggled between most communities.

Today Texas leads the nation in road and rail mileage. It has a well-developed federal and state highway system, although concentrated in the more heavily populated east; this system is supplemented by an extensive network of roads maintained by counties and cities. As in other states, the actual mileage of mainline railroads has diminished, and passenger transportation has been discontinued over most lines. Operating freight revenues, however, have increased tremendously since the mid-20th century.

Texas was a pioneer in the development of the airplane. In or near San Antonio were located the first army flying schools, established at Fort Sam Houston in 1910; Kelly Field, which became a training camp for pilots in 1917; and Randolph Field, which by 1931 was serving as "the West Point of the Air." The need for air power in World War II brought air training to more than 40 military bases in Texas. Dallas–Fort Worth, Houston, and San Antonio are focal points for civilian air transportation. The Dallas–Fort Worth Regional Airport is the nation's largest in terms of land area and one of the busiest. The Houston Intercontinental Airport, one of two airports serving Houston, encompasses 7,300 acres and provides a computer-run train to carry passengers between terminals.

The discovery of oil and gas necessitated cheaper routes of water transportation to markets in the East and North. Federal aid permitted harbour improvements at Galveston, Sabine Pass (opening water routes to Port Arthur and Beaumont), Aransas Pass, and Corpus Christi. The opening of the 44-mile Houston Ship Channel has made Houston a major international port. In the 1930s an intercoastal canal was completed from New Orleans to Sabine Pass and from Galveston to Corpus Christi, and in 1946 the Gulf Intracoastal Canal was opened from Brownsville to Florida. Continuous dredging operations have opened lanes of ocean commerce to many smaller ports. Galveston, oldest among the major ports, is the headquarters for extensive commercial fishing enterprises. (Water transportation)

Administration and social conditions. *Government.* The constitution of 1876 outlines the prevailing structure of Texas government. The governor, elected for a four-year term, may initiate legislation, call special legislative sessions, veto bills, and appoint boards and commissions. The governor's power is limited, however, because numerous officials and executive boards are elected rather than appointed. The bicameral legislature comprises the Senate of 31 members who serve for four years and the House of Representatives, with 150 members elected for two years. The top court for civil matters is the Supreme Court, with a chief justice and eight associate justices elected for six-year terms. The highest court for criminal matters is the Court of Criminal Appeals, with nine justices elected for six-year terms. There are 14 courts of civil appeal and more than 370 state district courts, with judges elected for four-year terms. Lower courts comprise county courts, justice of the peace courts, and municipal courts.

Texas comprises 254 counties; the largest of them, Brewster, with some 6,200 square miles, is roughly equal to the combined areas of Connecticut and Rhode Island. Within

(Marginal notes: Hispanic population; Mineral wealth; Water transportation)

constitutional limitations the legislature may create new counties. Each county is administered by a commissioners' court, which is an administrative rather than a trial body. Cities with a population of more than 5,000 may adopt their own home-rule charters.

The more critical problems of local government inevitably involve finances. The traditional source of local financing has been the property tax, but the movement of workers to suburbs and a hodgepodge of governmental agencies with taxing power has complicated the matter.

The Democratic Party has dominated elections since the Reconstruction period, pitting the many splinters of the party against one another in primaries that usually determine the eventual winners of state offices. Within the party the political philosophies of candidates have ranged from extreme liberalism to extreme conservatism. Certain contrary trends have emerged, however. The influx of new businesses and industries has brought many Republicans Emergence into Texas. The conviction that a two-party system would of two- allow elections based on issues rather than personalities led party some Democrats into the Republican camp, and strong political support of civil rights by the national Democratic Party life caused widespread defections by conservative Democrats. In addition, many influential Texas liberals have begun subtly to support Republicans, whom they consider more liberal than the old-time Democratic leaders.

Politics also has become more organized. Both Hispanics and blacks have used the power of the ballot to elect city officials, to influence state decisions, and to move upward in the power structure.

Education. Efforts to meet, understand, and solve educational problems arising from the social, economic, and other changes since World War II have brought mixed results. Some schools have library self-study in buildings designed to accommodate innovation and to place the educational emphasis upon individual growth rather than grade classification. Conversely, there are also formal classrooms in which Hispanic children are forbidden to speak in their family language and where traditional instructional methods are used. In general, local school systems, despite minimum standards established by the state, vary greatly in accordance with local financial resources, prevailing adult educational levels, and demands for equal education for all segments of the population.

Public lands have been used to support education from the years of the Republic of Texas. The Texas Congress in 1839 set aside lands in each county to support schools. The state constitution of 1876 affirmed the endowment of 52,000,000 acres for public schools and another 2,000,000 acres for a state university and agricultural college.

The University of Texas system enrolls more than 100,-000 students, nearly half of them on the main campus in Austin. The state has some 140 colleges and universities, including public senior institutions and junior colleges. The University of Texas and Texas A&M University have outstanding graduate and research programs. Rice University, a private institution in Houston, long has been recognized for its high academic standards.

Texas has a number of private or church-supported colleges and universities. Baylor University, in Waco, founded in 1845, is the only remaining university of the five established during the republic. Southern Methodist University, in Dallas, is a private institution affiliated with the United Methodist church.

Health and welfare. Programs for the mentally ill and mentally retarded have been slow to develop in Texas, but public concern has made itself felt in the legislature. There are several mental health hospitals within the state. For aged patients there are geriatric centres, and there is also a neuropsychiatric institute. Increasing attention has been given to outpatient clinic services. Several state centres care for the mentally retarded.

In medical education, research, and preventive medicine the state ranks among the nation's leaders. The University of Texas Health Science Center at Dallas and the Texas Medical Center, in Houston, are typical of these excellent programs.

Cultural life. The sense of the past has traditionally been strong in born-and-bred Texans. The emphasis long was based upon the heroics of living in a frontier land, upon individuals and their deeds, but an increasing appre- Apprecia-ciation of the diverse cultures that have enriched the life tion of of Texas has helped to preserve and strengthen those cus- cultural toms. Throughout the state regional historical associations diversity quietly search out and help to restore striking examples of 19th-century homes. San Antonio has re-created the early 18th-century Mexican-Spanish flavour in both restoration and in public shopping and walking areas in the heart of the city. Fredericksburg, with its German background, preserves many 19th-century customs and continues to cling to German as a family tongue. Even a metropolitan city like Houston has found space adjacent to its downtown area for restored historic homes. Laredo vividly dramatizes the marriage of Mexican and Anglo cultures with an annual Washington's Birthday parade and fete. Particularly evident are influences from Mexican culture, from the deep-rooted impact of the cattle country, and from the newer yet vibrant life fashioned by oil booms, wildcatting, refineries, and pipelines.

Art, music, and literature occupy significant places in the lives of many communities in Texas. The Amon Carter Museum of Western Art in Fort Worth houses many paintings and bronzes of Western artists and maintains a microfilm collection of Western newspapers published before 1900. With the Fort Worth Art Museum, the William Edrington Scott Theatre, the Kimbell Art Museum, and the Fort Worth Children's Theater, the Amon Carter Museum provides a cultural centre for study and appreciation of the arts.

Houston's Civic Center nestles in 150 acres amid the city's tall downtown buildings. It serves as the home for the Houston Symphony Orchestra and the Houston Grand Opera. The world-famous Alley Theater is located nearby. In Dallas the Margo Jones Theatre and the Dallas Theater Center provide outlets for cultural and educational groups. The Dallas Symphony Orchestra is among the better known classical ensembles in the nation. Cultural interests, however, are not restricted to large metropolitan areas. Odessa, for example, supports the unique Presidential Museum, showing extensive memorabilia of the U.S. presidents, as well as an accurate replica of London's Globe Theatre, in which a summer program of Shakespearean and other Elizabethan plays is produced. Colleges and universities in the state are active in all areas of the arts.

Water has added new dimensions to popular recreation. In 1913 there were only eight major lakes or reservoirs in Texas, but today there are more than 180, many built to store water against periodic droughts. Several national parks and forests and more than 100 state parks dot the Sports state, many of them providing fishing, swimming, camp- and ing, and picnicking facilities. Sports fishing has developed amuse-into a major recreation along the Gulf Coast. ments

Other entertainment centres include Six Flags over Texas, a westernized amusement park between Dallas and Fort Worth, and, near the Dallas suburb of Mesquite, a reservation into which motorists can drive and watch apparently free-roaming elephants, giraffes, and other African wildlife. Sea World of Texas is an aquatic theme park in San Antonio. In Houston the well-publicized Astrodome has become a centre of professional sports, rodeos, bullfights (with no killing), circuses, and other spectaculars.

Book publishing, though not a big business within the state, has gained a strong foothold. The University of Texas Press and the Texas A&M University Press have gained national acclaim through their scholarly and historical works, and the Southern Methodist University Press likewise has established discriminating standards. Several commercial publishing companies concentrate on books and monographs related to the history of the Southwest.

University libraries, art galleries, and special collections contain remarkable treasures. The Armstrong Browning Library at Baylor University houses more than 10,000 books and manuscripts by and about Robert Browning and Elizabeth Barrett Browning. At the University of Texas in Austin, the Lyndon Baines Johnson Presidential Library, operated as a branch of the Library of Congress, houses millions of documents on public affairs since the mid-1930s related to Johnson's public career. Also at the

university are a Latin-American collection, the Michener Collection of Art, and other special collections.

HISTORY

The forerunners of the West Texas Indians lived in camps that were made perhaps as much as 37,000 years ago. Possessing only crude spears and flint-pointed darts, these hunters survived primarily on wild game. In the more fertile areas of East Texas, some of the tribes established permanent villages and well-managed farms and evolved political and religious systems. Forming a loose federation in order to preserve peace and to provide for mutual protection, they came to be known as the Caddo confederacies. By 1528, when the first Europeans entered the interior of Texas, the area was sparsely settled, but the culture and habitation of the Indians exerted measurable influence on the later history of the region.

Settlement. By the 1730s the Spanish had sent more than 30 expeditions into Texas. San Antonio, which by 1718 housed a military post and a mission, had become the administrative centre. Missions, with military support, were established in Nacogdoches in East Texas, Goliad in the south, and near El Paso in the far west. The French also explored Texas. The explorations of Robert Cavelier, Lord de La Salle, and his colony at Matagorda Bay were the bases of French claims to East Texas.

Anglo-American colonization gained impetus when the United States purchased the Louisiana Territory from France in 1803 and claimed title to lands as far west as the Rio Grande. By 1819, however, the United States had accepted the Sabine River as the western boundary of the Louisiana Territory. Moses Austin secured permission from the Spanish government to colonize 300 families on a grant of 200,000 acres. When Mexico became an independent country in 1821, his son, Stephen F. Austin, received Mexican approval of the grant. He led his first band of settlers to the area along the lower Brazos and Colorado rivers. By 1832 Austin's several colonies had about 8,000 inhabitants. Other colonies brought the territory's Anglo-American population to about 20,000.

Revolution and the republic. Unrest throughout Mexico, including Texas, resulted in a coup by Antonio López de Santa Anna, who assumed the presidency in 1833. Texans, hopeful for relief from restrictive governmental measures, supported Santa Anna. Austin expected a friendly hearing about these grievances but instead was imprisoned in Mexico City for encouraging insurrection. He was freed in 1835 and returned home to find that skirmishes had already developed between the colonists and Mexican troops and that Santa Anna was preparing to send reinforcements. Texans formed a provisional government in 1835, and in 1836 issued a declaration of independence at Washington-on-the-Brazos. David G. Burnet was chosen ad interim president of the new Republic of Texas, Sam Houston was appointed its military commander, and Austin became commissioner to the United States with the mission of securing strategic aid and enlisting volunteers.

The famous siege of the Alamo in San Antonio lasted from February 23 to March 6, 1836. The strategic objective of the stand was to delay Mexican forces and thereby permit military organization of the Texas settlers. As the battle climaxed with a massive attack over the walls, the defenders (about 183) were all killed. Among the dead were the famous frontiersmen Jim Bowie and Davy Crockett. On April 21 Sam Houston led a surprise attack on the Mexican troops at the San Jacinto River, where he succeeded in capturing Santa Anna and in securing victory for the Texans.

The Texan revolution was not simply a fight between the Anglo-American settlers and Mexican troops; it was a revolution of the people who were living in Texas against what many of them regarded as tyrannical rule from a distant source. Many of the leaders in the revolution and many of the armed settlers who took part were Mexicans.

The Republic of Texas was officially established with Sam Houston as president and Stephen Austin as secretary of state. Cities were named in their honour: Houston was the capital until 1839, when Austin was approved as the permanent capital.

The republic had a difficult 10-year life. Financing proved critical, and efforts to secure loans from foreign countries were unsuccessful. Protection against raids from Mexico and occasional attacks by Indians required a mobile armed force. During the republic a squad of armed men, the famous Texas Rangers, was maintained to ride long distances quickly to repel or punish raiding forces.

Annexation and statehood. As early as 1836, Texans had voted for annexation by the United States, but the proposition was rejected by the Jackson and Van Buren administrations. Great Britain favoured continued independence for Texas in order to block further westward expansion of the United States, but this attitude only helped to swing Americans toward annexation. Annexation was approved by the Texas and the U.S. congresses in 1845, and the transfer of authority from the republic to the state of Texas took place in 1846. One unique feature of the annexation agreements was a provision permitting Texas to retain title to its public lands.

The U.S. annexation of Texas and dispute over the area between the Rio Grande and the Nueces River brought about the Mexican War. Troops led by Winfield Scott and Zachary Taylor invaded Mexico, and Scott captured Mexico City on Sept. 14, 1847. In the Treaty of Guadalupe Hildago, signed on Feb. 2, 1848, Mexico gave up its claim to Texas and also ceded an area now in the states of New Mexico, Utah, Nevada, Arizona, California, and western Colorado. Texas claimed most of this additional area but later relinquished it in the Compromise of 1850.

Texas seceded from the Union on Jan. 28, 1861. The American Civil War brought disruption to the state. Governor Sam Houston strongly opposed secession, and, after refusing to take the oath of allegiance to the Confederacy, he was removed from office. During the war Texans had to defend themselves from Indian attacks, from Mexican encroachments, and from Federal gunboats and invading soldiers. Federal forces ultimately gained control of the lower Gulf Coast but were unable to move far inland.

The modern period. During the last three decades of the 19th century there were rapid developments in the population and economy of Texas. The state was readmitted to the Union under a new constitution in 1869. By 1875 the Comanche had been forced onto a reservation in present-day Oklahoma. Under waves of immigration, towns were established, farming spread throughout the central areas of the state, and the cattle industry began to thrive on the plains of West Texas. Railroad building and increased shipping fashioned new links with the rest of the world. Manufacturing, encouraged by the Civil War years, continued to grow. By 1900 the population had grown to more than 3,000,000.

The Lucas gusher that blew in at Spindletop (Beaumont) in 1901 opened a new economic era for the state. Oil companies were formed, oilmen began to search for and find new deposits in the state, and refining and marketing activities provided new jobs and incomes for Texas. Like the rest of the nation, Texas suffered throughout the Great Depression of the 1930s but later benefited from the tremendous industrial expansion that took place during World War II.

Economic and population growth continued in the postwar era. Oil refining, chemicals, and petrochemicals continued to dominate, but electronics, aerospace components, and other high-technology items became increasingly important in the last quarter of the 20th century. The population of Texas increased fourfold between 1900 and 1980, and by 1980 one-third of all Texans were either black or Hispanic.

Since the mid-20th century, Texans have played an increasingly important role in national politics. Sam Rayburn, of Bonham, served as speaker of the U.S. House of Representatives for 17 years, a tenure longer than that of any other person. Lyndon B. Johnson, who earlier had served as a Texas congressman, was majority leader of the U.S. Senate in the late 1950s, vice president of the United States from 1961 to 1963, and president from 1963 to 1969. In 1988 George Bush of Houston, who served as vice president of the United States from 1981 to 1989, was elected president. (DeW.C.R./R.A.Wo.)

THE MOUNTAIN REGION

Colorado

Colorado is classified as one of the Mountain states of the United States, although only about one-half of its approximately 104,091 square miles (269,596 square kilometres) lies in the Rocky Mountains. It borders Wyoming and Nebraska on the north, Nebraska and Kansas on the east, Oklahoma and New Mexico on the south, and Utah on the west. Colorado was admitted to the Union on Aug. 1, 1876, as the 38th state. The capital is Denver.

Colorado's history is written in the names of its cities, towns, mountain ranges, and passes. Indian and Spanish names alternate with those of frontier Americans, and many ghost towns are reminders of the thousands of prospectors and homesteaders who streamed into the territory in the mid-19th century to pursue dreams of gold and grain bonanzas. The vast cattle ranges and agricultural acreage fed by huge irrigation projects are characteristic of modern Colorado, as are the diversified industries and the educational and research facilities in its urban centres.

PHYSICAL AND HUMAN GEOGRAPHY

The land. *Relief.* Colorado's natural landscape ranges from the flat, grass-covered High Plains of the Great Plains, through the rolling, hilly Colorado Piedmont paralleling the Rocky Mountain front, to the high and numerous mountain ranges and plateaus that make up the southern Rocky Mountains and the Colorado Plateau. Within these areas the state rises from about 3,500 feet (1,100 metres) in the east to more than 14,000 feet in the Rockies.

Lack of water is the dominant characteristic of Colorado's eastern plains region. The Arkansas and South Platte are the major rivers, but both rise in the mountains to the west. Many other rivers are dry during much of the year, and the land is flat. Underlain by layered rocks, sandstones, shales, and limestones covered by a short grass vegetation, the natural environment is inhabited by prairie dogs, jackrabbits, coyotes, rattlesnakes, antelope, and such birds as the meadowlark and lark bunting. The climate, flatness, and layered rocks have produced fertile soils that lack only moisture. Nearly all of the plains are covered by brown soils, which support a strong mat of buffalo and grama grass, a valued resource for cattle grazing.

About 50 miles (80 kilometres) wide and 275 miles long, the Colorado Piedmont is a picturesque, hilly to mountainous landscape sandwiched between the plains and the mountains. It encompasses all of the state's large urban complexes, the major transport arteries, most of the industry, most of the major colleges and universities, and four-fifths of the people. The layered rocks have been uptilted and dissected into prominent stream divides and deep valleys by the major rivers and numerous smaller streams that debouch onto the piedmont from the mountains. Terrain, ground cover, and climatic conditions provide suitable habitats for rabbits, waterfowl, pheasants, coyotes, deer, raccoon, and, on the arid foothills and unirrigated uplands, rattlesnakes. Many species of birds prevail, of which the meadowlark, crow, dove, and western magpie are most numerous. The climate and land of the Colorado Piedmont attract tourists, homeseekers, and farmers. The major cities and the wealthy farm areas lie where the streams have broadened the valleys. Among the attractive features of the landscape is the high, grotesque, and multicoloured agglomeration of sandstones northwest of Colorado Springs known as the Garden of the Gods. In the foothills southwest of Denver is one of the world's largest and most beautiful outdoor amphitheatres, Red Rocks Park. Since 1880, more than 400 reservoirs have been built in the piedmont to store water for irrigation. These sites are meccas for water sports, hunting, and house building.

The western half of Colorado includes the huge mountain upthrust, comprising much of the southern Rocky Mountains and the Colorado Plateau, where mesas and mountain ranges alternate with broad, intervening valleys

(margin: The High Plains)

(margin: The mountainous west)

and deep, narrow canyons. With its copious amount of precipitation, this mountain land provides water for six states and Mexico. The drainage pattern from the Rockies is oriented by the mountains themselves, which form the Continental Divide, the main watershed boundary of the continent.

The mountainous portion of Colorado comprises a great number of individual mountain ranges. In the north and northwest the Front, Medicine Bow, Park, and Rabbit Ears ranges are major uplifts, and Rocky Mountain National Park (established 1915) is a major attraction. The western and southwestern extremity of the state comprises the tilted and acutely uplifted layered rock of the Colorado Plateau. The Grand Mesa and the White River Plateau, both above 10,000 feet, are major attractions. The region contains several national monuments and parks, most of them primarily scenic, while Mesa Verde National Park, designated by UNESCO as a world heritage site, preserves the remnants of cliff-dwelling Indian settlements.

The San Juan Mountains, a large, heavily ice-dissected volcanic plateau above 13,000 feet, rise in the southwest. The Sangre de Cristo Range is a linear range in the south central region of the state. At its western base are some of the largest sand dunes in the interior of the North American continent, an area of 60 square miles set aside in 1932 as the Great Sand Dunes National Monument.

The Sawatch, Colorado's highest range and the central core of the Colorado Rockies, consists of Mount Elbert—at 14,433 feet (4,399 metres) the highest point in the state—and many other elevations above 14,000 feet. The Colorado Rockies contain a significant share of the U.S. public domain in the form of 11 national forests, which total about 14,000,000 acres (5,670,000 hectares) of land. (Another national forest lies partly in the state.) There are 53 peaks more than 14,000 feet in elevation and 831 peaks between 11,000 and 14,000 feet.

Climate. Colorado may be divided into three climatic regions that largely reflect differences in elevation and proximity to the major mountain ranges: the eastern plains, the piedmont, and the mountains and high plateaus of the west. Summer temperatures on the plains average 75° F (24° C) for July and August, with extremes above 100° F (38° C). In the summer daily minimum and maximum temperatures may vary as much as 40° to 50° F (22° to 28° C), although the general variation is about 25° F (14° C). Winters are dry, cold, windy, and generally harsh. The plains form a playground for the wind, and, though snowfall is light, the winter blizzard becomes a dread element for both people and animals. Average January nighttime low temperatures range from 10° to 30° F (−12° to −1° C), with daily highs from 36° to 50° F (−2° to 10° C). Annual precipitation is erratic, ranging from 15 to 20 inches (380 to 510 millimetres). Approximately 70 percent of it falls during summer, and hail is frequent.

There is less precipitation annually in the Colorado Piedmont than on the plains, though about 70 percent of it falls in summer also, mostly in thunderstorms. July temperatures in Denver, the state capital, average 73° F (23° C); and January temperatures, 30° F (−1° C). Short hot and cold spells of above 90° F (32° C) and below 10° F (−12° C) are not uncommon. The chinook wind—a dry, descending winter airstream from the high mountains that is warmed by compression as it descends—often raises temperatures 30° to 40° F (17° to 22° C) in less than an hour, melts the snow cover, and can produce violent winds that have been recorded in excess of 100 miles per hour.

The rugged topography of the mountains and plateaus of western Colorado produces a complex pattern of local climates. Elevation, amount of exposure to the direct rays of the sun, and the orientation of mountain ranges and valleys to the general air circulation are major factors determining the climate of a particular location. Typically, wide variations in climate occur within short distances. July temperatures average about 60° F (16° C) at many mountain locations, while the lower plateaus and valley

(margin: Climate of the plains)

bottoms average some 20° F (11° C) higher. Winter temperatures often are more extreme with elevation. Leadville, at 10,000 feet, has an average January temperature of 17° F (−8° C), but temperatures can drop to −50° F (−46° C) at higher elevations. Arid conditions prevail over much of the Colorado Plateau, while at elevations above 5,500 feet (1,700 metres) rainfall and snow are sufficient to support thick forests. Precipitation generally increases rapidly with elevation, with amounts ranging from about 20 to 50 inches. Snow may fall during any month in the mountains, and total annual accumulations are heavy, regularly reaching 300 inches at some stations.

Plant and animal life. There are four broad ecological zones from the plains to the high mountain peaks. The plains are dominated by short-grass prairie, or steppe. In the foothills zone, from 5,500 to 7,000 feet, oak, mountain mahogany, juniper, and piñon pine are the dominant vegetation. Higher zones, from 7,000 to about 11,500 feet, feature a coniferous forest in which the ponderosa pine, Douglas fir, and blue and Engelmann spruce are dominant, interspersed with aspen and other deciduous, broadleaved species. The alpine tundra zone, above 11,500 feet, has sparse vegetation, mainly mosses, lichens, and sedges.

Most animal species have no permanent habitat in the Colorado Rockies. They move to high elevations where food and cover are plentiful during summer and return to the warmer lower elevations during winter. Deer, elk, and mountain sheep are the most common game animals. Among the furbearers, the coyote, wildcat, badger, marten, muskrat, and beaver are prevalent.

Settlement patterns. An overall consideration of Colorado's population is most meaningful in a regional context.

The demography of Colorado's eastern plains is much affected by the region's rigorous physical geography: its dryness, bareness, wind, and capricious precipitation. The seven plains counties constitute nearly one-sixth of Colorado's land area but have a dwindling population, the density of which rarely exceeds five persons per square mile (two per square kilometre). The towns of the plains, all located on highways and railroads, serve vast rural hinterlands where livestock raising is important and where wheat and sorghum are major products. Limon, Burlington, Cheyenne Wells, and Yuma are the largest towns.

Ready availability of water, a climate conducive to outdoor work and recreation, and proximity to the mountain front are mainly responsible for the large population growth of the Colorado Piedmont. The 22 counties occupy a third of the land area, and about 80 percent of the state's people live in the metropolitan areas of Denver–Boulder, Colorado Springs, Pueblo, Fort Collins, and Greeley.

Terrain, isolation, severe winters, and separation from the piedmont counties by the Continental Divide are major limiting factors in population density and distribution in Colorado's mountain and plateau counties. The 34 counties occupy half of the state's land area, but some have fewer than two people per square mile. Unlike the plains, however, the population is increasing. The rural population is settled mainly in restricted mountain valleys, where ranching and irrigation farming support the family unit. Ski resorts enhance the local economies of such areas as Aspen and Vail, while energy production is important to the economy of Grand Junction.

The people. The first Colorado territorial census, in 1860, showed a population of 34,277, 86 percent of it rural. This pattern continued until 1910, when half of the nearly 800,000 inhabitants were urban. After 1950 the urban percentage rose sharply, reaching more than 80 percent of the population in the late 20th century. The number of blacks and American Indians is small, but a significant percentage of Coloradans are of predominantly Mexican descent. American Indians are concentrated in two areas of the state: metropolitan Denver, with migrants from tribes throughout the United States, and the southwestern corner of Colorado, where two Ute reservations are all that remain of that tribe's once-vast presence in the area. As in most of the nation, minority groups are hampered by inadequacies in education, housing, and economic opportunity. The conditions of seasonal migratory

labour have been of increasing concern at all levels of government.

The economy. Location, soil, minerals, water, space for expansion, and physical beauty are positive resources in Colorado's growth. Among the Rocky Mountain states Colorado accounts for nearly two-fifths of the population but about one-half of all manufacturing employment.

Agriculture. From the outset, agriculture has been basic to Colorado's economy. Colorado was the first state to abrogate the riparian doctrine of water use, based on English common law, which gave prior water rights to owners of adjoining lands. It evolved instead a totally new concept for use of water resources based on the rights of the larger public, which has been adopted and adapted by most of the 17 Western states. The state ranks high among the U.S. states in the amount of land under irrigation. Corn (maize), wheat, and hay are the major crops.

Colorado is a major cattle producer and also raises large numbers of hogs and sheep. Weld, Morgan, Larimer, and Boulder counties are the national centre for the production of cattle fattened in feedlots rather than on the open range. The piedmont landscape offers the spectacular sight of acres of fat cattle feeding on corn and alfalfa (lucerne) near Greeley. There is much corporate farming, and generally it is highly mechanized.

Mining. Although not the leader that it was in the mining bonanzas of a century ago, Colorado's mineral industry continues to make substantial contributions to the economy. Among the principal minerals are coal, petroleum, molybdenum, and sand and gravel. Northwestern Colorado has some of the largest and most valuable coal deposits in the United States, but the industry is relatively dormant because of decreasing demand. Petroleum and natural gas reserves are mostly in the form of oil shales.

The state's power resources are important. Power generation is based on coal, hydropower, petroleum, and natural gas. Consumption is immense, and demands are difficult to meet. About two-fifths of the total capacity and production is privately owned.

Industry. Major industries include printing and publishing, machinery production, food and food products, metal production, lumber and wood products, and military ordnance and accessories.

Tourism. Although manufacturing, agriculture, and summer tourism are the mainstays of Colorado's econ-

(marginal notes) Ecological zones

Cattle production

Lodge and (background) chair lifts and slopes at Vail, a ski resort in Eagle county, Colo.

Winter
sports

omy, winter sports have grown at an almost alarming rate. Transport, housing, and lift facilities are continually expanding to meet the annual ski invasion.

Transportation. Colorado has a well-developed transportation system and ranks first among the mountain states in road mileage. Main highways tend to be east–west, circumvent high mountain masses, and follow valleys and canyons to their heads in the 32 mountain passes over the Continental Divide. The highest of the passes, at 12,183 feet (3,713 metres), is on the seasonal Trail Ridge Road in Rocky Mountain National Park. A number of other passes exceed 10,000 feet in elevation. One of the nation's major east–west interstate highways runs through the state, utilizing twin vehicular tunnels under the Continental Divide west of Denver.

Denver's Stapleton International Airport is a major centre in the nation's air traffic pattern. It is served by several major airlines, and carriers also link Denver with other Colorado cities and with neighbouring states. Several large airfreight depots adjoin Stapleton Airport. Railroad lines in Colorado are mainly bulk-freight carriers using multilevel railcars and flatcars for containerized freight, although a main east–west Amtrak passenger route passes through Denver and the Rockies.

Administration and social conditions. *Government.* In 1875 a convention drew up the constitution for the prospective state, which was admitted to the Union the following year. Because Colorado's admission occurred 100 years after the signing of the Declaration of Independence, it became known as the Centennial State.

The executive branch has five offices: governor, lieutenant governor, secretary of state, attorney general, and treasurer. All elected officials serve four-year terms. Numerous commissions, boards, and examiners are appointed to discharge the executive functions of state government. At the county level the constitution provides for several kinds of officers.

The Colorado General Assembly, which meets annually, comprises a Senate of 35 members elected to four-year terms and a House of Representatives of 65 members elected to two-year terms. The Legislative Council, created by statute in 1953, is a 13-member fact-finding agency of the General Assembly, and the Joint Budget Committee, established in 1959, is the permanent agency for fiscal and budgetary review. Under the Administrative Organization Act of 1968, the Commission on Uniform State Laws was created; and the Commission on Interstate Cooperation dates from 1937.

Local governments in Colorado have a jurisdictional balance with the state government. Counties can opt for either a home rule charter or for a constitutional government with offices and powers outlined by the state legislature. Three of the counties (Denver, Pitkin, and Weld) have home rule charters. Constitutional local governments generally consist of the following officers (variations depending on population): commissioners, clerk, sheriff, coroner, treasurer, surveyor, assessor, and attorney. Most terms are for four years.

The Colorado judiciary comprises the seven-member state Supreme Court, district courts encompassing one or more counties, and the county courts. In addition, the constitution provides for juvenile and probate courts, as well as municipal courts, which provide the grass-roots core of the judicial system.

Political
balance

Since World War II each state political campaign has involved the issue of extension of federal activities, with Democrats generally committed to extension, and Republicans opposed. Since the 1920s each of the two parties has won control of the legislature in about one-half of the elections, indicating a fairly even balance within the state.

Education. The people of the Colorado Territory created the University of Colorado in 1861. The school did not open until 1877, but publicly supported primary education began in 1862, with secondary schools opening in the following decade. Population increases since the end of World War II have produced problems in funding, in instructional space, and in busing to achieve improved instructional programs. Curriculum and instructional revision has been undertaken in all areas, with foreign languages and mathematics particularly stressed.

In addition to the University of Colorado, at Boulder, the University of Denver (1864), the Colorado School of Mines, at Golden (1869), and Colorado State University, at Fort Collins (1870), were founded before statehood. Colorado has more than 40 colleges, junior colleges, and universities, of which about half are publicly supported. Of special note is the U.S. Air Force Academy, authorized by Congress in 1954. In 1958 it moved into its campus near Colorado Springs.

Colorado has three important observatories. The High Altitude Observatory in Climax and the Chamberlain Observatory in Denver are operated by the University of Denver. The National Center for Atmospheric Research is a cooperative project of more than 40 U.S. universities, sponsored by the National Science Foundation. It has ties also to the Department of Astrophysics and Atmospheric Physics of the University of Colorado.

Observatories

Health and welfare. Colorado's income per capita is higher than the national average, as is its expenditure on public assistance. There is considerable income disparity between the rural counties and the urban counties of the Front Range corridor. For example, Arapahoe's per capita income, the highest among the area's urban counties, is more than three times Conejos', the lowest among the area's rural counties. Provision of health, education, and other services is affected by this disparity, although the state government attempts to equalize services.

Cultural life. Red Rocks Park, a large natural amphitheatre in the foothills west of Denver, is Colorado's best known theatre; it hosts frequent musical events. The Central City Opera House, dating from 1878, has a summer season of opera and drama. Summer fare is available as well at Elitch Gardens Theatre, opened in Denver in 1891, and at festivals in Aspen and Boulder. The Denver Center for the Performing Arts was completed in the early 1980s. The Fine Arts Center in Colorado Springs is a regional art centre. The Denver Art Museum houses collections of Renaissance and Peruvian paintings as well as Oriental and pre-Columbian works.

Libraries have an important function in Colorado's cultural milieu. There has been a continuing trend to organize regional libraries to provide adequate service to every community. The Bibliographical Center for Research, Rocky Mountain region, is one of three such centres in the United States. The Colorado State Library is responsible for furnishing all Colorado institutions with research, reference, and general reading services.

The State Historical Society maintains nine historic properties. These include the Colorado State Museum in Denver, several houses and forts dating from the early days of the state, and the Ute Indian Museum in Montrose and the El Pueblo Museum in Pueblo. On the western and southwestern plateaus the Black Canyon of the Gunnison (established 1933), Colorado (1911), and Dinosaur (1915) national monuments are preserved as scenic attractions. Because of their cultural and historic value, Mesa Verde National Park (1906), Hovenweep (1923), and Yucca House (1919) national monuments in the southwest—all relics of former Indian civilizations—are preserved for public use and for archaeological study and exploration.

HISTORY

The earliest inhabitants. The influence of Indian culture on Colorado has been strong. Indian place-names have enriched the English vocabulary; Indian folktales, music, and dances have been assimilated into American culture; and Indian food and artwork have made valuable and unique contributions to the Colorado economy. The cliff dwellings in Mesa Verde National Park are among the physical remains of early Indian communities.

Indian
and
Spanish
heritages

The Plains Indians, mainly Arapaho and Cheyenne, guided the explorers, traders, and trappers across the plains. The Indians knew the streams, the natural routes, the sources of fresh water and firewood, the areas of natural protection, and the feeding grounds of the buffalo. The Great Basin Indians, mainly the Ute, made similar contributions to knowledge of the Rocky Mountains.

The Indians, however, were displaced by Spanish explor-

ers from Mexico in search of cities of gold and silver. Fearing attacks by the United States, they strengthened the Spanish frontier in the 1840s with huge land grants reaching as far north as the Arkansas River. On these grants were established the first permanent white settlements in Colorado and, in 1851, the first recorded irrigation. The Spanish language is imprinted on Colorado geography. The state was named from the Spanish *colorado* ("red," or "ruddy"). Twenty large streams in Colorado are called *rios,* and numerous cities, villages, and mountain ranges and peaks have Spanish names.

The U.S. territory. American exploration of Colorado began immediately after the purchase of the Louisiana territory by the United States in 1803. Dispatched to map, explore, and record scientific data about the new land were Zebulon Pike in 1806, Stephen Long in 1820, and John C. Frémont in 1842. As knowledge of the area spread, fur traders and trappers followed. Permanently stamped on the land are the names of such frontier scouts as Kit Carson and Jim Bridger. Fort Bent and Fort Saint Vrain served as collection points for furs, places for food and supplies, and shelter and protection from Indians.

In 1859 gold was discovered. A sudden great influx of people took place to the cry of "Pikes Peak or bust," and the bustling gold-dust towns of Central City, Black Hawk, Gold Hill, and Cripple Creek made mining history. The first gold was panned from the streambeds, after which came the search for the mother lode in the mountains.

In these frontier mining districts, civil and criminal codes were drawn up, and penalties for crimes were established. Of the thousands of seekers for gold, only a few found their bonanza. By the 1890s, the boom was over, and the mountains were largely vacated except for a few permanent mining towns.

Contemporaneous with the mining rushes was Colorado's period of territorial government. In 1861 congressional legislation provided for administrative officials to be appointed by the president. Seven governors were appointed in 15 years, and none served a full four-year term. In 1875 a constitution was drawn up and ratified by the territorial assembly, and in 1876 Colorado became a member of the Union.

Economic and social growth. Shortages of food during the gold rush led enterprising pioneers to initiate a new and significant component to the regional economy. Water was taken from the streams and put onto the land in what has been called the single most significant event in Colorado history. An entirely new social code and economy and a Western water law evolved. The industries and inhabitants of cities and towns came to depend upon irrigation agriculture. Sugar factories, which extracted the juice from the sugar beet, sprang up across the landscape.

By 1881 the buffalo herds on Colorado's plains had been replaced by cattle and sheep. From its mountain valleys, plains, and feedlots, Colorado became a major producer of meat. Automobiles, railroads, and a tunnel through the mountainous backbone united the mountains and high plateaus of western Colorado with the flat eastern portion of the state, and the flow of resources set the pace for industrial development. Also in the 1880s, steel was first produced in Pueblo, based on local deposits of iron ore and coal, and Pueblo became a major steel producer. Drought and the Great Depression of the 1930s triggered rural emigration but also spurred the construction of a large-scale transmountain water diversion project.

World War II and after. Fear of enemy attack on both U.S. coasts during World War II stimulated the development of government facilities in Colorado because of its interior, yet accessible, location. The Denver Federal Center, Rocky Mountain Arsenal, Camp (later Fort) Carson, Camp Hale, and other installations brought thousands of newcomers to the state. After the war many of these newcomers stayed on to develop ski resorts, the electronics industry, and the U.S. Air Force Academy. By the 1980s, some three-fifths of the state's population had been born outside of Colorado. Tourism replaced mining and agriculture as the mainstay of the economy, while official state policy promoted orderly growth of the economy and the infrastructure to support it.   (M.J.Lo./J.L.Di.)

The Colorado gold rush

Idaho

Idaho, admitted as the 43rd state of the Union on July 3, 1890, is one of the Mountain states, but it is often also classified as part of the Pacific Northwest region, a region unified by the Continental Divide as an eastern boundary and by the Columbia River drainage basin, which covers virtually the entire area. The name is an invented one, formerly thought to be an Indian name (Ee-dah-hoe) meaning "gem of the mountains."

With 83,564 square miles (216,432 square kilometres), including 1,153 square miles of inland water, Idaho has twice the combined area of the six New England states. Its boundaries are both historical and geographic in derivation. The boundary with the Canadian province of British Columbia on the north follows the 49th parallel of latitude, while the southern border with Utah and Nevada follows the 42nd parallel; both lines were established by treaty—the northern between the United States and Britain in 1846 and the southern between the United States and Spain in 1819. The state's northeastern border with Montana—in the Idaho panhandle—follows the Continental Divide, while the eastern border with Wyoming incorporates a small slice of Yellowstone National Park. On the west, Idaho's border with Oregon and Washington is a 480-mile (770-kilometre) straight stretch except between Weiser and Lewiston, where Hells Canyon of the Snake River serves as a natural boundary.

Idaho is shaped much like a logger's boot, thereby accidentally reflecting the state's rugged forest and mountain terrain in which logging and mining play major roles. The residents of Idaho enjoy some of the largest unspoiled natural areas in the United States, including about 2,500,000 acres (1,012,000 hectares) of wilderness and primitive land in which roads and vehicles are seldom to be found. Since its development in 1936 Sun Valley has become an internationally known area for winter sports. Idaho also has large supplies of groundwater. Hot springs are found in many parts of the state and are used to heat some homes and buildings in Boise, the capital, whose name (French *boisé,* "wooded") reflects its settlement as an oasis for explorers who once crossed the desolate Snake River Plains. A frontier character is still evident in the individualism of voting that makes the crossing of party lines, especially to support liberal issues and candidates, a frequent occurrence in an otherwise fairly conservative climate.

PHYSICAL AND HUMAN GEOGRAPHY

The land. Diversity of the natural environment is characteristic of Idaho's landscape, creating a sectionalism that is reflected in its community life, politics, economy, and cultural development, as well as in the varieties of its soils and animal and plant life. Altitude is often a more important factor in controlling Idaho's climate than is latitude. The northern areas of the state are lower in elevation on the average than are much of the central and southern areas. Prevailing westerly winds from the Pacific Ocean blanket most of the state, especially the northern and southwestern regions. A drier, colder, continental climate is more noticeable in the southeastern counties, but Idaho has a milder climate than most of the states located in the same latitudes east of the Continental Divide.

Relief and drainage. Parts of four major physiographic provinces are included within Idaho: the Northern Rocky Mountains, the Middle Rocky Mountains, the Columbia Basin, and the Basin and Range. The Northern Rockies extend from the Canadian border to south central Idaho and occupy nearly half the state's area. Peaks of between 10,000 and 12,000 feet (3,000 and 3,700 metres) are common in central Idaho, and in the Lost River Range, Mount Borah at 12,662 feet (3,859 metres) is the state's highest peak. Other notable ranges in this part of the state include the Sawtooth, Pioneer, Continental Divide, Beaverhead, and Bitterroot. Peak elevations generally decrease northward to about 6,000 feet at the Canadian border.

The Middle Rocky Mountains occupy a narrow strip along the Idaho–Wyoming border. The area comprises several ranges that trend north–south and northwest–southeast and rise to between 7,000 and 10,000 feet.

Margin notes (right column):
Geographic and historical borders

Mountain ranges and rivers

Grass- and sagebrush-covered plateaus and valleys and a few small lakes are found between the ranges.

The Basin and Range Province extends into southeastern Idaho as a roughly triangular-shaped desert with its base along the Idaho–Utah border. A series of low north–south-trending block-faulted ranges separate small gravel-floored basins.

The remaining part of the state is included within the Columbia Basin, which in Idaho is occupied entirely by the Snake River plateau. The Snake River follows the plateau in a broad crescent across southern and western Idaho; next to the Northern Rocky Mountains, it is the major natural feature of the state. It rises in the southeastern part of the state, with tributaries in Yellowstone National Park, and flows from east to west through "sagebrush Idaho." With huge reclamation projects, the river valley contains most of Idaho's irrigated farmland. The course of the Snake includes Hells Canyon—at 7,900 feet (2,400 metres) North America's deepest gorge—and 212-foot-high Shoshone Falls. Its valley is a geologically complex sequence of lakes, lava beds, mesas, buttes, canyons, and desertscape, symbolized by the barren craters and cones of the Craters of the Moon National Monument.

Idaho has some 2,000 lakes, and water is the state's greatest single resource. A major portion of its industry, agriculture, and population lies along the Snake, which furnishes water in abundance for one of the nation's largest irrigated areas and developed hydroelectric power sources.

Climate. Idaho's mountainous topography produces an extremely diverse climate pattern. In general, as altitude increases precipitation increases and mean temperatures drop. On a different scale, the high mountains in eastern Idaho tend to hold back the cold winter air that predominates in Montana and Wyoming, giving the state higher mean temperatures than are found at the same latitude and altitude in those states and in more midcontinental locations. Mean January temperatures range from 17° F (−8° C) at Deadwood Dam in the central mountains to 31° F (−1° C) at Orofino in the central panhandle. July temperatures range from 60° F (16° C) at Deadwood Dam to 77° F (25° C) at Grand View in the southwest.

Idaho is situated in the rain shadow of mountains to the west in Washington and Oregon, and only higher elevations receive adequate amounts of rainfall. Most of the Snake River plateau receives less than 10 inches (250 millimetres) of precipitation annually, making it the driest part of the state. At the other extreme, large sections of the Northern Rockies record annual totals of more than 50 inches of precipitation, much of it in the form of snow.

Animal and plant life. Idaho is home to numerous bird, mammal, fish, amphibian, and reptile species. They occupy the state's six ecoregions, which vary from the sagebrush plains of the Snake River plateau to the alpine grasslands found in the higher mountain elevations. Vast evergreen forests cover about two-fifths of the state, largely the mountainous terrain. Western white pine, white fir and other true firs, and Douglas fir predominate in northern forests, while Douglas fir, lodgepole pine, and ponderosa pine dominate the southern forests. Aspen, maple, willow, birch, and mountain ash often carpet the lower slopes of higher mountains, especially in the north.

Idaho is one of the few states in which grizzly bears and timber wolves roam free, although in very small numbers. Grays Lake National Wildlife Refuge, in the southeastern corner of the state, is the site of a long-term attempt to introduce the whooping crane, one of North America's endangered birds, and to use sandhill cranes as surrogate parents to further increase the birds' population size and range. Several other endangered plant and animal species occur in Idaho, including Macfarlands four o'clock (*Mirabilis macfarlanei*) and the woodland caribou.

Idaho is known for its wilderness areas and for its cold-water fish populations. Fishing for trout, including the Kamloops (Kootenai) and steelhead varieties, is found on many of the thousands of miles of rivers and streams in the state. Some of the most remote mountainous country in the nation—the Frank Church–River of No Return, Selway–Bitterroot, and Gospel Hump wilderness areas—constitutes the heart of Idaho and the largest contiguous

Margin notes (left column):
The Snake River

Endangered species

wilderness area in the coterminous 48 states. These wilderness areas and adjacent forested lands provide hunting for elk, Rocky Mountain goats, bighorn sheep, and mule deer. Idaho is also one of the few states in which there are large numbers of sage grouse and sharp-tailed grouse.

Settlement patterns. Many factors—religion, agriculture, transportation, topography, industry, cultural ties, and sectional pride—have contributed to Idaho's diverse regional characteristics. For many years writers and politicians consistently referred to the division of Idaho as northern Idaho—the 10 northern counties—and southern Idaho—the rest of the state. Studies of voting behaviour, however, indicate that four sections with distinct voting patterns have emerged: the 10 northern counties and three separate areas in the south, roughly the southwestern, the south central, and the southeastern sections. A more realistic regionalism has developed around trading and marketing centres, sometimes crossing the state boundaries. It consists of the following areas: Lewiston and Spokane, Wash., in the north; Boise, Twin Falls, Pocatello, and Idaho Falls in the south; and the Logan–Ogden–Salt Lake City axis in northern Utah.

With the exceptions of mining and lumbering settlements, most of the settlements in southern Idaho tend to follow the course of the Snake River. A narrow agricultural strip runs northeastward from Pocatello. Agriculture continues its dominance to the west as far as the Boise Valley, where the state's largest concentration of population is located. The Palouse and Camas prairies are primarily agricultural, while the Lewiston area is industrial and service-oriented. Mining, lumbering, and agriculture are important throughout the north, while rural villages centre around a community life that includes churches, schools, commercial trading, banking, and service businesses to support the region's population.

The people. The rural counties of Idaho continue to lose people to the cities, while farms and ranches continue to get larger. Most of the immigration comes from the Western, North Central, and Southern states, whereas the bulk of emigration goes to the West. The population is more than 95 percent white, most of whom trace their ancestry to the United Kingdom, Germany, Ireland, France, Italy, or Poland. American Indians constitute the second largest group, and there are also significant numbers of Asians, blacks, and Hispanics.

Boating on the Salmon River in the Frank Church–River of No Return Wilderness, Idaho.

Nearly half of Idaho's population are church members, and about half of them are Mormons. The next largest denominational groups are Roman Catholic, Methodist, and Presbyterian. The proximity to Mormon headquarters in Salt Lake City has resulted in strong religious ties to Utah, and the populations of some of the cities in the southeastern part of the state are more than 90 percent Mormon.

The economy. Economically, Idaho occupies a position between the highly developed and the underdeveloped states. Industrial expansion has replaced dependence on agriculture, lumbering, and mining in the 20th century, and Idaho has also emerged as one of the top states in tourist income. Government furnishes the second largest portion of Idaho's income. Labour, except in agriculture and small business, is heavily organized.

Agriculture and forestry. Huge herds of beef cattle and sheep graze not only in the prairie regions but also among the plateaus of the mountain regions. Idaho has some of the richest agricultural land in the United States, especially the irrigated region of the Snake River plain. Of the farm crops, potatoes have become almost synonymous with Idaho, though wheat, lentils, barley, oats, sugar beets, peas, beans, and alfalfa seed are important sources of farm income. Some two-fifths of the state's total area is in forests, and a huge quantity of lumber is cut from commercial timberlands each year. The primary commercial trees are Douglas fir, ponderosa pine, and western white pine.

Mining. Although the discovery of gold and the subsequent gold rush created Idaho's mining industry, gold is no longer important to the state's economy. Idaho, however, ranks among the three leading states in silver, lead, antimony, and molybdenum production. Phosphate mining and processing is important in the southeast.

Hydroelectric power, much of it provided by power stations on the Snake River, is the main source of energy for both business and private users in Idaho. Natural gas and oil have been used increasingly, while waste wood products have declined in importance. The Idaho National Engineering Laboratory near Arco, operated primarily as a research and testing site for nuclear reactors by the federal government, also is used for energy production.

Industry. Value added by manufacturing exceeds the contributions of agriculture to the economy. Much of it is related to the processing of foods and forest and mining products, however, indicating how dependent the economy remains on primary products.

Transportation. The wilderness and the mountains have made transportation difficult. Idaho has only one major highway connecting the southern and northern parts of the state. Almost all interstate highways that pass through the state run from east to west. Three transcontinental railroads cross the panhandle, and one railroad serves the southern portion. Geographic conditions influence air travel as well, with many small airfields providing service to remote areas. These airfields are used largely by private and contract fliers. Idaho has a water route to the Pacific Ocean from Lewiston by way of the Snake and Columbia rivers. Due to slack water that permits oceangoing barges to dock at Lewiston, the city is an important industrial and shipping centre.

Administration and social conditions. *Government.* Idaho operates under its original constitution of 1889, and, typical of states admitted to the Union after the Civil War, it has a constitution that establishes the usual separation of executive, legislative, and judicial powers but limits the governor's strength. The constitution is detailed and includes many provisions that rightly belong in the statutes; it has been amended more than 90 times.

The only change in the government between 1890 and 1914 was the creation of numerous service and regulatory commissions and boards largely independent of the governor. Administrative reorganization after World War I consolidated these agencies in an effort to make them democratically responsive. The Great Depression of the 1930s brought on dozens of new commissions and boards, however, and the growth has continued. In 1974 the state government was again reorganized. The executive branch consists of six elected officers, independent of the governor, and 19 departments, under which more

than 100 boards, commissions, councils, and committees are placed. The governor and other executive officials are elected to unlimited four-year terms. The legislature, which meets annually, comprises 42 senators and 84 representatives, and both senators and representatives serve two-year terms. Justice is administered by the Supreme Court, a court of appeals, and seven district courts and by county magistrate's courts. The district courts may originate cases and hear appeals.

Few voters in the nation are as independent as those of Idaho, and party cohesiveness is difficult to maintain; officials elected at one time often show a diversity of party and ideological stances. This independence usually is issue-oriented in state and national elections and personality-oriented in local elections. The two major political parties generally have dominated Idaho's political life. The voters have chosen Republican candidates slightly more than half the time, but the crossover vote, usually liberal and issue-oriented, can swing the outcome of any statewide election. The Republicans have long controlled the state legislature, but the governorship often is won by the Democratic Party. The preprimary party convention has been replaced by open primaries.

Voter independence

Idaho has more than 1,000 units of local government, including counties, municipalities, school districts, and special-purpose districts, the latter having limited taxing power. Most activities of local government are carried on by counties and cities. County commissioners, with a combination of legislative and executive functions, are very powerful. The state legislature has for many years refused to pass home rule legislation.

State debt is limited constitutionally to $2,000,000. The difficulty of achieving an equitable base for a sound system of public finance is increased by federal and state ownership of about 70 percent of Idaho's land area. The state's major revenue comes from personal and corporate income taxes and a sales tax, most of which is returned to public school districts. The state controls virtually no businesses or utilities except liquor sales, and among conditions made favourable to business development is the state's stance as a service rather than as a regulatory agency.

Education. Indian mission schools were supplemented by classes for white students when settlement began during the 1860s, and by the time of statehood the land-grant university had been chartered. The state Board of Education, dating from 1912, supervises appropriated funds, teacher certification, and related functions. The junior college system began on a district basis in 1939 and became a state function in 1965. The publicly supported University of Idaho (created in 1889 at Moscow), Idaho State University (1901, in Pocatello), and Boise State University (1932), as well as the private College of Idaho (1891, in Caldwell) and Northwest Nazarene College (1913, in Nampa), all offer advanced degrees. The University of Idaho is both a college of agriculture and the state's major educational institution. The university offers bachelor's and advanced degrees in areas that are related to the state's economy—engineering, mining, forestry, and wildlife and range science—and in other areas of business, education, and arts and letters.

Colleges and universities

Health and welfare. The electorate of Idaho is generally conservative on economic matters, but allocations for social and educational programs are liberal and are endorsed by both political parties. Nearly one-fifth of the state tax revenues goes into public health and public assistance programs. In addition, notable achievements have been based on a sense of social ethics, including a superior civil rights law. Living standards are relatively high because labour contracts follow national patterns, and living costs are below those of many states.

Idaho has several health districts that provide public health care throughout the state. Although Idaho has a low ratio of physicians to population and many rural hospitals find it difficult to remain open, the range of health services is comparable to that found in most U.S. states. All of the major cities have high-quality hospitals and excellent private medical services.

Cultural life. The opera houses in the mining camps, with various types of musical shows and serious drama,

Major crops

were Idaho's first "culture." The missionaries and the churches set the patterns of cultural development for a long period. The University of Idaho has taken a leading role in developing programs in music, art, architecture, creative writing, and theatre. Students who return to small towns are, in many instances, the only college-educated people in the community, with the exception of the local attorney and physician. Other institutions of higher learning have also developed strong fine arts programs.

Culturally young, Idaho has contributed artists with wide reputations, including Vardis Fisher, a novelist whose writing decried dogma and tyranny; and Carol Ryrie Brink, who wrote books for adults and children. Ernest Hemingway wrote many of his books while living in Idaho, which he enjoyed for its wilderness aspects.

All of the colleges and universities have symphony orchestras, choral groups, and theatre programs, and a number of cities—including Boise, Pocatello, and Moscow—have orchestras. The University of Idaho and the cities of Coeur d'Alene and Lewiston have summer theatres. The Idaho Commission on the Arts has sponsored and promoted the development of art exhibits, lectures, literature, films, theatres, and music throughout the state.

Idaho has created a statewide system of parks. In addition, there are several national parks, and part of Yellowstone National Park is in Idaho. Craters of the Moon National Monument is one of the rarest geologic creations in the United States. The U.S. Forest Service maintains many campgrounds throughout the state.

HISTORY

Early history and settlement. Before the 1840s, when the buffalo herds disappeared and the wagon trains of settlers who were bound for California began to arrive, Indians had lived in the Idaho region for at least 10,000 years. In the north were the Kutenai, the linguistically identical Salish (Kalispel), the Coeur d'Alene, and the Nez Percé. Northern Paiute lived in the west central region, while the western Shoshoni and the northern Shoshoni occupied most of the southern lands. Most of these groups lived in small villages, consisting largely of family groups that moved according to the fishing, hunting, and gathering seasons, and the ties between them were weak. The tribes still live in approximately the same areas, some on the several reservations that are located within the state.

Indian groups

When the Lewis and Clark Expedition reached Idaho in 1805, about 8,000 Indians lived in the region. A trading post was erected on Pend Oreille Lake in the north in 1809, and fur traders were followed by missionaries. Gold seekers by the thousands poured through the area on their way to California in 1848, but many returned eastward after gold was discovered in northern Idaho in 1860. The settlers who followed wanted land and political stability, which had hitherto been uncertain; and slowly agriculture acquired economic dominance.

Territorial period. Idaho originally was in Oregon country, which was claimed first by Spain and then by Russia, Great Britain, and the United States; after the latter two had settled on the 49th parallel as the northern U.S. border, the Oregon Territory was created in 1848. It included the present state of Idaho, as well as what is now Oregon, Washington, and part of Montana. From 1853 to 1859 Idaho was divided between the Oregon and Washington territories. It then was part of Washington until it was organized separately as the Idaho Territory in 1863.

Frontier days

From a population of fewer than 17,000 in 1863, the territory expanded to nearly 90,000 at the time of statehood in 1890. Many new arrivals were Confederate refugees who, in the years following the Civil War, often dominated the legislature and opposed the Republican governors who were appointed by the federal government. Political strife and vigilante committees were elements of frontier life during the territorial decades. Among the events and trends that coloured the state's political and social life were the religious conflicts between the polygamous Mormons (Church of Jesus Christ of Latter-day Saints) and other sects; a strong sectionalism that divided various regions of the territory; a pioneer democracy that emphasized the rights and achievements of the individual; the comple-

tion of railroads, which fostered economic and population growth; the beginning of lead and silver mining in the mountains; and the creation of the University of Idaho in 1889 by the last territorial legislature that was convened prior to statehood.

Statehood. Labour protests that often erupted into violence were features of the 1890s era in Idaho. Through his unsuccessful prosecution in 1907 of William D. Haywood, an organizer of the Industrial Workers of the World (IWW), Senator William Borah became Idaho's major national figure until his death in 1940. During the 20th century Idaho has been engaged in developing its agriculture, forestry, and industry, while maintaining the more satisfying aspects of modern life at the doorstep of a natural wilderness. (B.A.M.)

Montana

Although its name is derived from the Spanish *montaña* ("mountain," or "mountainous region"), Montana has an average elevation of only 3,400 feet (1,040 metres), the lowest among the Mountain states. The mountains sweep down from the Canadian province of British Columbia, trending northwest–southeast into western Montana, into Idaho on Montana's western and southwestern border, and southward into Wyoming. The eastern portion of the state, however, is a gently rolling landscape, with millions of grazing cattle and sheep, and with only scattered evidence of human habitation. It forms a part of the northern Great Plains, shared with the Canadian provinces of Alberta and Saskatchewan to the north, with the U.S. states of North and South Dakota to the east, and with northeastern Wyoming to the south.

Only three states—Alaska, Texas, and California—have an area larger than Montana's 147,046 square miles (380,848 square kilometres), and only two states—Alaska and Wyoming—have a lower population density. The residents are relatively far from the markets for their products, as well as from the nation's manufacturing and supply centres. The state is strongly oriented toward the outdoors, toward summer and winter sports, toward hunting and fishing, and toward the long-distance trip for socializing and entertainment or as a cure for prairie- or mountain-born restlessness.

Sparse settlement

In spite of its northern location, Montana is very much a Western state. The main street of the capital, Helena, is Last Chance Gulch, the city's original name and a reminder of the prospectors who invaded the hills in the 1860s to pan for gold. By 1889, when Montana became the 41st state of the Union, the cattle drive was an institution, and the state had begun to emerge as one of the leading copper-mining centres of the nation.

PHYSICAL AND HUMAN GEOGRAPHY

The land. The western two-fifths of Montana falls within the Rocky Mountains, and the eastern three-fifths lies upon the Great Plains. Rocky Mountain Montana is a land of high mountains, deep valleys, green forests, and treeless crest lines, whereas Great Plains Montana is a vast, horizontal sweep of yellow rangeland, golden grainfields, and brown fallow strips. This contrast between mountain and plain is the most powerful geographic feature of the state.

Relief. In Rocky Mountain Montana the mountain ranges are aligned generally from north-northwest to south-southeast. They are made up of ancient, hard rocks that were compressed, folded, faulted, and otherwise contorted by the mountain-building forces that created the Rockies.

Rocky Mountain Montana

During the last Ice Age, glaciers carved the mountain crest lines and high valleys from rounded, convex terrain into sharp, rugged, concave topography and, when they melted, left the loose earth material that they had gouged out of the mountains as glacial deposits in the valley bottoms. The glaciers in Montana today are very small compared to the great tongues of ice of the past. The bottoms of the valleys between the mountain ranges consist mainly of alluvial floodplains and terraces; of benchlands and foothills carved on young, soft rocks; and of plains, terraces, and foothills made up of glacial deposits.

There is a contrast within Rocky Mountain Montana between mountains with narrow valleys and those with broad valleys. In the narrow-valley regions, which are the most rugged and spectacular of the state, the valley floors are humid and forested. There are two narrow-valley regions. One is northwestern Montana, which includes Glacier National Park with most of Montana's glaciers. The other lies in south central Montana at the northern end of Yellowstone National Park; this area contains the highest point in Montana, Granite Peak, which has an elevation of 12,799 feet (3,901 metres) above sea level. These two narrow-valley regions are separated by a broad-valley area in west central and southwestern Montana. There the valley bottoms are wide, dry, and grassy, permitting sweeping panoramic views of the mountain ranges.

Great Plains Montana

Most of Great Plains Montana is rather rough land. The country south of the Yellowstone River is mainly scattered hills, which make up the Breaks of the Missouri around Fort Peck Lake, with genuine plains found in the "Golden Triangle" north of Great Falls and plateaus elsewhere. Some of the hills, breaks, and valley bluffs form rugged badlands. The valleys of the major rivers flowing from the Rocky Mountains across eastern Montana are deeply incised. Scattered upon the plains and plateau surfaces are eight small mountain masses called Rocky Mountain outliers, which are like islands of the Rockies set out upon the plains.

The rocks underlying Great Plains Montana, except for the mountain outliers, are young, soft, and more or less horizontal. Roughly north of the Missouri River the plains rocks are covered by glacial deposits left by the continental ice cap, which occupied the area at the same time that alpine glaciers were sculpting the mountains to the west. The bottoms of the incised valleys are made up of alluvial floodplains, terraces, and soft-rock benchlands.

Drainage. Montana is the only state in the Union from which waters flow to Hudson Bay, the Gulf of Mexico, and the Pacific Ocean. The northwestern section of the state lies west of the Continental Divide and is drained to the Columbia River—and thus ultimately to the Pacific— by the Kootenai River, the Clark Fork, and its major tributary, the Flathead River. The Flathead flows into and then out of Flathead Lake, the largest natural lake in the state. The Kootenai flows out of Montana at the lowest elevation in the state, 1,820 feet (555 metres) above sea level. East of the Continental Divide Montana is drained by the Missouri River and its principal tributary, the Yellowstone. The Missouri is a tributary of the Mississippi River, which flows into the Gulf of Mexico and thus is part of the Atlantic Ocean drainage system. Finally, a small portion of Montana on the eastern slope of Glacier National Park drains ultimately to Hudson Bay.

Soils. On the mountain ranges and outliers the soils are mostly derived from the underlying, hard bedrock and are too steep and stony to be cultivated. In Great Plains Montana the soils south of the limit of glaciation are derived from the underlying, soft, Great Plains rocks. Most of the soils in the north, formed in glacial deposits, are undulating to rolling and generally are better for cultivation than the rougher lands with residual soils to the south. In the valley bottoms most of the soils are formed from unconsolidated alluvial and glacial deposits and are productive for crops when irrigated.

Climate. The climate of most of Great Plains Montana is semiarid, with warm summers and cold winters. Average annual precipitation is scant, about 13 inches (330 millimetres). Total snowfall is light. The chinook, a warm winter wind that blows on the plains near the foot of the Rockies, periodically interrupts the bitter cold—with January temperatures averaging 18° F (−8° C)—for which Montana is notorious.

In Rocky Mountain Montana there are several different climates arranged one above the other in altitudinal zones. The climate of the lowest zone—the dry valley bottoms— is similar to that in eastern Montana. The climates of the other zones become progressively cooler, wetter, and more snowy with higher altitude.

Plant and animal life. For the most part, Rocky Mountain Montana is forested and Great Plains Montana is grassland. In the Rocky Mountains and on the mountain outliers the vegetation, like the climate, is arranged in altitudinal zones. In the dry valley bottoms below the lower timberline are grassland, brushland, and open stands of trees called parklands. In the timbered belt on the mountainsides the vegetation is coniferous forest dominated by Douglas fir. The treeless crest lines above the upper timberline are made up of low alpine tundra vegetation, barren rock, and glaciers. In most of Great Plains Montana, where the land is not cultivated, the vegetation is short-grass grassland. Along the base of the Rockies are foothill prairie grasslands. Many of the hilly areas on the plains are covered by prairie parklands.

Montana has an abundance of rare and imposing species, notably grizzly bears, Rocky Mountain goats, bighorn sheep, and moose. These animals live mainly in the mountains along with more common species, such as American elk, mule deer, black bears, mountain lions, bobcats, and forest grouse. The grassland animals of Great Plains Montana and of the grassy western valleys include pronghorn, mule deer, coyotes, badgers, and plains grouse. Distributed nearly statewide along and near streams and lakes are white-tailed deer, beavers, muskrats, mink, bald eagles, ring-necked pheasant, ducks, geese, and swans.

Wildlife

Settlement patterns. The population of Montana is small, sparse, and unevenly distributed. In the two narrow-valley mountain areas the population is aligned in thin strips along the valley bottoms and towns are small. The broad-valley region has a heavy population by Montana standards, and some of the state's major cities and large towns, including Missoula, Butte, Helena, Bozeman, Kalispell, Anaconda, and Livingston, are located in the irrigated districts on the dry valley floors.

In Great Plains Montana there are continuous bands of relatively dense population along the irrigated bottoms of the major incised valleys. All of the cities and major towns, except Lewistown, are lined up like beads on a string along these strips. Along the Yellowstone River are Billings, Miles City, Glendive, and Sidney; and along the Missouri River and its tributary, the Milk River, are Great Falls, Havre, and Glasgow. Population is moderately dense and fairly evenly spaced in the dryland grain areas, but it is sparse and uneven in the livestock-ranching areas.

The people. Most of the inhabitants of Montana today trace their ancestry to the countries of western, northern, and, to a lesser degree, eastern Europe—mainly Great Britain, Ireland, Germany, France, The Netherlands, the Scandinavian countries, and Poland.

The one significant exception is the American Indians. Montana has seven Indian reservations and an Indian minority of about 5 percent. Nearly two-thirds of the Indians live on the reservations and most of the rest in the cities near the reservations, notably Missoula, Great Falls, and Billings. Blacks make up only a tiny fraction of the Montana population. Few blacks are permanent citizens of the state but—like the small Asian and Hispanic populations—are temporarily in Montana for employment or educational opportunities.

Indian population

About half the inhabitants of Montana are affiliated with organized religious groups. Mormonism has increased in Montana. Many of the Indians were nominally converted to Roman Catholicism by missionaries.

The economy. Montana's economy is dominated by the primary sector—agriculture, forestry, mining, and energy production. The outdoor recreation industry, however, has also become important, and some high-technology industries have come to the state.

Agriculture. Beef cattle. sheep, grain, sugar beets, potatoes, and fruit are produced on irrigated farms in the broad, dry valleys of Rocky Mountain Montana and in the incised valleys in Great Plains Montana. Wheat and barley are grown on large dryland grain farms throughout the two major grain-growing regions—the Golden Triangle and northeastern Montana—and in patches elsewhere. Most of the rest of the state is rangeland and is used in the livestock-ranching industry for the production of beef cattle and sheep. There is some meat packing, flour milling, and sugar refining in Montana, but most of the farm and ranch products are processed outside the state.

Mining and water resources. Coal is one of the major mineral resources of Montana. Along with petroleum and natural gas, coal is extracted from the young, soft rocks of Great Plains Montana. Coal-fired, thermoelectric plants are located at Colstrip and Billings. Silver, gold, copper, platinum, talc, phosphate, vermiculite, sapphire, and other minerals are mined from the old, hard rocks of Rocky Mountain Montana and of the mountain outliers. There is a lead smelter located at Helena and an aluminum plant at Columbia Falls.

Oil and gas production Petroleum was discovered in commercial quantities at Elk Basin in 1915. The Elk Basin, Kevin-Sunburst, and Cut Bank fields led in production of petroleum and natural gas for several years. The great Williston Basin was developed in 1951, but the Bell Creek field in Powder River county has been the most productive. Large petroleum refineries are located at Billings and Laurel.

Montana's tremendous water resources provide for hydroelectric power production and for uses in other sectors of the economy. Runoff from the forested sides of the Rocky Mountains and the outliers recharges groundwater, fills lakes and reservoirs, and generates the flow of the great rivers. There are several large dams, power stations, and reservoirs, which are clustered mainly in the mountains of northwestern Montana.

Forestry. Lumbering and the manufacture of forest products are vital to western Montana. Of the more than 14,000,000 acres (5,700,000 hectares) of commercial forestland, more than two-thirds is owned by the federal and state governments. The forestry industry includes the manufacture of plywood and of pulp and paper products. About one-third of Montana's forest products are sold to states in the Midwest.

Services. A large majority of all jobs in Montana are in the service sector; Billings, Great Falls, Missoula, and Butte are the state's major regional service centres. Tourism has become a significant component of Montana's economy.

Transportation. Railroad passenger service and total route length in Montana have decreased since the 1960s. Total highway mileage in Montana is relatively low, but there is a well-developed network of interstate and primary highways between population centres. Several major airlines and air-taxi lines serve the state, and many small planes are privately owned.

Administration and social conditions. *Government.* Montana's original constitution, adopted upon statehood in 1889, was replaced by a new one in 1972. The new document provided for a voter initiative process that has been used vigorously in attempts to enact new laws and to amend the constitution itself.

Allegiance is so evenly divided between the Republican and Democratic parties that election patterns are not predictable. Ticket splitting is common. The governor and the lieutenant governor are elected on one ticket, and both serve four-year terms. The state has an open primary, voters need not declare party affiliation, and registration is permanent unless a voter does not vote within four years.

The executive branch comprises 19 cabinet-style departments, with virtually all appointments directly controlled by the governor. The two-house legislature meets in odd-numbered years for 90-day sessions and is composed of 50 senators and 100 representatives.

Judges are elected without party designation. The highest court is the seven-member Supreme Court. The state is divided into 19 judicial districts, in which 36 district judges serve. On the lowest level are justices of the peace and police judges.

The county is the highest level of local government. Its powers and duties are defined and limited by state statutes. Three elected commissioners are the chief administrators, though a full-time manager may be employed instead. Municipal governments, like those of counties, derive all their authority from the state. They can, however, enact local ordinances, whereas counties cannot. Municipalities have police forces, and each county has an elected sheriff, who appoints deputies and has jurisdiction outside towns and cities. Because cattle rustling is a continuing problem, some sheriffs and deputies act as brand inspectors to prevent the sale of stolen livestock.

Education. Although rural schools continue to consolidate and introduce bus transportation, many children attend small and not always adequate one- or two-teacher country schools. School districts are corporate bodies headed by a county superintendent of schools and governed by elected school boards.

The state's system of higher education, chartered in 1893, Higher includes universities at Missoula and Bozeman; regional education four-year colleges at Billings, Havre, and Dillon; and a college of mineral science and technology at Butte. There are also a number of church-affiliated private colleges, junior colleges, and public postsecondary vocational-technical schools.

Health and welfare. Montanans pay various penalties for the wide-open spaces they enjoy. An increasing number of communities have no dentist, physician, or hospital. Montana's welfare program is state-supervised and administered by county departments of public welfare. Because of sparse population and few private social service agencies, costs are relatively high. Welfare departments are caught between pressures from taxpayers to curb programs and from organized low-income groups to provide wider services. There are special programs on Indian reservations.

Cultural life. Most artistic activity centres in the cities with colleges and universities, several of which sponsor visits by lecturers and professional artists of various kinds in addition to the presentation of the work of faculty members and students. Several cities have symphony orchestras that include some professional musicians.

The Montana Institute of the Arts, founded in 1948, is a grass-roots organization that ties together the scattered, often isolated practitioners of various arts and crafts through publications, an annual festival, and traveling exhibits. The Montana Arts Council, a state agency affiliated with the National Endowment for the Arts, funds dozens of local cultural organizations, primarily for music, drama, dance, literature, and the visual arts. There are summer theatres in a number of communities; and the Montana Repertory Theater, based in Missoula, tours both inside and outside the state.

Several Indian tribes hold traditional dance ceremonies at which outsiders are welcome. There is an annual reenactment of the Battle of the Little Bighorn on the Crow Indian Reservation. Rodeos abound, as do square-dance

groups, and Montana is a thriving centre for old-time fiddling. In Red Lodge an annual nine-day Festival of Nations, originated to ease tensions among European ethnic groups of coal miners, has become a tradition.

Historical and art museums

The Montana Historical Society maintains a museum, art gallery, and specialized library in Helena. The C.M. Russell Museum, in Great Falls, specializes in the works of the cowboy artist Charles Marion Russell. Billings is the location of the Yellowstone County Fine Arts Center and the Yellowstone County Museum. The excellent, small Museum of the Plains Indians is in Browning. Many communities nurture art galleries and small museums of local historical interest.

Montana's spectacular scenery is one of its premier recreational attractions. A large proportion of the state's land is given over to state and national parks, forests, recreational areas, wildlife refuges, and wildernesses, which provide venues for a wide range of outdoor recreational activity.

HISTORY

Settlement. At the beginning of the 19th century the Crow Indians occupied the south central portion of present-day Montana, the Cheyenne the southeastern corner, the Assiniboin and Atsina the northeastern corner, the Blackfoot the central and north central area, and the Kutenai the northwestern corner. The Pend d'Oreille had a territory around Flathead Lake, the Kalispel were in the mountains west of there, and the Flathead occupied the Clark Fork and Bitterroot valleys. The southwestern corner was disputed territory. The Flathead were later forcibly moved to their present reservation in the Flathead valley. Most of the other tribes are now living on reservations within their respective territories.

The first white explorers known to have set foot in Montana were the members of the Lewis and Clark Expedition (1804–06). Fur trappers and traders followed, setting up forts to trade with the Indians. The only early trading post to survive as a present-day town was Fort Benton, which was established in 1846 and became an important port on the Missouri River. Roman Catholic missionaries followed the fur traders and in 1841 established Saint Mary's Mission near present-day Stevensville, believed to be the first permanent settlement in Montana. Trailblazers carved the northern Overland Route to Montana from the east, the Bozeman Trail from the southeast, and Mullan Road westward from Fort Benton, the head of navigation for steamboats on the Missouri.

Mining era

Gold prospectors flocked in after rich placer deposits were discovered in the early 1860s. Montana Territory was established in 1864 with Bannack, in Grasshopper Creek, its first capital, and Virginia City, in Alder Gulch, its second. As pressure from white settlers increased, the Indians fought to protect their hunting grounds. The Dakota (Sioux) and Cheyenne won their last major victory in June 1876 at the Battle of the Little Bighorn. A band of Nez Percé under Chief Joseph won a battle in the Big Hole Basin the following year and fled toward Canada, only to be met and defeated by U.S. troops a few miles south of the international boundary.

Hard-rock mining began in the 1880s, and Montana became a state on Nov. 8, 1889, with Helena as the capital. Butte began as a gold camp, but shaft mining commenced when vast deposits of copper were discovered there. Butte subsequently became known as the "Richest Hill on Earth," and the world's largest smelter was built at nearby Anaconda. The so-called War of the Copper Kings was won by Marcus Daly, whose Anaconda Company became one of the largest mining conglomerates in the world. The company smashed the mining unions, influenced the state legislature, acquired almost all of Montana's daily newspapers, and virtually controlled the state for three-quarters of a century.

Cattle and sheep grazing in Great Plains Montana started in the 1860s, when herds were driven overland from Texas. The vast grasslands seemed ideal for cattle, but a severe winter in 1886–87 virtually wiped out the herds. Beginning around 1900, homesteaders began pouring into the plains country to bust the sod and grow grain on dry land. After a few years of bumper crops and high prices, a series of dry years brought financial disaster and mass exodus.

Oil and natural gas production began in Great Plains Montana in 1915, expanded greatly in the 1950s, and peaked in the 1960s. Coal mining, which began in the days of coal stoves and steam locomotives, increased dramatically in the 1970s.

The closing of the copper mines at Butte, the smelter in Anaconda, and the copper refinery at Great Falls in the early 1980s marked the end of the copper century and a turning point in Montana's history. The state no longer relies so heavily on the primary economic sector; more emphasis is placed on tourism and on new and innovative businesses that provide jobs without causing deterioration of the state's magnificent mountains, crystal waters, and wide-open spaces. (D.M.J./J.M.C.)

Nevada

Located in a mountainous region that includes vast semiarid grasslands and sandy alkali deserts, Nevada became the 36th state of the United States on Oct. 31, 1864. Its name was derived from the Spanish *nevada* ("snow clad"), a reference to the high mountain scenery of the Sierra Nevadas that are located on the state's southwestern border with California. Other neighbouring states sharing many of the geographic features that make Nevada the nation's most arid state are Oregon and Idaho to the north, Utah to the east, and Arizona to the southeast. Nevada is the seventh largest of the 50 states, but it is also one of the most sparsely settled. Carson City is the state capital.

Nevada appears far removed from the days when Virginia City was a fabled frontier town, thriving on the rich silver mines of the Comstock Lode. However, many frontier qualities persist, though subtly transformed by a sophisticated urban environment. The prospector digging against odds to find a bonanza has been replaced by the fortune seekers in the gambling casinos of Las Vegas and Reno, and the erstwhile "saloon diversions" have evolved into lavish nightclub entertainment.

While the great majority of Nevadans live in the two main cities—more than one-half of them in the Las Vegas metropolitan area and almost one-fourth in that of Reno—the undeveloped lands of the state provide a largely unknown resource. Combined with the major sci-

Superstock

Virginia City National Historic District on the eastern slope of the Sierra Nevada range, western Nevada.

entific activity related to the federal government's atomic research facilities, the modern cities and desert reaches make Nevada a unique phenomenon among U.S. states.

PHYSICAL AND HUMAN GEOGRAPHY

The land.   *Relief.*   Most of Nevada lies within the Great Basin section of the Basin and Range Province, where the topography is characterized by rugged mountains, flat valleys with occasional buttes and mesas, and sandy desert regions. More than 30 north–south mountain ranges cross the state; the highest elevations are Boundary Peak, at 13,143 feet (4,009 metres), and Wheeler Peak, at 13,063 feet. The southern area of the state is within the Mojave Desert, and the lowest elevation, 470 feet (143 metres), is in the Colorado River Canyon.

Drainage.   The state's rivers depend on the melting of winter snows and on spring rainfall. Almost all of the rivers drain into lakes that have no outlets or into shallow sinks that in summer evaporate into alkaline mud flats. The Humboldt, the largest of Nevada's rivers, provides the state's only major east–west drainage system. The Truckee, Carson, and Walker rivers, which rise in the Sierra Nevada, serve extensive irrigation and reclamation projects in their areas. The Muddy and Virgin rivers in southern Nevada are related to the Colorado River system.

Several lakes provide scenic and recreational attractions. Lake Tahoe on the California–Nevada border is particularly notable for its clarity, depth, and scenic beauty. Pyramid, Walker, and Winnemucca lakes are remnants of an ancient sea. In relation to its area, however, Nevada has little surface water. The increasing demands of urbanization, industry, and agriculture are exhausting both groundwater and surface resources, and scarcity of water is an increasing concern. The impounded waters of Lake Mead, extending for 117 miles (188 kilometres) behind Hoover Dam, provide reserves for the southeastern area.

Scarcity of water

Climate.   The high Sierras along the state's western boundary often cause clouds of Pacific origin to drop their moisture before reaching Nevada, thus producing a semi-arid climate. The driest regions are in the southeast and near Carson Sink, where annual rainfall seldom exceeds four inches (100 millimetres). The northeast has as little as eight inches of precipitation, whereas that of the northwestern mountains often reaches 24 inches. Temperatures vary as widely. In the north July temperatures average 70° F (21° C), and in the south 86° F (30° C). In January the averages range from 24° F (−4° C) in the north to 40° F (4° C) in the south. The northern and eastern areas have long, cold winters and short, relatively hot summers, whereas in southern Nevada the summers are long and hot and the winters brief and mild. Regional differences are pointed up by variations in the growing season: Las Vegas has 239 days, Reno 155, and Elko only 103.

Plant and animal life.   Despite aridity and rugged terrain, Nevada shows considerable variety in vegetation. In the lower desert areas, mesquite, creosote, greasewood, yucca, and more than 30 varieties of cacti abound, while sagebrush and Joshua trees flourish at the higher elevations. Throughout the state, particularly during the period after the spring rains, more than 2,000 varieties of wildflowers have been identified. Mountain forests contain pine, fir, and spruce as well as juniper and mountain mahogany. The piñon pine is characteristic in the high mountain regions, and the rare bristlecone pine—one of the oldest living species of trees—is native to the Toiyabe Range.

The animal population of Nevada includes those species that are best adapted to temperature extremes and to lack of moisture. Among the larger animals are bighorn sheep, several varieties of deer, and the pronghorn. Rabbits and other rodents are found in abundance. The desert harbours such reptiles as geckos, horned toads, tortoises, and sidewinder rattlesnakes. Predators such as the coyote and bobcat are common. The permanent bird population of the state is somewhat limited, but there are seasonal visitations by a great variety of migratory birds. Game birds that can be found in the state include sage grouse, pheasant, and quail; and Nevada's rivers and lakes contain large quantities of bass, trout, crappie, and catfish.

The people.   The majority of Nevadans are of Euro-pean ancestry, almost 90 percent of whom were born in the United States. An estimated 5,000 to 10,000 persons trace their ancestry to Basques recruited as sheepherders from their Pyrenean homeland. Spanish-speaking Americans, mainly those of Mexican and Cuban origin, are concentrated in the southeast. Descendants of the Paiute, Shoshoni, and Washoe Indians live on several reservations. Blacks, mostly in the Las Vegas and Reno areas, make up a very small percentage of the state's population.

The predominant religious groups are Mormons and Roman Catholics. There are a variety of Protestant denominations and a Jewish minority.

From the 1950s through the '70s Nevada's population grew by about 70 percent, and by the mid-1980s it was expanding three times faster than that of the nation as a whole. In spite of a birth rate slightly above, and a death rate slightly below, the national average, this growth was largely the result of immigration from other states. The impact of this immigration has been felt most strongly in Las Vegas and surrounding Clark county and in Reno and surrounding Washoe county. Most Nevadans are urban and are engaged in the booming economies of those two metropolitan areas.

Immigration and urbanization

The economy.   Although the traditional bases of Nevada's economic life, mining and agriculture, remain important, they are far overshadowed by manufacturing, government, and tourist-related services.

Mining.   One of the richest mineral regions of the nation extends eastward from California across Nevada and into Arizona. Copper production, which had been the largest component of mineral production, dropped dramatically in the 1970s and '80s, when the state's leading copper producers shut down operations. Copper is now produced only as a by-product of gold-mining operations. Gold has replaced copper as the most commercially valuable of the state's minerals, and the annual output is among the highest in the nation. Nevada is also the leading producer of barite and mercury. The McDermitt Mine in Humboldt county is the largest single source of mercury in the United States. Although silver production dropped in the late 1970s, new mines began operation in the 1980s. Other important minerals include gypsum, sand and gravel, crushed stone, tungsten, and magnesium. Petroleum was discovered in Nye county in 1954, and commercial production began in the 1970s.

Agriculture.   Nevada's agriculture depends on irrigation. Even in the river valleys, farmers and ranchers pump additional groundwater for their crops and livestock. About 750,000 acres (300,000 hectares) are classified as cropland, compared with about 7,600,000 acres of pasture and rangeland. In the 20th century farms and ranches have increased in acreage while declining in number.

Croplands are devoted mainly to forage and feed crops, with alfalfa the major commercial crop. Livestock ranching, however, is the primary source of agricultural income. The large cattle and sheep ranches are chiefly in Elko, Humboldt, and Lander counties. Most of the cattle are shipped to California or the Midwest for fattening and marketing. Dairy and poultry farms have become important in western and southeastern Nevada, where horse ranches also have been developed.

Ranching

Nearly one-fifth of Nevada's total acreage is devoted to forests and woodlands. More than 5,000,000 acres have been designated as national forests, and private holdings support only a small-scale lumber industry. Aside from lumber production, the forests are of importance for the conservation of water and wildlife and in providing recreational opportunities.

Industry.   Manufacturing has expanded and diversified, and most of the larger enterprises are located in Clark or Washoe counties. The leading product groups are stone, clay, and glass products; printing and publishing; food and food by-products; and chemicals. The largest industrial complex is located in Henderson, where major factories process titanium ore and produce industrial chemicals.

Most of the electricity is generated by coal and natural gas, but a small amount is produced by hydroelectric plants. Coal and natural gas are used in power plants in southern Nevada. Hoover and Davis dams are major

power sources, supplemented by imports of hydroelectric power from California and Oregon.

About 85 percent of Nevada's land is owned by the federal government. Following establishment of the Nevada Test Site by the federal government in the 1950s, a complex of research and development enterprises, mainly in the aerospace, civil defense research, biomedical environmental protection, and electronics fields, developed in the Las Vegas area. These industries have come to rival similar industries in California and in the Boston and Washington, D.C., areas. The test site itself is a major centre for underground nuclear detonation and for 15 years, until 1972, for nuclear rocket development. Thousands of military personnel are stationed also at Nellis Air Force Base and Fallon Naval Air Station.

Tourism.   Tourism and its related activities bring millions of visitors; contribute more income than mining, agriculture, and manufacturing combined; and employ about one-third of the work force. Although millions of people visit Lake Mead and other recreational and scenic areas, the tourist industry centres on several attractions that largely are unique to Nevada among the U.S. states.

Legalized gambling and related lures

The 24-hour-a-day gaming casinos bordering The Strip and Glitter Gulch in Las Vegas are the most publicized aspect of the legal gambling industry. Important adjuncts to the casinos are the luxury hotels, gourmet restaurants, golf courses, and nightclubs that have made Las Vegas—and, to a lesser extent, Reno and Lake Tahoe—a major centre of live entertainment in the nation. Small towns also emphasize the hospitality industry and tourism. Unique to the rural counties of central Nevada is legal prostitution.

Transportation.   Its vast size makes Nevada heavily dependent upon air transportation. The state is served by several national airlines. There are numerous airports and airfields, and both Las Vegas and Reno have been designated as international ports of entry.

Three major railroads cross the state, while short lines serve as feeders where truck competition has not caused their discontinuance. Nevada's public roads include primary and secondary highways as well as municipal and rural roads. Two of the federal highways are part of the interstate system.

The three major transportation and trade centres of the state are Reno, the principal distributive centre for northwestern Nevada and northeastern California; Elko and Ely, in northeastern Nevada; and Las Vegas, the commercial centre for southern Nevada and nearby areas of Utah and Arizona. Warehousing and trucking industries flourish because of Nevada's strategic geographic location and the "free port" tax exemption for goods continuing in transit.

Administration and social conditions. *Government.* Nevada is governed under its original constitution, adopted in 1864 but since amended in many respects. The chief officials, including the governor, lieutenant governor, attorney general, secretary of state, controller, and treasurer, are elected to four-year terms. In addition to the usual departments and agencies supervising areas of public concern, the state Equal Rights Commission oversees areas of discrimination of various kinds, while the Gaming Control Board oversees operations of the gambling industry.

Nevada's bicameral legislature comprises the Senate of 21 members elected for four-year terms and the Assembly of 42 members elected for two-year terms. It convenes in January of odd-numbered years.

The highest judicial body is the Supreme Court, composed of a chief justice and four associate justices. There are also district courts, subdivided into departments on a population basis. Cities and townships have courts staffed by municipal judges and justices of the peace. All judicial offices are subject to nonpartisan elections.

Local government comprises 16 counties, 16 cities, and 56 townships. As Nevada traditionally has been rural-oriented, the county remains the primary unit of local administration. Each county has a public administrator, board of commissioners, district attorney, sheriff, and other officials. Cities and towns are incorporated under charters granted by the legislature, most of them with a mayor–council form of government.

Finance.   Nevada's fiscal policies have been markedly conservative. The constitution rigidly limits both taxation and indebtedness. The bonding capacity cannot exceed 2 percent of the total assessed valuation of real property in the state, and there is a maximum tax rate on real estate. Even more unusual is the absence of state taxation upon inheritances and all types of income. A gaming tax and the sales tax are the principal sources of state income. State taxation provides about two-thirds of general revenue, with most of the balance coming from federal grants and subventions.

Education.   The public school system is controlled by an elected Board of Education, which delegates administrative responsibilities to an appointed superintendent of public instruction. Local school districts, coextensive with the counties, receive supplementary funding from the state. School attendance is compulsory for those between the ages of seven and 17.

The University of Nevada originally was established at Elko in 1874 under the provisions of the Morrill Land-Grant College Act; 12 years later it was moved to Reno. In 1951 an extension branch was established in Las Vegas, which since has become the autonomous University of Nevada, Las Vegas. There are two-year community colleges in Elko, Carson City, Reno, and North Las Vegas. To supplement campus instruction the Desert Research Institute and the Agricultural Experiment Stations provide statewide research services.

Institutions of higher education

Health and welfare.   Nevada's welfare programs and its custodial institutions are administered by the Department of Human Resources. Old-age and welfare allotments are given on the basis of need, and public assistance is available for the blind and other handicapped residents. Support payments are provided for dependent children, and orphanages are located near Carson City and Boulder City. The state mental hospital is in Sparks, and there is a mental health facility in Las Vegas. Penal and rehabilitation institutions include the state prison in Carson City, auxiliary prisons in Jean and Indian Springs, a girls' training centre at Caliente, and an industrial school for boys at Elko. Health care, housing, and public safety are responsibilities of local government or private enterprise.

Cultural life.   Nevadans traditionally have mingled rural conservatism and the individualism of the Old West. Until the mid-20th century its population was small and dispersed, and cultural values were those of an agrarian society. With the establishment of resort industries and increases in population, however, Las Vegas and Reno developed marked metropolitan characteristics. Not only has the economy diversified but cultural activities also have burgeoned. Recognizing this trend, in 1967 the state legislature established the Nevada State Council on the Arts to coordinate and stimulate cultural activities.

Both major cities have well-established programs in the performing arts. The universities sponsor lectures, concerts, and theatrical productions, while the tourist industry regularly features some of the most famous entertainers in show business. Both Reno and Las Vegas support symphony orchestras and have commercial and public art galleries. Traditional Indian arts and crafts have been revived on reservations and in urban colonies.

Nevada's frontier heritage is commemorated by annual pageants and festivals. During Helldorado Week, held in Las Vegas each May, the townspeople wear Western garb and stage a series of rodeos and parades. There is a Basque Festival in Elko, and the Reno Rodeo is an outstanding Fourth of July celebration. The state observes its anniversary, Admission Day, on October 31, highlighted by a parade and costume ball in Carson City.

Old West festivals

The Nevada State Museum, in Carson City, emphasizes the mining industry and mineral collections. Anthropological artifacts are featured at the Lost City Museum in Overton, at the Museum of Natural History in Las Vegas, and at the Southern Nevada Museum in Henderson. The Mackay School of Mines Museum, on the Reno campus of the state university, is oriented toward metallurgical, mineralogical, and geologic specimens. The Nevada Historical Society, also in Reno, has pioneer mementos, the most complete holding of Nevada newspapers, and a sizable historical reference library. The library of the University

of Nevada, Reno, has the largest collection of books in the state, while the Nevada State Library in Carson City is notable for its excellent collection of legal works.

The state and federal governments maintain parks, forests, historical monuments, and recreational areas. The Valley of Fire State Park, near Overton, is known for its brilliantly coloured rock formations and Indian petroglyphs. Mormon Station Historic State Monument, in Genoa, is the site of the first permanent settlement in Nevada; the Death Valley National Monument is on the border between Nevada and California. Red Rock Canyon, with unusual high-desert terrain and a spectacular multicoloured escarpment, is near Las Vegas, and Cathedral Gorge State Park, near Pioche, displays red and gold rocks that resemble church spires. Humboldt National Forest, in east central Nevada, includes the Jarbidge Wilderness and the Ruby Mountains. The Lake Mead National Recreation Area, which contains Hoover Dam, has fishing, boating, and swimming facilities; and Great Basin National Park, featuring the Lehman Caves and the Wheeler Peak area, is located near the Nevada–Utah border.

HISTORY

Archaeological evidence indicates that prehistoric Indian settlements existed in Nevada more than 20,000 years ago. Cave dwellers left picture writings on rocks in southern Nevada, and Basket Makers and Pueblo Indians also flourished there. Explorers of the early 1800s found Mohave, Paiute, Shoshoni, and Washoe Indians at various locations within Nevada.

Explorers and settlers. Missionaries and fur traders were in the vanguard of the exploration of the Nevada area. The missionary travels of Francisco Garcés from New Mexico to California in 1775–76 were imitated by other Spanish Franciscans. In 1825 Hudson's Bay Company trappers explored the northern and central region, and two years later Jedediah Smith led a party of Americans into the Las Vegas Valley and across the Great Basin. By 1830 the Old Spanish Trail was bringing traders to the area from Santa Fe and Los Angeles, and in 1843 and 1845 John C. Frémont's explorations publicized the Great Basin and the Sierra Nevada region. During the 1840s pioneers followed the Humboldt Valley–Donner Pass route to the Pacific Coast, and the gold rush of 1849 greatly expanded migration through Nevada to California.

Nevada, which came under U.S. sovereignty through the Mexican cession of 1848, was a part of California until it was incorporated into the newly organized Utah Territory in 1850. In 1849 a settlement was made at Genoa (then Mormon Station) in Carson Valley, but the population remained sparse until the discovery of the famous Comstock Lode in 1859. From that time on Nevada ceased to be merely a highway for gold seekers on the way to California. Virginia City became the most famous of all the Western mining camps, and the rapid influx of prospectors and settlers resulted in the organization of Nevada Territory in 1861.

The American Civil War gave strategic importance to the new territory. President Lincoln realized that Nevada's mineral wealth could help the Union, and he also needed a Northern state to support the proposed antislavery amendments to the Constitution. Although Nevada Territory had only about one-fifth of the 127,381 persons required for statehood, Nevadans were encouraged to seek admission to the Union. Congress accepted the proposed state constitution and voted for statehood in 1864.

Mining and cattle-ranching decades. In its early decades Nevada's economy was dependent on mining and ranching. The rich Comstock mines reached a maximum annual output of $36,000,000 in silver in 1878. During the 1870s, however, the federal government limited the role of silver in the monetary system, causing a decline in silver prices, the closing of many Nevada mines, and the decay of once thriving communities into ghost towns.

As mining declined, cattle ranching became a major industry. Beef prices, however, were unpredictable, high railroad rates were burdensome, and severe winters often killed thousands of cattle. In the late 1880s many cattle ranchers were forced into bankruptcy. Depressed in mining and ranching, the state's population dropped from 62,000 in 1880 to 47,000 in 1890.

Prosperity returned to Nevada only after the beginning of the 20th century, when rich silver ores were discovered near Tonopah and major copper deposits around Ely and when a major gold strike occurred at Goldfield. Thousands of miners answered the lure of these bonanzas, and the railroads built extensive branch lines to bring in equipment to the mining areas and haul out the ore. Accessible railroads and reduced rates also encouraged cattle ranchers to renew large-scale production. Irrigation of fertile river valleys produced sizable hay crops. Thus assured of winter feed, ranchers further expanded their herds in the upland regions. World War I demands for Nevada's beef and metals kept the boom going, but the failing markets of the 1920s brought the return of economic depression.

During its first three decades as a state, Nevada was oriented to Republican control. Reflecting the lax standards in national politics, the state was often manipulated by corrupt politicians. Mine owners and ranchers frequently subsidized government officials, and there were accusations that rich men in the state had bought seats in the U.S. Senate. Monetary issues became of paramount importance in the 1890s, and the Free Silver Party swept four consecutive state elections. By 1900, however, the traditional two-party system was again in control, and since then Nevada has voted consistently with overall national trends.

Creation of a modern economy. Nevada began its transition to a modern economy during the Great Depression of the 1930s. After the legalization of gambling in 1931 and the reduction to six weeks of the residence requirement for divorce, Nevada became a marriage, divorce, and resort centre. The principal resort areas are Las Vegas, Reno, Laughlin, and Lake Tahoe. Las Vegas attracts many tourists from southern California and foreign countries and also hosts business and professional conventions. Reno draws many pleasure seekers from the San Francisco Bay area and from the Pacific Northwest. Laughlin emerged as a tourist centre in the 1980s, and Lake Tahoe continues to serve as a fashionable playground.

Construction of Hoover Dam on the Colorado River substantially aided the economy of southern Nevada, and its cheap hydroelectric power opened the way for manufacturing. The importation of hydroelectric power from Bonneville Dam on the Columbia River and piped-in natural gas also has brought industrial development in the northwestern region.

In the 1950s the establishment of the Nevada Test Site by the federal government expanded employment opportunities and stimulated the development of technical industries within the state. Overshadowing the new industrialization, and fundamentally responsible for the current prosperity, is the diversification and expansion of the tourist trade to include not only the gaming and entertainment facilities of the Reno and Las Vegas areas but also the scenic and recreational opportunities statewide. (R.J.Z.)

Utah

A Mountain state, Utah became the 45th member of the Union on Jan. 4, 1896. Utah represents a unique episode in the settlement of the United States, a story of a religious group that trekked and was driven across three-quarters of the continent in search of a "promised land." The state capital, Salt Lake City, is the world headquarters of the Church of Jesus Christ of Latter-day Saints, commonly known as the Mormon church, and the spiritual home of adherents throughout the world. With Mormons making up nearly 70 percent of the state's population, the beliefs and traditions of the Mormon church continue to exert profound influences on many facets of the state's life and institutions.

Before the arrival of the first Mormon pioneers, Utah was inhabited by several Indian tribes including the Ute, for whom the state is named. From the beginning of Mormon settlement in 1847, the pioneers set about wresting a green land from the deserts, gradually supplementing their crops with the products of industry and the earth. The economy

(Margin notes:)

Discovery of mineral wealth

Advent of the resort and scientific communities

of present-day Utah is based on manufacturing, tourism, and services, in addition to agriculture and mining.

Mountains, high plateaus, and deserts form most of Utah's landscape. The state's 84,899 square miles (219,889 square kilometres) lie in the heart of the West, with Idaho to the north, Wyoming to the northeast, Colorado to the east, Arizona to the south, and Nevada to the west. At Four Corners, in the southeast, Utah meets Colorado, New Mexico, and Arizona at right angles, the only such meeting of states in the nation.

PHYSICAL AND HUMAN GEOGRAPHY

The land. *Relief.* The Colorado Plateau comprises slightly more than half of Utah. Relatively high in elevation, this region is cut by brilliantly coloured canyons. Utah's growing tourist industry relies upon the attraction of the region's fiery, intricately sculptured natural bridges, arches, and other masterpieces of erosion.

Desert and mountain landscapes

The western third of the state is part of the Great Basin of the Basin and Range Province, a broad, flat, desertlike area with occasional mountain peaks. Great Salt Lake lies in the northeastern part of the region: to the southwest of the lake is the Great Salt Lake Desert, covering some 4,000 square miles, which include the Bonneville Salt Flats, famous for land speed racing. During the Pleistocene epoch, from 1,600,000 to 10,000 years ago, the region's huge Lake Bonneville covered an area as large as Lake Michigan. Great Salt Lake, saline Sevier Lake, and Utah Lake are the remnants of Lake Bonneville.

The Middle Rockies in the northeast comprise the Uinta Mountains, the only major mountain range in the United States running in an east–west direction, and the Wasatch Range. Along the latter runs a series of valleys and plateaus known as the Wasatch Front. The Wasatch Range exhibits many glacially formed features such as cirques and moraines. Canyons have been formed by various streams.

Altitudes range from 13,528 feet (4,123 metres) at Kings Peak in the Uintas to about 2,000 feet in the southwestern corner of the state. The Oquirrh and Deep Creek ranges of the Great Basin are important for their deposits of copper, gold, lead, and zinc.

Drainage. Utah contributes to three major drainage areas—the Colorado and Columbia rivers and the Great Basin. The Colorado and its tributary, the Green, drain eastern Utah. The Upper Colorado River Storage Project includes several dams and many lakes in that area. Rivers

in the western part of the state include the Bear, Weber, Provo, Jordan, and Sevier, all of which flow into the Great Basin. All of the river systems are important for their irrigation and power potential.

Irrigation was among the first Mormon pioneer efforts in 1847, and since then irrigation and water conservation have become increasingly important. The irrigation complex in Utah comprises a number of dams, reservoirs, canals and ditches, pipelines, and flowing wells, exclusive of the large Glen Canyon and Flaming Gorge dams. State boards and departments regulate water use, while the division of health maintains quality water standards under the Water Pollution Control Act of 1953.

Irrigation and water conservation

Soils. The desert soil that covers most of the state lacks many organic materials but contains lime. Lack of adequate drainage in the Great Basin has damaged surrounding soils with saline materials and alkali salts. The richest soils are in the centre of the state, from the Idaho border almost to Arizona, where most of the farming is done. Mountain soils provide a habitat for conifers and other trees.

Climate. Utah's geographic location in relation to the mountain systems of the West, which divert much of the area's precipitation, makes it basically an arid state. Southwestern Utah, which has a warm, almost dry, subtropical climate, however, is referred to as Utah's "Dixie." The southern part of the Colorado Plateau has cool, dry winters and wet summers, with frequent thunderstorms. Northern Utah is affected by air masses from the North Pacific and continental polar air; it receives most of its precipitation in the cool season.

The state has four distinct seasons. The average temperature in July is about 70° F (21° C). In winter the average temperature is slightly below freezing except in Dixie. Daily temperatures vary widely: when Salt Lake City has July highs of 90° F (32° C) or above, the nights are 55° to 65° F (13° to 18° C). Relatively low humidity prevails; average precipitation is 11 inches (280 millimetres) a year, varying from less than eight inches annually over the Great Salt Lake Desert to 50 inches in the Wasatch Mountains. The average annual snowfall is 4½ feet, ranging from none in the southwestern valleys to more than 10 feet at ski resorts. The average growing season is 131 days.

Plant and animal life. Utah's 4,000 plant species represent six climatic zones, from the arid Lower Sonoran in the southwestern Virgin Valley to the Arctic on mountain peaks. In the south are found creosote bush, mesquite, cactus, yucca, and Joshua tree; the alkaline deserts are the habitat of shad scale, saltbush, and greasewood. Juniper and sagebrush grow in the foothills and mountain valleys, as do piñon pine, cedar, and native grasses for grazing. In the mountains grow pines, firs, aspen, and blue spruce. Timber covers more than 15,000,000 acres (6,000,000 hectares), but only about one-fourth of the forestland is commercially valuable.

Character- istic flora

The mule deer is the most common of Utah's large animals since bison, timber wolves, and grizzly bears have largely disappeared. Coyotes, bobcats, and lynx are hunted. Game birds include grouse, quail, and pheasants; golden eagles, hawks, owls, and magpies are numerous. Great Salt Lake bird refuges are the home of sea gulls, blue herons, and white pelicans. Several species of game fish are native, while others have been introduced. Reptiles and amphibians, both poisonous and nonpoisonous, are native.

Settlement patterns. About two-thirds of Utah's land is federally owned, and 7 percent is owned by the state. About 4 percent is reserved for Indian use.

The Wasatch Front, extending north–south from Ogden to Provo and including Salt Lake City, is the main area of urban and industrial development. Salt Lake City is the political, cultural, and religious capital of Utah. Historically a trade centre, it continues to be a hub for industry, commerce, and interstate transportation.

The Front has not only the largest part of the population but also the best farmland in the state. Although tens of thousands of acres of cropland have been urbanized since 1958 and an urban trend continues, a rural society is still observable. Rural settlements typically have a "Mormon village" flavour, with a readily recognizable Mormon

chapel or tabernacle within the town; wide streets, and a cultivated area surrounding the town itself.

The people.   The population is about 95 percent white, mainly of northern European ancestry. The remainder are Hispanics, Indians, Asians, blacks, and other minorities. Except for Indians, nearly 80 percent of the minority population lives in the three Wasatch Front counties of Salt Lake, Davis, and Weber.

The population of San Juan county is about one-half Indian, containing almost 30 percent of Utah's Indians. These are mostly Navajo, who reside primarily in the Four Corners region of the Navajo Indian Reservation. The Ute live on the Uintah and Ouray Indian Reservation. Annually sponsored events include the bear dance in the spring, the sun dance in July, and the Uinta Basin Industrial Fair in August or September. A number of Southern Paiutes, among the most economically depressed of the tribes, live on several small reservations in southern Utah.

People of Hispanic origin constitute the state's largest minority group. Increasing attention is being paid to the problems of educating and acculturating this group, many of whom are low-income workers in agriculture, mining, manufacturing, and services.

Although Mormons represent 90 percent of all religious adherents in Utah, Roman Catholics can be found throughout the state. Baptists, Lutherans, and other Protestant denominations are also represented.

The economy.   From 1847 to 1868 the Mormons built a self-sufficient economy based on agriculture, handicrafts, and small industry. From 1869 to 1896 this cooperative economy was supplemented by a non-Mormon enclave devoted to mining and trading. After statehood the exportable resources of the state were exploited to an increasing extent by outside corporations and enterprisers, and the agriculture of the state turned toward range cattle, wool, and such commercial crops as sugar beets. The economic depressions of 1921 and of the 1930s were severe, but federal programs and the welfare program of the Mormon church helped the state to recover. During World War II several defense plants and air bases were built, Utah had a uranium boom. In the late 1950s several large plants were erected to build rocket engines for missiles.

The state's economy is highly diversified. The agricultural and mining sectors have been supplemented by light and heavy manufacturing, finance, transportation, and tourism. Salt Lake City is a regional centre of finance and trade, and many large enterprises have offices there.

Mining.   A fair percentage of the nation's new copper is produced annually in Utah, but a decline in world copper prices in the 1980s brought Utah's copper production facilities to a standstill by 1985. Reorganization of the industry has allowed some production to continue. Utah is the world's foremost producer of beryllium, and it is a major producer of gold, silver, lead, uranium, and molybdenum. Salt (sodium chloride) was once the only mineral extracted in quantity from the Great Salt Lake, but sophisticated chemical industries now operate on the shores of the lake, using its brines to also produce magnesium, potassium sulfate, and sodium sulfate for industrial use throughout the world.

Utah is a major producer of coal west of the Mississippi, and it is the only state producing Gilsonite, a source of road oil, paving binder, and asphalt tile. In addition to steam plants, Utah has many hydroelectric plants.

Agriculture.   Following the national trend, farm employment and the number of farms in Utah have declined since 1960, but productivity has increased. Almost three-fourths of Utah's farm income comes from livestock products, the remainder from field crops, fruit, and canning crops.

Industry.   Business and military services and state and federal government employment continue to increase at a faster rate than other sectors of the economy. The proportion of personal income derived from manufacturing is below average, however. Printing and publishing, food processing, petroleum refining, and the production of transportation equipment, computer hardware and software, nonelectrical machinery, rocket engines, and fabricated-metal products are the major manufacturing sectors.

Transportation.   Utah's transportation industry, with easy access to all national markets, is the basis for the state's development as a major distribution centre for the West. Although railway mileage has decreased, road traffic has expanded; several interstate highways supplement the state system. In addition to the international airport serving Salt Lake City, there are excellent feeder line facilities in Ogden, Logan, Provo, Cedar City, and St. George.

Administration and social conditions.   *Government.* Utah's constitution, dating from statehood, guarantees basic personal freedoms consistent with the federal Bill of Rights, prohibits sectarian control of public schools, forbids "polygamous or plural marriages," and grants equal civil, political, and religious rights, including suffrage, to all citizens. Voting requirements follow national patterns, though for elections affecting tax levies a voter must have paid a property tax the previous year.

The governor is aided by a lieutenant governor (who also performs the duties of a secretary of state), auditor, treasurer, and attorney general, while much of the administration of routine state affairs is done through more than 50 state agencies. Each of these officials serves a four-year term. The governor has the right to veto any bill, but that decision may be overruled through repassage of the bill by a two-thirds majority of each house of the legislature. Any bill passed by the legislature and not acted upon by the governor within 10 days while the legislature is in session automatically becomes law. The governor, lieutenant governor, and attorney general together form the State Board of Examiners, which reviews all official state transactions.

Legislative power is vested in the Senate and House of Representatives, as well as in the voters, who have the power to initiate legislation and to hold a referendum on all laws not passed by a two-thirds majority of both houses. The legislature consists of 29 senators serving four-year terms and 75 representatives serving two-year terms.

The legislature meets annually in 45-day sessions. Special sessions may be called by the governor. Four councils provide investigation and research of specific legislative and state problems; advice on budgetary matters and appropriation requests; and legislative administration.

The highest judicial authority is the state Supreme Court, composed of five justices elected to 10-year terms, one every two years. Judges of the seven district courts are elected for six-year terms. The state also has circuit courts and justices of the peace. A juvenile court system has its own districts and judges.

All of Utah's counties are political subdivisions of the state and carry out administrative, judicial, law enforcement, financial, health, educational, and welfare functions assigned by the state and federal governments. All but one of the counties are governed by the traditional three-member commission form of government. The other, Cache County, has an elected executive with part-time council members who perform judicial and policy-making functions. Counties perform municipal-type services in unincorporated areas as citizens demand, and they perform other services demanded or requested by citizens and permitted or not prohibited by state statutes.

Forms of municipal government vary according to population. Salt Lake City, the only city with a population of more than 90,000, elects a mayor and city council. Cities between 15,000 and 90,000 elect a mayor and two commissioners, while smaller cities elect a mayor and five council members. Incorporated towns are governed by a president and four trustees. Any city commission or town council has the power to appoint a city manager.

Although Utah is referred to frequently as a Republican state, actually no party can claim dominance. Elected officials from both parties work well together and show a reasonable degree of harmony. This has been true since the early 1890s, when the normally homogeneous Mormon populace was divided into political parties by church leaders to comply with federal requirements for statehood.

Utah's broadly based tax structure appears to distribute the costs of government among all segments of the economy. The corporate income tax rate is lower than that of most Western states. A liberal free-port tax law granting tax exemptions on goods warehoused and processed in Utah is an incentive to commerce.

Education. More than half of Utah's governmental expenditure is for education. Utah has the highest proportion of its population in public schools, the highest proportion of high school graduates, and the highest median level of school years completed of any state in the nation.

The school districts levy taxes that pay for almost half of educational expenses, the remainder being paid by the state. General public school regulations are administered by the state Board of Education; elected local boards exercise more specific control. There is a growing number of private elementary and secondary schools.

Higher education   The largest of Utah's state universities is the University of Utah, in Salt Lake City. It was founded in 1850 as the University of Deseret and has a reputation for outstanding graduate and professional schools of medicine, law, and pharmacology. Utah State University, in Logan, founded in 1888 as a land-grant school, has achieved national status in the fields of agriculture, forestry, education, engineering science, upper-atmosphere research, and the fine arts. Weber State College (1889), in Ogden, and Southern Utah State College (1897), in Cedar City, are schools with rapidly expanding programs and facilities. Dixie College (1911), in St. George, and College of Eastern Utah (1938), in Price, are state junior colleges. Community colleges offering technical and other courses are located in Salt Lake City and Provo.

Brigham Young University, in Provo, is operated by the Mormon church. It is the largest church-related university in the nation, with 12 colleges and professional schools. Westminster College of Salt Lake City (1875) is operated by three Protestant denominations.

Health and welfare. The state, county, and local governments have developed programs to improve the economic and social status of minority groups.

Health, welfare, and housing services are administered by the Department of Social Services. County health services are supervised and coordinated by the state Board of Health, which also works with school boards for child health care. Outstanding hospital systems are administered by independent health organizations and by the Roman Catholic and Episcopal churches.

The state's welfare program includes comprehensive old-age assistance, unemployment insurance, worker's compensation, and other social benefits. Efforts have been made to improve and upgrade outdated labour and hazardous-occupation laws. A division of low-income housing within the Department of Community Affairs facilitates better planning and coordination in that area. The Mormon church also has an extensive welfare program.

Impact of Mormonism on the cultural milieu   *Cultural life.* Because the population of Utah is overwhelmingly Mormon, the church has a strong influence on the state's cultural life and traditions. The church is divided into "stakes," consisting of six to 10 local congregations, or "wards," of about 500 members each. Each stake has a "tabernacle," or stake centre, with one or more chapels and recreational and cultural facilities. Each ward, or occasionally two or three wards together, owns a chapel with a centre for collective worship, classrooms, a basketball court, and a dance hall. Mormon culture emphasizes closely knit family life, widespread interest in family genealogy, prohibitions against consumption of alcoholic beverages and use of tobacco, a relatively small amount of nightlife, and participation in sports and personal-development programs. Other denominations also are active in cultural areas. Particularly notable is the annual St. Marks Arts Festival, which includes music, dancing, poetry reading, drama, and other creative arts.

The Utah State Historical Society has a collection of manuscripts, publications, and photographs and publishes the *Utah Historical Quarterly,* monographs, and full-volume diaries. The National Society Daughters of Utah Pioneers, with about 1,000 branches throughout the nation, maintains a museum and monuments, preserves old landmarks, marks historical sites, keeps a library of historical matter, and collects data and relics to document the lives of the Utah pioneers. *The Western Historical Quarterly,* the official publication of the Western History Association, is published by Utah State University.

Park City and Pioneer Village in Salt Lake City are Old West towns containing original buildings and furnishings. Every county holds a fair in the autumn, highlighted by displays and competitions, concessions, and often a rodeo.

On July 24 almost all communities hold Pioneer Day, commemorating the entrance of the Mormon pioneers into the Salt Lake valley. It includes parades, fireworks, rodeos, orations, and reminders of Utah's early settlers.

The Division of Fine Arts, founded in 1899, is the oldest state arts agency in the nation. Its purpose is to promote all branches of the fine arts. It sponsors the Utah Governor's Conference on the Arts, and it allocates funds advanced to the state by federal agencies.

The most famous buildings in Utah are the many-spired Mormon Temple and the turtleback Mormon Tabernacle, both in Salt Lake City. The latter was built in the 1860s. It holds up to 8,000 people and has rare acoustical qualities that enrich the sounds of its world-famous organ with some 10,700 pipes. There are also notable Mormon temples in St. George, Manti, Provo, South Jordan, Ogden, and Logan.

Among the performing arts, music is emphasized. The Mormon Tabernacle Choir, 325 members with trained but nonprofessional voices, presents concerts and national weekly radio and television broadcasts. The Utah Symphony Orchestra, Utah Opera Company, and Salt Lake Oratorio Society are other major ensembles. The major universities have symphonies and choral groups performing in winter, as well as summer festivals and concerts.   Music, dance, and theatre

Dance companies in Utah include Ballet West, which features classical ballet, and the Repertory Dance Theatre, which features modern dance. The University of Utah Children's Dance Theatre and the Brigham Young University folk-dance troupes are well known.

Utah gained an early start in drama with the opening of the Salt Lake Theater in 1862. A replica has been constructed on the University of Utah campus, and performances are held there regularly. The Mormon church emphasizes folk drama in its youth organization; more than 2,000 wards produce at least one play a year, many of them written locally. These culminate biennially in a large drama festival in Salt Lake City. The annual Utah Shakespearean Festival is held in Cedar City.

Salt Lake City has professional basketball, hockey, and baseball teams, and auto racing on the Bonneville Salt Flats has gained international importance. The Mormon church sponsors competitive team sports involving thousands of players, with basketball, softball, and golf tournaments that are among the largest in the nation.

Utah's nine national forests and other undeveloped areas offer great tracts of land for hunting, fishing, camping, hiking, skiing, and snowmobiling. Other natural attractions include the national parks (Arches, Bryce Canyon, Capitol Reef, Zion, and Canyonlands), the national monuments (Cedar Breaks, Dinosaur, Natural Bridges, Timpanogos Cave, Rainbow Bridge, and Hovenweep), the national recreation areas (Flaming Gorge and Glen Canyon), and the Golden Spike National Historic Site. There are 45 state parks, including Pioneer Trail State Park at Salt Lake City.

HISTORY

Prehistory and white exploration. As early as 10,000 BC, small groups of hunters and gatherers lived in caves by the great inland sea, prehistoric Lake Bonneville. This desert culture was replaced about AD 400 by the more advanced Pueblo, or Anasazi, culture, which came into Utah from what is now the Southwest and Mexico. These Indians constructed superb communal cliff dwellings and raised corn (maize), squash, and beans. They left Utah about 1250, perhaps because of an extended drought.   Early inhabitants and cultures

When white explorers and settlers came to Utah in the 18th and 19th centuries, they encountered Shoshoni Indians—the Southern Paiute, Gosiute, and Ute—some of whom raised corn and pumpkins by irrigation. The Ute in eastern Utah lived in a region of higher rainfall; having acquired horses from Plains Indians, their nomadic life centred around the buffalo.

Two Franciscan fathers, Francisco Atanasio Domínguez and Silvestre Vélez de Escalante, explored Utah in 1776, and afterward Utah was visited by occasional Spanish

trading parties. Fur trappers and immigrants to California and Oregon were in the region in the 1820s and '30s. The first four of some 16 annual rendezvous between trappers and buyers were held in Utah from 1825 to 1828, indicating the early importance of the area to the fur trade. The "mountain men" who explored and established trading posts included James Bridger, who first visited the Great Salt Lake in 1824, and Jedediah Smith, who first traversed the state from north to south and west to east in 1826–27. Explorers sent by the government included John C. Frémont, who led expeditions to northern Utah in 1843 and the western Great Salt Lake area in 1845.

Mormon settlement and territorial growth. The period of settlement and territorial status is notable for the ending of the quest (1845–47) for a Mormon homeland, wrestling with an arid environment, the contest for sovereignty between Utah and the United States, and the conflict with indigenous Indians over the use of the land.

When wagonloads of Mormon pioneers under the leadership of Brigham Young first entered the valley of the Great Salt Lake in 1847, they were determined to transform the arid valley land into a green and wholesome "kingdom of God." From Salt Lake City (until 1868 called Great Salt Lake City) settlers were directed to colonize in all directions until they had developed a prosperous and stable economy and political structure in a territory that was originally 210,000 square miles in area, stretching from the Rockies to the Sierra Nevada and from the Columbia River in Oregon to the Gila in Arizona. Immigrant converts continued to stream into Utah from Europe and the eastern United States; they were organized into colonizing parties based on allocations of skills and leadership abilities and sent out to build the territory. By 1860 more than 150 self-sustaining communities with a total of 40,000 residents had been established, irrigating crops with water from mountain streams carried through canals to the alluvial valley lands. Utah's place in the national scene was symbolized by the driving of the golden spike at Promontory in 1869, uniting the eastward- and westward-reaching lines of the nation's first transcontinental railroad.

Conflict with the Indians was held to a minimum until the colonizers became more and more ubiquitous and local Indians began to raid the settlements. The Ute were eventually placed on a reservation in the Uinta Basin, the Southern Paiute and Shoshoni on smaller reservations, and later the lands south of the San Juan River were incorporated into the Navajo Reservation.

Mormons' conflicts with federal government

The propensity of the Mormons to establish their own political and social system and the incompetency of federal territorial officials led to an era of conflict with the federal government. In 1857 President James Buchanan, believing the Mormons to be in a state of open rebellion, ordered some 2,500 soldiers to Utah to replace Young, who had served as governor during the early years. This episode is referred to as the Utah War, although no armed clashes occurred. With the outbreak of the American Civil War in 1861, a new camp was established east of Salt Lake City under the command of Colonel Patrick Connor. Connor openly supported his troops in prospecting for minerals and sought to "solve the Mormon problem" by initiating a miners' rush to Utah. A substantial enclave of non-Mormon miners, freighters, bankers, and businessmen arrived, and there ensued three decades of conflict between Mormons and non-Mormons.

Before and after statehood. The Mormon settlers applied for statehood in 1849 under the name Deseret, a word from the sacred *Book of Mormon* meaning "honeybee" and signifying industry. This bid was rejected, as were the efforts of five subsequent constitutional conventions between 1856 and 1887. Before the U.S. Congress and the national administration would assent to statehood for Utah, Mormon leaders were required to discontinue the church's involvement in politics through its People's Party, withdraw from an economic policy in which Mormons dealt primarily with each other, and discontinue the practice of polygamy.

After its acceptance into the Union in 1896, Utah moved rapidly into the mainstream of the nation. The political structure changed from theocracy to a conventional democracy: non-Mormons were elected to important positions, including the office of governor. The Mormon church has been officially neutral in politics since the early 1900s, and the influence of economic blocs has become far more important. That Utah's traditional spirit of community-mindedness survives was illustrated by the thousands who joined, on short notice, to counteract the devastation of heavy spring flooding in Salt Lake City in 1983.   (L.J.A.)

Wyoming

Wyoming is the ninth largest U.S. state, with an area of 97,809 square miles (253,326 square kilometres). It was admitted to the Union as the 44th state on July 10, 1890. The state's name is derived from a Delaware Indian word meaning "land of vast plains," an apt description of Wyoming's spacious natural environment, which is home to nearly as many pronghorn as people. The state's residents are spread across the land in small ranching and farming towns, in mining settlements, and in communities offering unparalleled outdoor recreational opportunities. Each year millions of people visit Yellowstone and Grand Teton national parks. Cheyenne, the state capital, is located in Wyoming's southeastern corner.

Wyoming shares boundaries with six other Great Plains and Mountain states: South Dakota and Nebraska on the east, Colorado on the south, Utah on the southwest, Idaho on the west, and Montana on the northwest and north. Tens of thousands of pioneers crossed Wyoming along the Oregon, Overland, Mormon, Bozeman, and Bridger trails during the 19th century. The route of the short-lived Pony Express crossed the state along the Oregon Trail in 1860–61, as did the tracks of the Union Pacific Railroad when they first connected North America's east and west coasts in the late 1860s.

PHYSICAL AND HUMAN GEOGRAPHY

The land. *Relief.* Wyoming's topography is dominated by several large basins and the mountain ranges of the Rockies that border them. The broad basins are synclines, while the mountains dominating Wyoming's horizon were formed during a period of mountain-building activity known as the Laramide orogeny, which affected the region from 70,000,000 to 40,000,000 years ago. The land surface of Wyoming has a mean elevation of 6,700 feet (2,040 metres) above sea level, the highest in the United States after Colorado. Three-quarters of the state lies more than a mile (1,609 metres) high, and 40 percent exceeds 7,000 feet (2,100 metres) in elevation. Wyoming's lowest point of 3,125 feet (953 metres) lies in the channel of the Bell Fourche River as it flows from the state into South Dakota, and its highest point is Gannett Peak (13,804 feet [4,207 metres]) of the Wind River Range in west central Wyoming.

Basins and mountains

Wyoming has six physiographic regions: the Black Hills; Great Plains; Southern, Middle, and Northern Rocky Mountains; and Wyoming Basin. The Black Hills extend into the state from South Dakota and are of generally low relief. Wyoming's Great Plains region occupies the easternmost one-third of the state, gradually increasing in elevation from the state's eastern border to the many mountain ranges that mark the region's western margin.

The Southern Rocky Mountains extend from northeastern Colorado along the Laramie, Medicine Bow, and Sierra Madre ranges, making their farthest extension into Wyoming along the Laramie Range, where the mountain system terminates just south of the North Platte River near the city of Casper. The Northern Rocky Mountain region extends south from Canada across Montana and Idaho and enters Wyoming at the northwestern corner of Yellowstone Park. The much larger Middle Rocky Mountain region occupies most of the northwestern quarter of the state, extending south along the Idaho–Wyoming border into Utah. Included in this region are the scenic Big Horn and Wind River mountain ranges, the geysers and fumaroles of Yellowstone Park, the igneous Absaroka Plateau on the park's eastern margins, and Gannett Peak.

The Wyoming Basin is composed of interspersed smaller

Wyoming's Rocky Mountains

mountains and intermontane basins and is located between the Southern and Middle Rocky Mountains. This region includes Flaming Gorge, created by the Green River, and the Great Divide Basin that encloses an area of interior drainage with no outlet.

Drainage. The Continental Divide crosses Wyoming from the south central portion of the state, trending northwest and leaving the state through Yellowstone National Park. Partly because of the presence of the divide, Wyoming contributes to the headwaters of four major North American drainage systems—the Colorado, Columbia, and Missouri rivers and the Great Salt Lake. The most significant of these to the state is the Missouri system, which drains approximately three-fourths of Wyoming's land area. It is estimated that 75 percent of the state's contributions to these drainage systems originates as snowmelt in Wyoming's mountain ranges.

Soils. Wyoming's several hundred soil types may be grouped into three broad categories determined largely on the basis of the state's variable elevation and climatic zones. Varieties of mountain soils are found throughout the many ranges in Wyoming, with their greatest concentration in the northwest. These soils are frequently acidic and of limited value to commercial cropping, although they may support alpine meadows used for summer pasture and scattered forests used for timber products. The southwestern to north central portions of the state contain numerous varieties of desert soils that are frequently alkaline and used mostly for winter range, although others are suitable for agricultural crops when irrigated. Plains soils, found in the eastern third of Wyoming, are of reasonable fertility and support moderate levels of dryland farming, including the production of wheat.

Climate. Wyoming's climate is influenced by its interior location on the North American landmass (a condition termed continentality) and by its high mean elevation. The state includes areas of arid desert, semiarid steppe (short-grass prairie), and alpine climates. The arid desert regions are all found in the western half of the state and have average annual rates of precipitation of between four and eight inches (100 and 200 millimetres). More than 70 percent of the state is considered semiarid steppe and averages nine to 16 inches (230 to 410 millimetres) annually. Wyoming's mountains may receive much larger quantities of precipitation. In some mountainous areas total snowfall can exceed 200 inches (5,100 millimetres) annually and remain on the ground more than 150 days per year.

Average monthly temperatures vary greatly across Wyoming. January mean temperatures range from a low of 10° F (−12° C) in the mountains to 28° F (−2° C) in the southeast. Mean July temperatures range from 50° F (10° C) in the mountains to 75° F (24° C) in the Big Horn Basin in north central Wyoming.

Plant and animal life. Approximately 80 percent of Wyoming is covered with grasses and semidesert to desert shrubs. The state's forests are found largely in the mountains and along streams where sufficient soil moisture is available. Though there are some limited areas of hardwood trees, most of Wyoming's forests are composed of conifers, principally ponderosa pine in the northeast, lodgepole pine in the south central area, and Douglas fir, Engelmann spruce, and lodgepole pine in the northwest.

Wyoming supports abundant animal life, including the

Pronghorn largest number of pronghorn found anywhere. Pronghorn are located in every part of the state, with their greatest concentration in areas of sagebrush and grasses. The state also supports large numbers of whitetail and mule deer and lesser populations of wapiti (American elk) and moose. Black bears live in most of Wyoming's forested mountain areas, with grizzly bears in the high mountain and wilderness areas in and surrounding Yellowstone Park. Herds of American bison (buffalo) are found in Yellowstone and Grand Teton national parks. Grouse, quail, partridge, and pheasant are found in some of the state's uplands, and wild turkeys are common in many of the state's open woodlands.

Settlement patterns. Wyoming's earliest pattern of sedentary occupancy by Europeans was determined by the locations of military posts such as Fort Laramie (1834–90)

and Fort Bridger (1843–90). The building of the Union Pacific Railroad in the late 1860s led to the founding of several early settlements, including Cheyenne, Laramie, Rawlins, Rock Springs, and Evanston.

Wyoming's current pattern of settlement is based upon its agricultural, mining, and recreational activities. There is no major metropolitan area, and the state's two largest urban areas, Casper and Cheyenne, are small cities by the standards of most states. The remainder of the state's towns and cities are typically small in population, having long expanses of Wyoming's wide open spaces between them. They are service centres for surrounding ranches and farms, mining operations, and recreational lands.

The people. More than 95 percent of Wyoming's residents are Caucasian. Although most of the state's Caucasian residents trace their roots directly to Europe, Mexican-Americans now account for about 5 percent of Wyoming's population. Blacks constitute less than 1 percent of the total population, most living in the Cheyenne area. Although Chinese immigrants were instrumental in the construction of the Union Pacific Railroad, Wyoming's Asian population today is small and numbers fewer than 2,000. Most Asians live in the state's southern counties in the cities of Cheyenne, Laramie, and Rock Springs. Nearly 2 percent of Wyoming's population is composed of American Indians, mostly of the Arapaho and Shoshoni tribes. More than half of the Indian population lives on the 3,500-square-mile (9,065-square-kilometre) Wind River Reservation in the west central portion of Wyoming.

The economy. Wyoming's economy is heavily tied to mining and agriculture (primarily the marketing of beef cattle and sheep). The state also has an important and growing tourist industry, serving the hundreds of thousands of visitors to the state's parks and historic sites. Manufacturing is of only minor importance.

Mining. Wyoming is one of the top coal-producing states. Coal ranked as Wyoming's most valuable mineral resource prior to 1920 but is now third behind the state's oil and natural gas reserves. Of the oil and gas deposits found across the state, the largest known deposits are those in the northeast. There are also significant oil shale reserves in the southwest.

Wyoming has substantial uranium deposits, estimated to account for one-third of the total reserves in the United States. The state's largest uranium deposits are found in the Red Desert, Shirley Basin, South Powder River basin, Gas Hills, and Pumpkin Buttes areas. Wyoming also contains quantities of trona (unrefined soda ash), bentonite clay (used as drilling mud), gypsum, limestone, and iron ore. Because of a rise in gold prices in the mid-1980s, gold exploration has increased in Wyoming, especially in the southern tip of the Wind River Range.

Uranium and other ores

Agriculture. As Wyoming's nickname, the Cowboy State, implies, ranching has historically been important to the state both economically and culturally. The state's rangelands are well suited to livestock production, and approximately 70 percent of the state's land area is devoted to livestock grazing. Wyoming is responsible for the production of much of the sheep, lambs, and beef cattle in the United States. The principal breed of sheep is Rambouillet; the principal breeds of cattle are Angus and Hereford.

The major crop-producing areas in Wyoming are in the southeast and in the Big Horn and Wind River basins. Wyoming's most valuable grain crop is wheat; other important crops include oats, barley, hay, and corn (maize). Wyoming is a major producer of sugar beets, dry beans (including great northern and pinto beans), and potatoes.

Tourism. Tourism and recreation are major growth industries in Wyoming. They make a substantial contribution to the state's economy and account for approximately 10 percent of the total employment. The state government has increased its advertising of Wyoming's spectacular scenery and recreational opportunities. Among the principal sites for tourists are the state's parks and historic sites, Yellowstone and Grand Teton national parks and such attractions as Big Horn Canyon National Recreation Area, Fort Laramie National Historic Site, and Devil's Tower and Fossil Buttes national monuments.

Transportation. The original path of the transcontinental railroad still serves as one of Wyoming's major transportation corridors. The tracks of the Union Pacific Railroad, which continue to carry substantial quantities of freight across the state, now share the corridor with Interstate 80, one of the country's most important east–west highways. A second east–west transportation corridor is Interstate 90. Wyoming's primary north–south transportation corridor is Interstate 25. The state is served by a network of paved highways and roads that include the scenic Yellowstone Highway, which connects Wyoming's largest city, Casper, with Yellowstone National Park.

There is no passenger rail service in Wyoming, but commuter air carriers serve the state's major cities and recreational destinations, such as Cheyenne, Laramie, Casper, Cody, and Jackson Hole. Most commuter air service operations originate in Denver, Colo., or Salt Lake City, Utah. Additional flights are scheduled during the winter to serve skiing destinations such as Jackson Hole.

Administration and social conditions. *Government.* Wyoming's constitution, adopted in 1889, specifies three branches of state government: a legislature, an executive, and a judiciary. There are five elected executives—the governor, auditor, treasurer, superintendent of public instruction, and secretary of state; there is no lieutenant governor. All executive officers serve four-year terms. Each of the five elected state administrators supervises an area of state government with a substantial degree of autonomy.

Wyoming's constitution specifies a bicameral legislature, including a House of Representatives and a Senate. The Senate has 30 members who are elected for four-year terms, while the House has 64 representatives who are elected every two years. Representation in both chambers is based upon county or district populations. Wyoming's legislature is composed of part-time citizen lawmakers who meet for limited legislative sessions each year.

Wyoming's constitution also establishes a three-tier court system that includes local courts, nine district courts, and a Supreme Court. District court justices stand for reelection every six years. The state's Supreme Court has five justices who stand for reelection every eight years in nonpartisan elections. Local courts include country courts and justices of the peace and municipal courts.

At the local government level there are 23 counties and numerous municipalities, school districts, and special districts. The form of municipal government is by local option, the strong and weak mayor and the manager forms all being used. All counties use the commission form of government. The average county government provides services to a sparse population spread over 4,226 square miles, an area more than twice as large as the state of Delaware. Sweetwater county, in the southern portion of the state, alone accounts for 10,429 square miles. These large areas require a strong commitment to the effective provision of services on the part of local government officials and a measure of self-reliance on the part of Wyoming's population.

Wyoming is politically conservative and has traditionally favoured the Republican Party in presidential contests. Wyoming has also sent a greater number of Republican senators and representatives to the U.S. Congress. Although Democratic victories are not uncommon in state executive-branch positions, there has not been a Democratic majority in the state Senate since 1936 or in the House since 1964.

Education. Compared with national averages, Wyoming's schools are small and have favourable teacher–pupil ratios. In the state's most isolated areas, kindergarten to eighth-grade students are still taught in one-teacher schools.

The University of Wyoming, located in Laramie, was founded in 1886 and is the state's only public four-year institution of higher learning. The university offers undergraduate study in more than 100 fields and has a variety of graduate degree programs. Wyoming also maintains two-year community colleges in Casper, Cheyenne, Sheridan, Powell, Rock Springs, Torrington, and Riverton.

Health and welfare. Wyoming has unparalleled outdoor recreational opportunities, a low rate of crime, and little pollution. The state's population is well educated, with a proportion of both high school and college graduates above the national average. Personal income per capita in Wyoming is variable because of the state's dependence on mineral extraction but generally is among the highest in the Rocky Mountain region. Quality health-care facilities are located in the state's larger towns and cities, but there remains a demand for resident health-care professionals in many of the state's rural areas.

Cultural life. Western traditions and culture remain very much a part of Wyoming life. Annual festivals that celebrate the state's Western heritage include county fairs, the Wyoming State Fair, held in Douglas each August, and Jubilee Days, held in Laramie in July. Many of these events are held in conjunction with rodeos. The world's largest rodeo is held each summer in Cheyenne during Frontier Days. Frontier Days has been held annually since 1897 and draws visitors from all parts of the world to watch events such as bronc riding, bull riding, calf roping, and barrel racing.

Music companies and music festivals include the Cheyenne Symphony Orchestra, Casper Civic Symphony, Grand Teton Music Festival in Teton Village, and the Wyoming Summer Music Festival in Laramie, which highlights chamber music. Several cities and towns in Wyoming have active theatre companies. There are also a number of museums in Wyoming, many preserving the state's colourful historical past. Every county in Wyoming has at least one library, with the state's largest being the William Robertson Coe Library, at the University of Wyoming in Laramie.

Wyoming's numerous state and national parks provide nearly unparalleled opportunities for camping, hiking, and observing wildlife. Nearly the entire expanse of the world's oldest national park, Yellowstone, is found within the borders of Wyoming, making it readily accessible to the state's residents. A large number of Wyomingites also regularly take advantage of the state's excellent hunting and fishing opportunities.

HISTORY

Prehistory to white exploration. The first occupants of Wyoming were Paleo-Indian hunters and gatherers who arrived from Siberia through Alaska more than 20,000 years ago. The total number of these peoples was never large because they were highly dependent upon local game populations. By the time the first well-documented visits

© James Fain

Calf roping at the Cody Stampede, a rodeo held annually in Cody, Wyo.

by white men to Wyoming occurred, the state's population likely did not exceed 10,000. The Shoshoni were the largest tribal group in Wyoming around 1800, but there were also smaller numbers of Arapaho, Crow, Cheyenne, and Oglala and Brulé Dakota (Sioux).

First
European
visitors

The first known white men to enter Wyoming were the French-Canadian brothers Francois and Louis-Joseph, sons of Pierre Gaultier de Varennes, Lord de La Vérendrye. The brothers visited the northeastern corner of the state in 1743 while unsuccessfully searching for a route to the Pacific Ocean. Although the Lewis and Clark Expedition (1804–06) missed Wyoming by 60 miles, a member of the group, John Colter, broke away from the main party and trapped in northern Wyoming for some time; the official journal of the expedition includes Colter's route and descriptions of the Jackson Hole and Yellowstone Park areas.

Fur trade and the Union Pacific Railroad. The early explorers were followed later by small numbers of fur traders. Although there were likely never more than 500 of these mountain men in Wyoming at any given time, the state's economy between 1825 and 1840 was heavily dependent on the activities of such famous trappers and traders as Jim Bridger, William Sublette, Jedediah Smith, and Thomas Fitzpatrick.

The number of people entering the Wyoming area increased with the westward movement of the American population. As many as 400,000 emigrants crossed Wyoming between 1841 and 1868 on the trails leading to what is now Oregon, Washington, Montana, Utah, and California. In 1850 alone it is estimated that as many as 55,000 crossed the future state. Pony Express riders, including Buffalo Bill Cody, carried the mail across Wyoming between April 1860 and October 1861.

In November 1867 the first train of the Union Pacific Railroad reached Cheyenne and opened Wyoming as never before. Cheyenne grew from a handful of people to more than 6,000 in the first year, though the town consisted largely of tents and shacks with a limited number of commercial buildings. This rapid population growth continued in southern Wyoming as the Union Pacific tracks continued across the state, finally entering Utah in 1868. The building of the railroad focused attention on the West, and the Wyoming Territory was created on July 25, 1868.

The state. The state's constitution was approved by a vote of the territorial population on Nov. 5, 1889, although Wyoming was not admitted to the Union until 1890. Wyoming's constitution was the first in the world to grant full voting rights to women. Wyoming was also the first state to elect a woman governor when Nellie Tayloe Ross won the position in 1924. Because of these developments Wyoming has been called the Equality State.

In the years preceding statehood Wyoming developed its thriving cattle industry. The state's immense rangelands fostered the initiation of the cowboy era that was chronicled in Owen Wister's *The Virginian* (1902), based on his experience in turn-of-the-century Wyoming. Although frequently exaggerated by Hollywood, this era was marked by violence on the range between cattlemen, homesteaders, and sheepherders that continued well after 1900.

Development of the cattle industry

Although Wyoming retains its Western heritage and personality, employment in the state is now more characterized by mining than by the cowboy life. The state's reliance on the energy industries of coal, oil, natural gas, and uranium has made Wyoming subject to "boom-and-bust" cycles that depend on world prices for its products. During the energy boom of the 1970s, for example, the state's population grew at nearly four times the national rate and had one of the highest incomes per capita in the country. The world oil supply glut of the 1980s, on the other hand, caused a substantial downturn in the state's economy that led to significant population out-migration. The state is making an effort to diversify its economy in such areas as tourism, but there is little doubt that Wyoming's long-term economic future is tied to mining.   (G.R.We.)

THE PACIFIC COAST

Alaska

When it became the 49th state of the United States on Jan. 3, 1959, Alaska increased the nation's size by nearly 20 percent. The new area included vast stretches of unexplored land and untapped resources. When Secretary of State William H. Seward negotiated its purchase from Russia in 1867, however, Alaska was known as Seward's Folly. Its settlement and exploitation have been hindered by its distance from the rest of the nation and by geographic and climatic impediments to travel and communications; Alaska continues to be the country's last frontier. More than half of the state's inhabitants live in the Greater Anchorage area. The capital is Juneau, 573 miles (922 kilometres) to the southeast in the panhandle region.

Alaska lies at the extreme northwest of the North American continent and is the largest peninsula in the Western Hemisphere. Its 591,004 square miles (1,530,700 square kilometres) include some 15,000 square miles of fjords and inlets, and its three faces to the sea have about 34,-000 miles (54,400 kilometres) of indented tidal coastline and 6,600 total miles of coast fronting the open sea. It borders the Arctic Ocean on the north and northwest, the Bering Strait and the Bering Sea on the west, and the Pacific Ocean and Gulf of Alaska on the south. The land boundaries on the east cut across some 1,150 miles of high mountains to separate the state from the Canadian Yukon Territory and British Columbia province. Rimming the state on the south is one of the Earth's most active earthquake belts. In the Alaska Range north of Anchorage, Mount McKinley, at 20,320 feet (6,194 metres), is the highest peak in North America.

The question of development versus preservation has been heightened by commercial and ecological uses of land: the Alaska Highway gas-pipeline project, native Alaskans' land claims, noncommercial whaling by native peoples, and related matters. The conflicts between conservationists and petroleum companies over the Trans-Alaska Pipeline, which runs from the oil-rich North Slope on the Arctic Ocean to Valdez in the south, was a continuation of the century-long effort to find a balance between conservation and development in this enormous land.

PHYSICAL AND HUMAN GEOGRAPHY

The land. The immense area of Alaska has a great variety of physical characteristics. Nearly one-third of the state lies within the Arctic Circle and has perennially frozen ground (permafrost) and treeless tundra. The southern coast and the panhandle at sea level are fully temperate regions. In these latter and in the adjoining Canadian areas, however, lies the world's largest expanse of glacial ice outside Greenland and Antarctica. Off the extreme western end of the Seward Peninsula, Little Diomede Island, part of Alaska, lies in the Bering Strait only 2.5 miles (four kilometres) from Soviet-owned Big Diomede Island; both countries have shown a tacit tolerance of unintentional airspace violations, which are common in bad weather.

Relief. Alaska is composed of nine distinct physiographic and environmental regions. Much of the mainland panhandle region, a narrow strip of land 25 to 50 miles wide lying east and south of the St. Elias Mountains, is composed of the Boundary Ranges. There are several large icefields, and the peaks include Mount St. Elias (18,-009 feet), from whose summit the Alaska–Yukon border swings due north. The western extension of this mountain chain is the Chugach Range, a giant arc at the northernmost edge of the Gulf of Alaska. Many remote valleys and high ridges are still unexplored, and the relief and glaciation inhibit exploitation. The coast is characterized by frequent and intense oceanic storm systems that have produced dense rain forests on the coastal mountain flanks. In the valleys rivers produce devastating annual floods often associated with excessive snowmelt and glacial meltwaters.

The panhandle region

The region of the south coastal archipelago and the Gulf

Alaska Range seen from across the Tanana River.
E. Cooper—H Armstrong Roberts

of Alaska islands includes the Alexander Archipelago in the panhandle region, with 11,000 islands, plus Kodiak Island and its satellites south of Cook Inlet. These islands, extensions of the southern regions, are lower, less rugged, and less glaciated. All receive heavy rain and are affected by waters warmed by the Kuroshio Current.

The Aleutian region includes the narrow Alaska Peninsula, which forms the south shoreline of Bristol Bay, and the 1,100-mile-long Aleutian chain that separates the North Pacific from the Bering Sea. The chain includes 14 large islands, 55 significant but smaller ones, and thousands of islets. The largest are Unimak, Unalaska, and Umnak. On the occasionally clear summer days, active volcanoes and such glacier-covered peaks as symmetrical Shishaldin Volcano (9,372 feet [2,857 metres]) on Unimak can be seen. Such magnificent views represent the Aleutians at their scenic best. Usually, however, the weather is wet and stormy, the winds horizontal and cutting, and the fog all-pervading.

The broad Alaska Range region connects the Aleutian Range across the southern third of mainland Alaska to the Wrangell Mountains, which abut against the vast complex of the St. Elias Mountains. The Wrangell Mountains have large active volcanoes and high valley glaciers. The flanks of this subarctic range are largely tundra-covered.

The low-lying interior basin region between the Alaska Range in the north and the Chugach–Wrangell–St. Elias mountains to the south and east enjoys a relatively temperate climate. The lower valleys contain good farmlands, and it is there that most of the people of Alaska live.

The central plains and tablelands of interior Alaska constitute a vast region west and north of the Alaska Range; they reach as far north as the Brooks Range. The area is rolling and dissected by numerous streams tributary to the Yukon and Kuskokwim rivers. The plains extend from the Canadian border to Norton Sound, the Seward Peninsula, the Yukon delta, and south to the northern rim of Bristol Bay on the Bering Sea. The region is characterized by river flats and truncated upland tablelands. With abundant game, it is an important nesting ground for waterfowl, including great numbers of migrating birds.

A major mountain chain running west to east in the area **Brooks** north of the central plains and extending from the sea **Range** nearly to the Yukon border, the Brooks Range gradually slopes northward to a narrow linear coastal plain bordering the Arctic Ocean and westward to lower hills north

of Kotzebue Sound. There are a few high Arctic glaciers, and the area is semiarid. The lower flanks and valleys are tundra-covered, with permafrost features.

The coastal lowland north of the Brooks Range, sometimes called the North Slope, is the home of great herds of caribou. The environment is truly polar, with the sea waters along the coast frozen eight months of the year and the ground permanently frozen except for a thin zone of summer melting. It is treeless, and, in summer, grasses and Arctic alpine flowers abound. The National Petroleum Reserve-Alaska is located in the western sector, while the Prudhoe Bay oil fields and part of the Arctic National Wildlife Refuge occupy the eastern sector.

The islands of the Bering Sea represent a small but unique Arctic maritime environment, typified by St. Lawrence, Nunivak, and St. Matthew islands and the Pribilof group. These tundra-covered islands are surrounded by sea ice in winter and serve as protected refuges for the world's largest herds of fur-bearing seals and sea otters, as well as sea lions and walrus. A large herd of domesticated reindeer is tended by Eskimos on Nunivak Island.

Climates. Five general climatic zones may be delineated in Alaska, excluding the great mountain ranges.

Southern coastal and southeastern Alaska, the Gulf of Alaska islands, and the Aleutians have average temperature ranges in the summer of 40° to 60° F (4° to 16° C) and in the winter of 40° to 20° F (4° to −7° C). Rainfall varies locally from 60 to 160 inches (1,525 to 4,065 millimetres), and the panhandle and southern islands are covered with Sitka spruce, hemlock, and other evergreens. The Cordova–Valdez region and parts of the west central panhandle have the state's highest precipitation, 220 inches or more. At Valdez 200 inches of snow is not uncommon. Precipitation is less in the Aleutians, but even there about 250 rainy days occur annually.

The interior basin ranges from 45° to 75° F (7° to 24° C) in summer and 20° to −10° F (−7° to −23° C) in winter. The region is drier than the coast and only slightly colder in winter, with Anchorage receiving about 15 inches (380 millimetres) of precipitation annually. The pleasant conditions and proximity to the sea have helped to make the area the centre of the state's population.

The islands and coast of the Bering Sea have summer temperatures of 40° to 60° F (4° to 16° C) and winter temperatures of 20° to −10° F (−7° to −23° C). Tempering influences of the Pacific dissipate north of the Pribilof Islands, and Arctic sea ice often reaches this area.

The central plains and uplands range from 45° to 75° F (7° to 24° C) in the summer and −10° to −30° F (−23° to −34° C) in the winter. Average rainfall is 10 to 20 inches, though less than 10 inches is common.

The ameliorating effects of the Arctic Ocean keep temperatures of the North Slope at 35° to 55° F (2° to 13° C) in the summer and −5° to −20° F (−21° to −29° C) in the winter—less severe than those of the interior plains. About five inches of precipitation nonetheless remain on the ground as snow for some eight months of the year. The 24-hour sunlight of summer can produce strong buildups of radiant energy, sending temperatures to 90° F (32° C). The deep chill of winter, however, maintains the permafrost character of the High Arctic zone. Ice clogs the northern coast nine months of the year, while ice fog frequently extends southward to Fairbanks.

Settlement patterns. A large percentage of Alaskans live in the southern interior basins around Anchorage; most of **Population** the remainder live in the interior plains around Fairbanks **distribution** or in the panhandle region, where Juneau is the major city and the administrative centre of the state. Tiny pockets of people are scattered in small villages, the most sparsely occupied being the Arctic plains, the Bering shores, and the Aleutians. Many frontier conditions persist: a male-to-female ratio of 5 to 1 in 1910 has been reduced to near equality, but in many places bars are as numerous as churches.

The people. English, Russian, Spanish, and French place-names reflect early European exploration, but equally prominent are dozens of names from the pre-Western era. The name Alaska itself is derived from the Aleut *alaska* and the Eskimo *älakshak,* both meaning "mainland."

Long before Bering's voyages the Tlingit Indians lived in the southern and southeastern coastal area; the Aleuts on the Aleutian Islands and the Alaska Peninsula; and the Eskimos on the Bering shore and the Arctic Ocean coast. The interior natives were the Tinneh Indians, whose language was Athabascan, that of the Plains Indians of the interior continent to the south. The Indian groups are presumably descendants of the earliest immigrants across the Bering Land Bridge from Asia, perhaps more than 15,000 years ago, and they reflect the migratory wave that reached as far as the southern extremity of South America as early as 10,000 years ago. Eskimos and Aleuts appear to be much later immigrants, having arrived, probably in boats made of animal skins, perhaps 8,000 to 3,000 years ago. All groups have been involved in the debates and adjudications over public land grants.

The first wave of immigration from the "South 48"— which occurred in the decade before World War 1 as an aftermath of the gold rush—was a response to Alaska's initial concentration on its mineral, fish, and timber resources. The discovery of oil fields and the emergence of Alaska as an international air crossroads added impetus to the influx of the 1940s and '50s and construction of the Trans-Alaska Pipeline to that of the 1960s and '70s. By 1980 only about 20 percent of the white population of the state was born in Alaska.

Of the current population about one-seventh are Eskimos, Aleuts, and Indians. The remaining citizenry include military personnel and their families and a melting pot of mixed American, Russian, Filipino, Japanese, Chinese, and other nationalities.

The economy. The Alaskan economy is conditioned strongly by the state's frontier stage of development, but its formerly inadequate tax base for state and municipal growth ended with the development of the North Slope oil fields. High costs of labour and transportation and complicated environmental and land-use constraints still tend to discourage outside investment. Nonetheless, development of the state's natural resources has assisted markedly in the transition from a federal military to a commercial self-supporting economic base.

Government. Alaska's economy has been dominated by government since territorial days. From 1940 to 1960 the federal government invested nearly $2,000,000,000 in the development of military bases in Alaska. Nothing else in Alaska's history has produced such long-term results, bringing thousands of residents into the territory and creating jobs and a vast array of transportation and communications facilities extending to remote corners of the state. Combined with state and local government, the defense installations continue to add much to Alaska's economy.

Agriculture. Only a small sector of Alaska's economy is agricultural, but a viable in-state market is still under development. More than 3,000,000 acres (1,200,000 hectares) of tillable land are available for farming, but much clearing has yet to be done. Most acreage is near Anchorage and on the Kenai Peninsula, though there is some near Fairbanks, and stock ranching is practiced on Kodiak and Unimak islands. As a result, all farm products are sold locally and most foods must be imported, tremendously increasing the cost of living. Closure of the Homestead Act, ending settlement of the native land claims issue, has further curtailed development of new land. In spite of a short growing season, the long hours of summer sunlight are adapted to the production of oats, barley, potatoes, hay, and cool-climate vegetables. Livestock and greenhouse crops are also successful.

Fishing, forestry, and furs. Alaska's most constant source of revenue is derived from fishing. Fish are found mostly in waters off the southern coasts, salmon being of especial importance. The centre of the world's salmon-packing industry is at Ketchikan, on Kodiak Island, and at Bristol Bay ports in the southern Bering Sea. Fleets also bring in quantities of herring, cod, pollack, and halibut, as well as Dungeness, king, and Tanner crabs. International fishing of Alaska's waters is regulated by the 200-mile-wide exclusive economic zone and the U.S.-Canadian Pacific Salmon Treaty (1985), which assigns ownership of fish to the country in which they spawn.

Most of Alaska's timber resources are in the Tongass and Chugach national forests, in the panhandle and on the southern coast, respectively. Timber is produced mainly for export to Asia, with the pulp of Ketchikan and Sitka exported to Japan.

Pribilof sealskins represent more than half of the state's annual fur production. Other furs, largely from controlled farms, are processed as well. The production of reindeer hides from a herd on Nunivak Island is managed by the Alaska Native Association.

Power. Alaska's immense waterpower reserve is virtually untapped. The largest project is at Lake Eklutna, near Anchorage. A hydroelectric development near Juneau delivers power to the panhandle area, and another project on the Kenai Peninsula is planned to deliver power to the central and southern regions. Most other communities depend on diesel and coal plants to produce much of the required municipal power.

Mining. Petroleum was first extracted and refined between 1917 and 1933, but the development of the Kenai oil field in 1961 made the petroleum and natural gas industry Alaska's most important mineral production. Oil seeps were known as early as the 1880s in the North Slope region, which today has become a field of major economic importance to both the state and the nation. Alaska ranks second only to Texas in oil production.

Since 1880 hard-rock ore minerals have been mined in Alaska, about 95 percent of which yield gold, copper, zinc, and silver. Prospecting continues, with modern scientific technology and aerial exploration. The areas of maximum mineral potential lie in the panhandle, the Chugach and Alaska ranges, and the Seward Peninsula at locations unlimited by environmental regulation.

Alaska's gold production declined drastically after World War II, but the mining of gold especially and of zinc, silver, and lead began to rebound in the 1980s. Copper mining as a major industry ended with the closing of the Kennecott Mine in 1938, although there are new prospects elsewhere. Coal has remained an important industry. Another important activity is the extraction of sand, gravel, and clay to serve the construction industry.

Tourism. Alaska has had an upsurge of tourism. Travelers arrive mainly by air or sea and can now cover large areas by airplane and road. The influx is partly the result of the 500-passenger, 100-car ferries that operate as the Alaska Marine Highway. One ferry system connects Kodiak with mainland Seward and the Alaska Railroad, another links Cordova and Valdez, and a third serves panhandle communities from Ketchikan to Skagway, with service also from Prince Rupert, British Columbia, and Seattle, Wash.

Transportation. High costs of transportation continue to sap Alaska's economic development, largely because the major transportation links, both internal and external, are by air, which provides the fastest way to cross Alaska's great distances and formidable terrain. Two dozen airlines serve Alaska, with daily service for passengers and cargo from the South 48 and Canada, Europe, Hawaii, Korea, and Japan. Some 800 airfields, seaplane bases, and emergency strips are in use, and few villages are without service at least by bush pilots. Most of the state's roads are surfaced. The Alaska Highway and its Haines and Skagway cutoffs connect Alaska's internal road network to the outside and provide relatively easy access for tourists. A 416-mile (669-kilometre) haul road from Fairbanks to Prudhoe Bay connects with the existing highway system to provide an overland route from the ice-free southern ports to the Arctic Ocean. The public, however, is restricted to the southern half of this highway and may use it only in the summer.

The government-owned Alaska Railroad runs for about 500 miles (800 kilometres), linking Seward, Anchorage, and Fairbanks. Ocean shipping connects Seattle, Vancouver, and the trans-Canada railhead of Prince Rupert to towns in the panhandle and westward to Cordova, Valdez, Seward, and Kodiak. Ocean vessels also run during the ice-free midsummer months to Nome and Barrow and to the oil regions of the Arctic coast. A natural gas pipeline connects the Kenai gas fields and Anchorage, and the

Transportation networks

Trans-Alaska Pipeline delivers North Slope oil to ice-free tanker terminals at Valdez.

In the mid-1950s the Alaska Communication Cable was installed between Seattle and Alaska. Radio telephones connect all interior communities.

Administration and social conditions.   *Government.* The state constitution was adopted in 1956. The governor and lieutenant governor are the only executive officers and are elected for four-year terms. The 40-member House of Representatives and 20-member Senate are elected for terms of two and four years, respectively. The Supreme Court has a chief justice and four associate justices. A three-member court of appeals was established in 1980. There are four district courts. A single federal district court sits alternately in Juneau, Anchorage, Fairbanks, and Nome.

Public financing is implemented through various personal income, property, sales, and business taxes, including petroleum-based severance taxes and mining rents and royalties. As a part of the Act of Admission, Congress granted Alaska certain revenues from the sale of furs and of federal lands.

State and borough governments have difficulty in providing the usual range of services because of the limited extent of the economy and a high unemployment rate. The vast area and the difficult terrain increase these problems.

Native welfare

The U.S. Bureau of Indian Affairs (BIA) assists Alaska's natives in achieving economic and social self-sufficiency. Despite a number of helpful programs, many of Alaska's natives suffer from unemployment, low income, and poverty. The native peoples were educated first by missionary groups, though by the time of statehood the BIA had assumed most of the responsibility for education. Funds are provided for vocational training and the development of job opportunities and for welfare, social work, and medical and health needs. The BIA also assists natives in organizing their villages under federal and state laws. Some oil revenues from native lands have been applied in self-help programs. Settlement of the native land claims in 1971 improved their economic plight by placing 44,000,-000 acres of federal land into the native entitlement.

Education.   Education is compulsory through the eighth grade or until age 16 and is administered by a state board and a commissioner of education. Correspondence study is available for high school work through the State Department of Education. There are several federal schools on military bases. The University of Alaska, founded as a land-grant institution in 1917, operates campuses at Fairbanks, Anchorage, and Juneau. There are several community colleges, including those at Sitka, Ketchikan, Kenai, and Valdez. Alaska Pacific University in Anchorage, Alaska Bible College in Glennallen, and Sheldon Jackson College in Sitka are private institutions.

Health and welfare.   The elderly, dependent children, and the blind are aided by the state, and a special fund benefits sick and disabled fishermen. The state operates a psychiatric hospital, a tuberculosis treatment centre, a youth camp, and a prison.

Medical and health clinics and hospitals available to the general public are provided by municipal and borough governments or private agencies, or are run as church-operated facilities. Health standards have been raised markedly since 1950 through visits by U.S. Public Health Service nurses and doctors to the remote villages. The large number of airfields, the radio communications network, and the extensive use of bush pilots operating throughout the state make it possible for most persons, even in the remote villages, to reach medical facilities when there is serious need. There are modern hospitals located in Fairbanks, Anchorage, Juneau, and Ketchikan.

Cultural life.   Alaska's past, including the arts and crafts of its native peoples, is a major influence in Alaskan culture. Juneau is the site of the state's historical library and state museum. The university has a large museum, as do other communities, including Sitka, Haines, Valdez, and Nome. Eminent Alaskan artists have included both whites and Eskimos. Native ivory and wood carvings are well known, and the nearly lost art of totem carving has been revived in part through private and public stimulus.

Wildlife refuges and ranges abound throughout Alaska,

with more than 77,000,000 acres managed by the U.S. Fish and Wildlife Service. The federal Bureau of Land Management also holds about 25,000,000 acres for waterpower development.

In 1980, more than 104,000,000 acres were designated for national parks, preserves, wildlife refuges, and wilderness areas, adding to the 7,500,000 already so established. The Alaskan national parks are notably spectacular. Denali (formerly Mount McKinley) National Park and Preserve (1917) has an abundance of wildlife, including brown and grizzly bears, caribou, and moose. Katmai National Park and Preserve (1918), on the ʹAlaska Peninsula, includes the Valley of Ten Thousand Smokes, an area of active volcanoes that in 1912 produced one of the world's most violent eruptions. Glacier Bay National Park and Preserve (1925) has magnificent fjords, as well as glaciers that have retreated extensively in the 20th century. Sitka National Historic Park (1910), with a large totem pole collection, commemorates the stand of the Tlingits against early Russian settlers. The Tongass and Chugach national forests in the southeast and south central regions, respectively, are also federal public land reserves. The U.S. Department of the Interior has continued to study the need for withdrawing further regions from public domain into reserves.

National parks and wilderness preserves

The sporting industry, including guide and outfitter services and boat charters, continues to be a colourful activity. Alaska provides the nation's only significant Arctic wilderness, and much research is done in glacier, mountain, tundra, atmospheric, ionospheric, and polar oceanography fields by federal, state, university, and private agencies. For example, the University of Alaska carries out extensive research on Arctic problems through its Geophysical Institute, Institute of Marine Science, Institute of Arctic Biology, and other groups. Since 1946 the Juneau affiliate of the Foundation for Glacier and Environmental Research, in cooperation with the National Science Foundation, the University of Idaho, and the University of Alaska, has sponsored a glaciologic and environmental research and field sciences training program on the Juneau Icefield.

HISTORY

Explorations.   As early as 1700, native peoples of Siberia reported the existence of a huge piece of land lying due east. An expedition appointed by the Russian tsar and led by a Danish mariner, Vitus Bering, in 1728 determined that the new land was not linked to the Russian mainland, but because of fog it failed to locate North America. On Bering's second voyage, in 1741, the peak of Mount St. Elias was sighted, and men were sent ashore. Sea otter furs taken back to Russia opened a rich fur commerce between Europe, Asia, and the North American Pacific Coast during the ensuing century.

Russian pioneering

Early settlement.   The first European settlement was established in 1784 by Russians at Three Saints Bay, near present-day Kodiak. It served as Alaska's capital until 1806, when the Russian-American Company, organized in 1799 under charter from the emperor Paul I, moved its headquarters to richer sea otter grounds in the Alexander Archipelago at Sitka. The company governed Alaska until its purchase by the United States in 1867. Alaska's first governor (then termed chief manager), Aleksandr Baranov, was an aggressive administrator whose severe treatment of the native Indians and Eskimos led in 1802 to a massacre at Sitka.

A period of bitter competition among Russian, British, and American fur traders was resolved in 1824 when Russia granted equal trade rights for all. The near extinction of the sea otter and the political consequences of the Crimean War (1853–56) were factors in Russia's willingness to sell Alaska to the United States. The Russian minister made a formal proposal in 1867, and, after much public opposition, the purchase was approved by the U.S. Congress and the U.S. flag was flown at Sitka on Oct. 18, 1867.

Political growth.   As a U.S. possession Alaska was governed by military commanders for the War Department until 1877. During these years there was little internal development, but a salmon cannery built in 1878 was the beginning of what became the largest salmon industry in the world. In 1884 Congress established Alaska as a judi-

cial land district, federal district courts were established, and a school system was initiated.

In 1906 the first representative to Congress, a nonvoting delegate, was elected, and in 1912 Congress established the Territory of Alaska, with an elected territorial legislature. Alaskans voted in favour of statehood in 1946 and adopted a constitution in 1955. Congressional approval of the Alaska statehood bill in 1958 was followed by formal entry into the Union in 1959.

Establishment of the territory

Mining booms. Other significant events in Alaska's history included early gold discoveries on the Stikine River in 1861, at Juneau in 1880, and on Fortymile Creek in 1886, and later the stampede to the Atlin and Klondike placer goldfields of adjoining British Columbia and Yukon Territory in 1897–1900. Gold discoveries followed at Nome in 1898 and at Fairbanks in 1903. The gold rush made Americans aware of the economic potential of this previously neglected land. The great hard-rock gold mines in the panhandle were developed, and in 1898 copper was discovered at McCarthy. Gold dredging in the Tanana River valley was begun in 1903 and continued until 1967.

Economic growth. A dispute between the United States and Canada over the boundary between British Columbia and the Alaska panhandle was decided by an Alaska Boundary Tribunal in 1903. The U.S. view that the border should lie along the crest of the Boundary Ranges was accepted and boundary mapping was completed in 1913. Between 1898 and 1900 a narrow-gauge railroad was built across White Pass to link Skagway and Whitehorse in the Yukon, and shortly afterward the Cordova-to-McCarthy line was laid up the Copper River. Another railway milestone, and the only one of these still operating, was the 538-mile Alaska Railroad connecting Seward with Anchorage and Fairbanks in 1923. In 1935 the government encouraged a farming program in the Matanuska valley near Anchorage, and dairy herds and crop farming became established there, as well as in the Tanana and Homer regions.

In 1942, during World War II, Japanese forces invaded Agattu, Attu, and Kiska islands in the Aleutian chain and bombed Dutch Harbor on Unalaska. This aggression prompted the construction of large airfields as well as the Alaska Highway linking Dawson Creek, British Columbia, and Fairbanks with more than 1,500 miles (2,400 kilometres) of road. Both proved later to be of immense value in the commercial development of the state.

During the 20th century nearly 40 earthquakes measuring at least 7.25 on the Richter scale have been recorded in Alaska. The devastating earthquake on March 27, 1964 (8.4 on the Richter scale), affected the northwestern panhandle and the Cook Inlet areas, destroying parts of Anchorage; a tsunami that followed wiped out Valdez; the coast sank 32 feet (9.75 metres) at Kodiak and Seward; and a 16-foot coastal rise destroyed the harbour at Cordova.

Discovery of oil

Oil and natural gas discoveries in the Kenai Peninsula and offshore drilling in Cook Inlet in the 1950s created an industry that by the 1970s ranked first in the state's mineral production. In the early 1960s a pulp industry began to utilize the forest resources of the panhandle. Major paper-pulp mills were constructed at Ketchikan and Sitka, largely to serve the Japanese market. The discoveries in 1968 of petroleum on lands fronting the Arctic Ocean gave promise of relief for Alaska's economic lag, but problems of transportation across the state and to the South 48 held up exploitation of the finds. In 1969 a group of petroleum companies paid the state nearly $1,000,000,000 in oil-land revenues, but the proposed pipeline across the eastern Brooks Range, interior plains, and southern ranges to Valdez created heated controversies among industry, government, and conservationists. In November 1973 a bill passed the U.S. Congress that made possible construction of the pipeline, which began in the following year. The completed 48-inch (122-centimetre) pipeline, 789 miles (1,262 kilometres) long, came into operation on June 20, 1977. As a result, oil flows freely from the Prudhoe Bay oil field on the Arctic coast to the ice-free harbour at Valdez, whence tankers transport it to U.S. West Coast ports. Further development of Alaska's petroleum reserves depends upon economic factors and the issue of high production costs in the hostile Arctic environment. In 1989 the oil tanker *Exxon Valdez* ran off course in Prince William Sound, causing the most disastrous oil spill in North American history and inflicting incalculable damage on the area's marine ecology and local economy.   (M.M.M.)

California

California is the most populous state in the Union, and its personal income per capita is one of the highest in the world. The fluid nature of the state's social, economic, and political life, shaped so largely by the influx of people from other states, gives California the aura of a laboratory for testing new modes of living. Yet, by the 1980s, a profound disaffection with growth had set in throughout the state's urban areas.

Californians make up the most urban population in the nation, centred mainly along the coast, with more than three-fourths of its people living in the Los Angeles, San Francisco, and San Diego metropolitan areas. As in most of the nation's larger states, the capital, Sacramento, is not a major population or economic centre.

California has an area of 158,706 square miles (411,049 square kilometres), exceeded only by Alaska and Texas. The state is bounded on the north by Oregon, on the east by Nevada and Arizona, on the south by the Mexican state of Baja ("Lower") California, and on the west by the Pacific Ocean.

No version of the origin of California's name has been fully accepted, but there is wide support for the contention that it derived from a Spanish novel that described a paradisiacal island called California. Admitted to the Union on Sept. 9, 1850, as the 31st state, California is a land of stunning physical contrasts: from the rainy northern coast to the parched Colorado Desert of the south. The Sierra Nevada exceeds the Rocky Mountains in height. Within 85 miles (137 kilometres) of each other lie Mount Whitney and Death Valley, respectively 14,494 and 282 feet (4,418 and 86 metres) above and below sea level, the highest and lowest points in the 48 coterminous states. Despite its urbanization, California is also the principal agricultural state of the nation, though only about 15 percent of its area is cultivated. Almost half of its land is federally owned, with national parks and monuments in every part of the state devoted to irreplaceable forest, desert, mountain, and other natural resources.

The
mountains
of
California

The land. *Coast ranges.* The long coastline of California is mountainous, most dramatically in the Santa Lucia Range south of San Francisco, where the homes of Big Sur perch on cliffs 800 feet above the sea. Hills of lesser height flank entrances to the coast's three major natural harbours, at San Diego, San Francisco, and Eureka. Coastal mountains, made up of many indistinct chains, are from 20 to 40 miles in width and from 2,000 to 8,000 feet in height.

Sierra Nevada. The eastern portions of the state are occupied by sparsely settled desert. The Sierra Nevada rises to the west of this desert. The eastern slope is sheer, dropping 10,000 feet within 10 miles near Owens Lake. On the west the range slopes to the Central Valley, comprising the San Joaquin and Sacramento valleys, in gradually declining foothills. From the wall that rises near Lassen Peak in the north, the Sierra Nevada extends south for 430 miles to the fringes of Los Angeles. It is 50 to 80 miles in width and 27,000 square miles in area. Aside from Mount Whitney, 10 other peaks exceed 14,000 feet in altitude. East–west passes are few and high, some at more than 9,000 feet.

The largest lake of the Sierra Nevada is Lake Tahoe, astride the California–Nevada border at 6,229 feet (1,899 metres). A mountain-ringed alpine lake about 193 square miles in area, it ranks 11th in the world in average depth: the 1,200-foot line runs near shore, and the maximum depth exceeds 1,600 feet (488 metres). Elsewhere in the Sierra lie hundreds of smaller lakes, some above the timberline in regions of tumbled granite and smooth-walled canyons. There are three national parks in these highlands: Kings Canyon, Sequoia, and Yosemite—the latter rising from the purplish foothills of the Mother Lode gold country through ice-carved valleys of the Merced and Tuolumne rivers, with their waterfalls and granite domes.

Central Valley. The Central Valley runs for 450 miles (720 kilometres) through the centre of California, forming a trough between the Coast Ranges to its west and the Sierra Nevada to its east. The valley is the state's agricultural heartland. Its single opening is the delta through which the Sacramento and San Joaquin rivers drain into San Francisco Bay. The valley is sealed off at the northeast by the Cascade Range and at the northwest by the Klamath Mountains. This far north the terrain is rugged and sparsely populated, heavily timbered and wet on its coastal side and drier and barren in the higher northeast. In the south the Central Valley is closed off by the transverse ranges, notably the Tehachapi Mountains, which are regarded as a dividing wall between southern and central California.

Deserts. Most of eastern California is desert. The northeastern corner of the state is high desert, a jumble of barren plains and mountains and lava country, sparsely settled and sustaining little but open-range ranching. In the east central region is the Trans-Sierra desert, which extends along the sheer east escarpment of the Sierra Nevada range and comprises part of the vast interstate Great Basin of the Basin and Range Province. The Trans-Sierra desert ranges from 2,000 to 7,400 feet above sea level. Its largest towns are in the Owens Valley, a fertile farmland until its groundwater flow was diverted to Los Angeles through a mammoth series of conduits built in 1908–13.

The
Mojave
Desert

In the southeast lies the Mojave Desert, which occupies one-sixth of the land area of California, more than 25,000 square miles. Its landmarks are broad basins and eroded mountains, fault blocks, and alluvial surfaces, most lying more than 2,000 feet above sea level. Vegetation includes the evergreen creosote bush, yucca, saltbush, burroweed, encelia, cottonwood, and mesquite. Higher up are juniper and piñon pine. The clear skies and sparse settlement of the Mojave Desert have made it an ideal setting for aviation and ordnance testing. Long airstrips at Palmdale and Edwards Air Force Base are important for the testing of new aircraft and for projects of the U.S. space program. Most of the Mojave's population lives in small towns and military bases on the desert's southwestern edge.

The lower Colorado Desert begins in the Coachella Valley, where Palm Springs has spawned a series of resorts. This desert descends to the Imperial Valley; adjacent to the Mexican border, the valley is an agricultural area known for its winter crops. More than 4,000 square miles of this desert lie below sea level, including the 300-square-mile Salton Sea, a lake with no outlet, created in 1905–07 when the nearby Colorado River broke out of its channel.

Coastal settlement and forests. Southern California's dense settlement lies along a coastal plateau and in valleys ranging from 40 to 60 miles inland. North of the Tehachapis population becomes sparser along the coast. The populous coastal area around San Francisco Bay gives way to the less developed northern coast, where lumbering and fishing villages lie beside creeks and rivers flowing from the Coast Ranges. This is the area of coastal redwood forests and Redwood National Park. These trees, among the tallest in the world, may reach 300 feet (90 metres) in height and are 15 to 35 feet in diameter; some are 4,000 years old. Before European settlement the redwoods covered an estimated 1,500,000 acres (607,000 hectares) of California. Most redwood forests have been cut, but 109,000 acres of redwoods are protected in state and national parks.

The
redwood
forests

Drainage and water resources. Water is chronically scarce in southern California and the desert regions, but excesses of rain and snowmelt cause winter flooding along the rivers of the northern coast. More than 70 inches of rain falls at Crescent City, near the Oregon border; and the village of Honeydew, in the redwoods of Humboldt county, has received as much as 174 inches in a year. Southern California, in contrast, has most of the state's population but only about 2 percent of its water, with an average annual rainfall of 15 inches, entirely in the winter months. Complex systems of dams and aqueducts move water from north to south, but not without the protests of those who regard the export of water from their regions as a bar to future growth or as a threat to environmental balance. The Colorado River Aqueduct moves water from the river, at the Arizona border, across the southern California desert and mountains to serve the Los Angeles metropolitan area. The California State Water Project, launched in 1960, is the largest water-transfer system ever undertaken. It is designed to deliver water daily from the Feather River to communities as far south as the Mexican border.

Climate. The climate of the entire Pacific Coast is milder and more uniform in temperature than that of the states in corresponding latitudes east of the mountains. A mean annual temperature as low as that of Halifax, N.S. (latitude 44° 39′ N), is not found at any Pacific Coast point south of Sitka, Alaska (latitude 57° N), while the mean at San Diego is 6° to 7° F (3.3° to 3.9° C) less than that at Vicksburg, Miss., and Charleston, S.C., in roughly the same latitude. The means of winter and summer are very near the yearly mean. This condition is not so marked inward from the coast; yet everywhere, save in the high mountains, the winters are comparatively mild.

Division of the year into two seasons—a wet one and a dry one—marks this portion of the Pacific Coast in the most decided manner, being truly characteristic neither of Baja California nor of the greater part of Oregon, though more so of Nevada and Arizona. Except on the coast, the dryness of the air and the consequent rapidity of evaporation greatly lessen the disagreeableness of summer heat.

Range of
tempera-
tures
and rainfall

Summer temperatures in the low-lying Colorado Desert, reaching as high as 130° F (54° C), compare with the highest of Africa's Sahara. Annual rainfall in this desert averages three to four inches (75 to 1,000 millimetres). In the higher eastern deserts of California, however, summer temperatures are moderate. Winter temperatures atop the Sierra Nevada are arctic. Rainfall ranges from 174 inches (4,420 millimetres) in the northwest to traces in the southeastern desert, but moderate temperatures and rainfall prevail along the coast. The average annual temperature is about 65° F (18° C) in Los Angeles and 57° F (14° C) in San Francisco. Annual precipitation averages about 14 inches in Los Angeles and 21 inches in San Francisco.

The moderate climate has been a major factor in the concentration of settlement along the coast, where cool ocean breezes hold off heat, and temperatures seldom

exceed 90° F (32° C) or drop to freezing. Low humidity usually prevails. Climate changes rapidly with the altitude extremes of California, and the coastal cities are only hours away from mountain skiing or desert sports.

Animal life. California's animal life is as varied as its geography; about 400 species of mammals and 600 species of birds are identified. The California grizzly bear is extinct, however, and the rare bighorn sheep are found mostly in remote desert mountains. The endangered California condor is being nurtured with the help of zoo hatching programs. Coyotes and pumas (cougars) prowl remote mountain areas, while the more common deer, bobcats, and black bears are found in various habitats. In drier areas and deserts there are squirrels, jackrabbits, and chipmunks. Even the hottest deserts support desert tortoises, horned toads, and rattlesnakes. Among common birds are California jays and thrashers, juncos, mountain bluebirds, and hermit thrushes. Trout and salmon are important species that run in California streams and rivers, and the yield from the state's shores include bass, perch, rockfish, and tuna.

The people. *Ethnic distribution.* The influence of Spanish settlers of the 18th and 19th centuries is evident in California's architecture and place-names. The many Californians with Spanish surnames largely reflect the 20th-century immigration from Mexico—to escape that nation's revolution (1910–17) or to find agricultural jobs.

It was the Spanish missionaries who both converted and subjugated the California Indians in the construction of the California mission chain. When the missions were secularized in 1833, some 30,000 Indians were farming under the direction of priests and soldiers at 21 missions. Disease decimated the Indian population for decades after the Spaniards' arrival. Only in the mid-20th century did the California Indian population again begin to increase. Of the Indian population of some 200,000, about 6 percent live on reservations.

The first settlers from the United States were mostly Midwestern farmers of Anglo-Saxon descent. With the gold rush a more cosmopolitan mix appeared. Ships sailed into San Francisco from the Atlantic Seaboard, Europe, and the Orient. In 1850 more than half of the Californians were in their 20s, typically male and single. Only a few hundred Chinese lived in the state in 1850, but two years later one resident out of 10 was Chinese; most performed menial labour. Irish labourers came with the railroad construction boom during the 1860s. The Irish, French, and Italians tended to settle in San Francisco. As Los Angeles began to grow at the end of the 19th century, it lured Mexicans, Russians, and Japanese, but primarily an additional influx of Anglo-Saxons from the Midwest.

Discrim-
ination
against
Asians Discrimination grew strong, especially against Asians. An alien land law intended to discourage ownership of land by Asians was not ruled unconstitutional until 1952. At one time the testimony of Chinese in courts was declared void. Separate schools for Asians were authorized by law until 1936, and not until 1943 was the Chinese Exclusion Act repealed by Congress. As discrimination against the Chinese flared, Japanese were encouraged to immigrate, and in 1900 alone more than 12,000 entered California. Prospering as farmers, they came to control more than 10 percent of the farmland by 1920, while constituting only 2 percent of the population. Los Angeles became the centre of the nation's Japanese community, while San Francisco's Chinatown became the nation's largest Chinese settlement.

Discrimination against the Japanese smoldered until World War II, when about 93,000 Japanese-Americans lived in the state. Some 60 percent were American-born citizens known as Nisei; most of the others were Issei, older adults who had immigrated before Congress halted their influx in 1924. Never eligible for naturalization, the Issei were classed as enemy aliens. During 1942 almost all of California's Japanese-Americans, both Nisei and Issei, were moved to isolated inland camps and held under guard until 1945. At the end of the war they found their property sold for taxes or storage fees and their enclaves overrun. After years of litigation some 26,000 claimants were reimbursed for their losses at about one-third of

the claimed valuation. About 85 percent of the Japanese-Americans had been farmers, but with their land gone they became gardeners or went into businesses and professions. In 1988 the U.S. Congress voted grants of $20,000 each to all Japanese-Americans who had been interned.

Asian immigration to California surged in the 1970s and '80s, with Filipinos, Vietnamese, and South Koreans among the newcomers. By 1987 the Asian population of California was estimated at about 6 percent of the total.

Few blacks settled in California until World War II, but between 1940 and 1980 the black population in San Francisco rose from about 5,000 to about 86,000 and in Los Angeles from 64,000 to more than 900,000. California has had among the largest gains of any state in black population, with those leaving the Southern states attracted to such cities as Los Angeles and Oakland despite high unemployment rates there.

About one-third of the nation's Mexican-Americans live in California. Hundreds of thousands of Mexicans entered southern California illegally in the years prior to 1987. In that year the U.S. Congress granted amnesty to those who could establish specific conditions of prior residence. By 1988 about 1,700,000 Hispanics had received temporary resident status under amnesty provisions, an estimated half of them within California.

Hispanic
population

The burgeoning minority populations have confronted police and other officials, especially in Los Angeles, to protest discrimination and unemployment. Black riots leveled much of Los Angeles' Watts area in 1965; race riots in 1992 in south-central Los Angeles were the worst in state history.

Religion. About one-third of Californians list church affiliations, a proportion far below the national average. Judaism is strongest in the Fairfax and Beverly Hills areas of the Los Angeles Basin, Roman Catholicism in San Francisco, and fundamentalist Protestant sects in those parts of southern California inhabited by migrants from the South and Southwest.

Los Angeles has long been notorious for its exotic cults. Aimee Semple McPherson, whose Angelus Temple boasted 35,000 members, is the best remembered of such evangelists, and faith healers still are popular. Scientology, calling itself "the common people's science of life betterment," thrived in southern California under the leadership of L. Ron Hubbard. Zen Buddhism enjoyed popularity in San Francisco during the 1950s, with English-born Alan Watts serving as its Occidental interpreter to a following that included the "Beat Generation" of that era.

Demographic trends. Native-born Americans remained the dominant factor in California's growth phenomenon in the mid-20th century. Many workers who flooded the defense industries during World War II remained as residents, along with hundreds of thousands who first visited the state as military personnel. About three-fifths of the population is concentrated south of the Tehachapi Mountains in about one-fourth of the state's area, with the greatest concentration in the small coastal region.

By 1970, however, the state's growth began to level off. Later migration took place from the crowded cities of California to rural areas and to cities of the Mountain states. Demographers predict continued population increases for California, which is likely to maintain its rank as the nation's most populous state, but these predictions have been scaled down from earlier years.

The economy. In economic terms California is more aptly compared with nations than with states. Its total personal income is surpassed only by that of the United States as a whole and of a few other industrialized nations.

Industry has triumphed over remoteness; lacking iron and coal deposits, California has developed light industry. Financiers have been imaginative in seeking and employing capital, and many of the nation's largest banks and corporations are California-based, the latter principally involved in aerospace, electronics, computers, and oil and gas. California supplanted New York in 1965 as the leading state in the export of manufactured goods. The state is dominant in aerospace (although the industry was declining in the 1990s), agriculture, wine making, and the film and television industries. Despite soaring taxes, California

continues to attract high-income immigration and technologically oriented industry.

Agriculture.   The foundation of California wealth lies in agriculture. Its fields and orchards yield more than 200 agricultural products of astonishing diversity from largely irrigated farmland. Its major cash products are cattle, milk and cream, cotton, and grapes. California produces about one-third of the nation's canned and frozen vegetables and fruits. About half of the farm output comes from the Central Valley, which is irrigated through a labyrinth of dams, canals, and power and pumping plants. California has suffered from periodic droughts, which have had an impact on agricultural production.

The state's agricultural supremacy dates from 1947, when its farm output first exceeded that of any other state. A growing season of nine to 10 months ranks Fresno, Kern, and Tulare counties among the top counties in the nation in value of farm produce. Most farms are huge, and most farm income is earned by only a small percentage of the farms. Many large landholdings have derived from federal land grants to railroads. Such farms have tended to become agricultural assembly lines with absentee owners, high mechanization and productivity, and persistent labour strife. Most farms specialize in one or two crops: almonds grow north of Sacramento; cotton and forage crops, figs, and grapes near Fresno; and in the wet delta, asparagus, tomatoes, rice, safflower, and sugar beets. Specialization has been enhanced by research at the University of California at Davis; this institution also counsels the California wine industry, which produces 90 percent of all the wine made in the United States. The citrus industry, almost destroyed in the 1940s by a virus, ranks second to that of Florida in production of oranges.

Premium wine grapes grow in the Napa and Sonoma valleys north of San Francisco and in adjacent areas. The Imperial Valley in the Colorado Desert in the extreme south, though smaller in area than the Central Valley, has about 500,000 irrigated acres (202,000 hectares) of farmland. Other major farming areas include the Coachella Valley near Palm Springs, where dates and grapefruit grow, and the Salinas Valley and Monterey Bay region.

The farm labour pool is made up of low-income labourers, including the many migrants and Mexican nationals crossing the border in harvest seasons. Long abused, migrant labourers organized in the late 1960s under the leadership of César Chavez and began lengthy strikes that drew nationwide support in the form of consumer boycotts. Thereafter, however, Chavez' United Farm Workers lost much of its membership to the Teamsters Union.

Mining.   Petroleum production grew rapidly after 1895, with oil strikes in the Los Angeles–Long Beach area. California led all states in petroleum production from 1900 to 1936. Reserves now, however, are being depleted at a rapid rate, and fuel and natural gas are imported. Petroleum continues, however, to exceed the total of all other minerals in value of production. Gold mining is now insignificant. Other production includes natural gas, cement, sand and gravel, borate, soda, and salt.

Fisheries and forestry.   California has a significant commercial fishing industry. Largely ocean fish, the yield includes tuna, mackerel, sole, squid, sardine, and salmon. Ownership of commercial forestland is almost equally divided between public agencies and private interests, with a total of almost 17,000,000 acres in use.

Industry.   The aircraft plants and shipyards were supplemented after World War II by branch plants of many Eastern and Midwestern industries. Federal research-and-development funds allocated to California organizations also contributed to the postwar economy. By the 1970s and '80s, California's industries had diversified to include computer sciences, biotechnology, and health care. Construction has also become a major industry.

All federal military services have major facilities in California, affecting both the social and economic life of the state. Recruit training is the major role of naval and marine corps bases in San Diego. Camp Pendleton, a marine base, encompasses the last large undeveloped area along the southern California coast. Air force activity centres around the Vandenberg base on the central coast and on

various other air commands, including the remote and esoteric test facilities in the Mojave Desert. Federal cuts in the 1990s have forced numerous military base closings, and have generally devastated the defense and aerospace industries of California.

Tourism and recreation.   Tourism is a consistent source of income in California. Inherent to this industry are such theme parks as Disneyland and Sea World; these sizable employers are part of the state's large service industry, which ranks second only to manufacturing among the state's industry payrolls.

No state offers more diverse recreation. There is good skiing along the Sierra Nevada as far south as Big Bear Mountain near San Bernardino. Squaw Valley near Lake Tahoe was the site of the Winter Olympic Games in 1960. The beaches of southern California, especially those from Santa Barbara to San Diego, are legendary; they are excellent for water sports, of which surfboarding is prominent. Hikers pursue the trails of the High Sierra, including the 212-mile John Muir Trail through the heart of the Sierra Nevada, and the Pacific Crest Trail, which runs the length of the state. Fishing enthusiasts and hunters choose from extraordinary range and diversity in their sports.

More than one-fourth of the state's land area is set aside in recreation areas or in national seashores or wildlife refuges. Yosemite, Kings Canyon, and Sequoia are national parks in the Sierra Nevada. Along the 1,100-mile (1,770-kilometre) California coast, about 40 percent of the shoreline is accessible and is visited by an estimated 50,000,000 people each year. Redwood National Park preserves 58,000 acres (23,500 hectares) of redwood trees extending for nearly 40 miles along the Redwood Highway near Crescent City. Among the 250 units of the state park system is Anza-Borrego Desert State Park, in the Colorado Desert. Running 54 miles north–south and containing some 550,000 acres, it is the largest continuous state park in the United States. There are also more than 5,000 city, county, and special district parks, including the four-mile-long Golden Gate Park in San Francisco.

Film industry.   The industry for which California has been most popularly known is that of movies and television, centred in and around Hollywood. The pioneers of the motion-picture industry found southern California extremely well suited to their needs of maximum sunshine, mild temperatures, varied terrain, and a labour market.

The 1920s, '30s, and '40s saw Hollywood as the centre of a movie industry with a worldwide market. Real estate boomed, and riches were extravagantly displayed. The studios were ill prepared, however, for the revolution that they faced as a result of competition with television beginning after World War II. Grown soft from the ready demand for any product, they found that millions were staying home to see anything on television in preference to going out to the motion-picture house. At about the same time, a series of court decisions judged the major producing companies to be trusts in restraint of trade. Although new techniques such as the wide screen, richer colour, new lenses, and stereophonic sound were introduced, serious losses were suffered by the industry. Major studios began to sell their film backlogs and to sell or lease their facilities to television concerns. Some studios, such as Universal, became mammoth television producers. The presence of thousands of technically skilled artisans in the Hollywood area, as well as vast amounts of equipment, make it unlikely that the entertainment industry will ever be completely uprooted.

Transportation.   Transportation, primarily by automobile and airplane, is in part both the cause and the product of the restless mobility of Californians, who move their residences more often than the average American and travel considerably more both for business and pleasure. California has the greatest concentration of motor vehicles on Earth and the most extensive system of multilane divided freeways. As in most American cities, light rail transit systems were largely discontinued in California cities after World War II. In the face of increasing traffic congestion, however, they have begun to return. The Bay Area Rapid Transit (BART) system, in San Francisco, was completed in the early 1970s. A San Diego trolley system, first built

Farming as big business

Military facilities

Development of Hollywood

in the late 1970s as a link to the Mexican border, was expanded in the late 1980s.

The freeway system

The freeway system is so extensive that one can drive on arterials from San Diego almost 500 miles northward through Los Angeles and the Central Valley without encountering any traffic signals or stop signs. Freeway construction has declined since the 1970s because of public opposition based on ugliness, pollution, and usurpation of private and community property rights. The rise of the freeway system after World War II coincided in Los Angeles with the demise of a 1,200-mile (1,920-kilometre) interurban rail system that had once been the longest such system in the nation. The lack of a conventional urban core in Los Angeles, along with low population densities, has made it difficult to construct modern rapid-transit systems there. Work on a rail link between downtown Los Angeles and the San Fernando Valley began in 1986, however, and construction of rail transit lines between Long Beach and Los Angeles and between Norwalk and El Segundo, near Los Angeles International Airport, began in 1985.

Transport of goods in California is predominantly by trucks. The intricate canals and waterways of the Sacramento River delta carry some waterborne freight traffic, and there is some coastal freight traffic. Maritime shipping across the Pacific Basin is centred at the Long Beach–Los Angeles ports, whose combined volume of cargo is several times greater than that handled by the Oakland, San Francisco, and Richmond ports in northern California.

Air commuting has increased phenomenally. The air corridor connecting San Francisco, Los Angeles, and San Diego has a greater volume than that linking Washington, D.C., New York City, and Boston. Air traffic congestion has become critical, but not so dire as that of the ground traffic around airports.

Administration and social conditions. *Government.* California is governed under a constitution framed in 1878–79, its detail reflecting the disillusionment of the period with rampant graft. Before a series of deletions began in 1966, it had grown longer than any governmental constitution except those of Louisiana and India. Reform has often been undertaken in California through constitutional amendment. Those instituted by Governor Hiram Johnson in 1911 included provisions for voter initiative of and referendum on legislation, recall of elected officials, the direct primary, woman suffrage, and a unique system that allowed candidates to run in primaries of opposing political parties. Since 1962 constitutional revision may be made by voters without calling a convention.

State executive officers are elected for four-year terms, with members of more than 30 boards and commissions being appointed by the governor. The legislature comprises the Senate, with 40 members, and the Assembly, with 80 members. Legislative dominance is held by populous southern California at the expense of rural areas.

California's judicial system

The judicial system has five levels, including the seven-member Supreme Court, district courts of appeal, and superior, municipal, and justice courts. Superior courts are the major trial courts, whereas the more numerous municipal districts hear lesser matters.

Local government is conducted through almost 4,000 agencies, including 58 counties and a few hundred incorporated cities. Counties and cities may establish charters or accept general-law provisions and statutory laws. Cities operate under variations of mayor–council–manager control. Los Angeles and San Francisco operate under mayor–council, while San Diego and San Jose employ city managers, who assume a large share of administrative duty.

Volunteer party organizations often have usurped roles ordinarily fulfilled by the Democratic and Republican party structure. The parties are forbidden to endorse any candidate prior to the primary, but unofficial organizations do so and are often better funded and organized than the party structure. To overcome this party ineffectiveness, candidates turn to professional campaign managers to enhance their public images.

Attempts at machine politics have proved ineffectual because of voter mobility, lack of party entrenchment, and the prime role of civil service in bestowing jobs. The vast-

ness of the state and the political cleavages between the liberal north and the conservative south make it difficult for one party to sweep statewide offices, even with majority registration. Traditional party alignments seem of minor significance to many Californians, and crossovers are common despite heavy Democratic pluralities in registration.

Finances. After state and federal aid, property taxes provide the chief source of local revenue. Rising income, sales, and gasoline taxes support state expenditures dominated by highway building, education, and welfare costs.

Education. California is oriented toward tax-supported public education. The two-year junior or community college was introduced in California in 1907, and there are now about 100 such colleges. Several four-year state colleges and the University of California system complete the public higher-education structure. The University Extension system operates throughout the state. About 10 percent of California schoolchildren and a slightly higher percentage of college-age students attend private schools.

Higher education

According to a master plan that attempts to avoid overlapping roles in the complex system of public colleges and universities, the top one-third of high school graduates is eligible to enroll at one of the state university campuses, which retain supervision over doctoral degrees. Four-year state colleges also draw from among the top one-third of high school graduates. High school graduates from the lower two-thirds of their classes attend two-year colleges and often are able to transfer at the end of that period to one of the four-year campuses.

The University of California has campuses at Berkeley, Los Angeles, Davis, Riverside, Santa Barbara, San Francisco, Irvine, Santa Cruz, and San Diego. The campuses at Santa Cruz and San Diego were established on variations of the Oxford University system of numerous small independent colleges sharing limited central facilities or services. The original campus at Berkeley was founded in 1855 and has remained one of the most prestigious academic communities in the nation.

Health and welfare. California long has been considered a liberal state in the extent of its health and welfare statutes. State funds are dispersed through systems such as aid to families with dependent children, aid to the totally disabled, aid to the blind, and old-age security.

Cultural life. California's culture is marked by widespread public involvement with the arts and enthusiasm for cultural trappings as symbols of achievement, often in the form of lavish expenditures to erect galleries, museums, and concert halls.

As a state California has harboured—and given birth to—a notable procession of creative people in all the arts. Early writers associated with California came from outside the state: Bret Harte, born in New York; Mark Twain, in Missouri; Joaquin Miller, in Indiana; and Ambrose Bierce, in Ohio. But the San Francisco of the gold rush days provided an eager audience for their writing, as it did for theatre and music. There followed a line of writers who came as close to establishing a regional tradition as have California artists in any medium. Jack London, chronicler of men in literature amidst frontier violence, was born in San Francisco. Frank Norris and Upton Sinclair, who opposed the social ills of their times in a foreshadowing of the later work of John Steinbeck and, to a lesser degree, of William Saroyan, were California-born but left the state in the 1940s. The naturalist John Muir, the progenitor of a school of environmental writers, extolled the state's natural wonders. Robinson Jeffers, who lived in California much of his life, was the state's most renowned poet. An influx of literary figures as screenwriters into Hollywood in the 1930s and '40s established little in the way of regional cultural tradition, and the California milieu became instead a favourite target of satire in such novels as Nathanael West's *The Day of the Locust* and Evelyn Waugh's *The Loved One,* and in works by F. Scott Fitzgerald, Budd Schulberg, Raymond Chandler, and Ross Macdonald.

California in literature

San Francisco has produced such painters as David Park, Elmer Bischoff, and Richard Diebenkorn. Los Angeles seems more successful as a marketplace for art, with a thriving colony of galleries along La Cienega Boulevard. The numerous wealthy art collectors in southern Califor-

nia are prominent in funding such institutions as the Getty Museum (1953), the Los Angeles County Museum of Art (1965), and the Museum of Contemporary Art (1979). The Music Center of Los Angeles County is a concert and theatre complex that was constructed during the 1960s by private contributions.

The California Arts Commission was created in 1963 to establish the state as a major cultural centre. Its low budget, however, has limited it largely to inventorying the arts and to providing token sponsorships. Tax-supported state institutions, most prominently the University of California and its extension program, are active in presenting dance recitals, plays and films, concerts, and lectures. The Theater Group of the University of California at Los Angeles is one of the most innovative in the nation. Experimental theatre in San Francisco has bloomed from time to time, and an often distinguished mixture of light and avant-garde theatre is offered throughout the year at several theatres, including the community-sponsored Old Globe Theater and La Jolla Playhouse in San Diego and the Magic Theatre in San Francisco. Amateur theatrical groups are widespread, as are community orchestras, chamber-music societies, and weekend artists. Carmel, Big Sur, and Sausalito have harboured communities of workers in diverse arts. The symphony orchestras of San Francisco and Los Angeles have achieved international recognition, as has the San Francisco Opera Company. The San Diego Symphony began performing in its own downtown hall in 1985.

Hollywood still is responsible for the bulk of the national movie and television output, and as such it remains an international symbol of glamour. An increasing number of national magazines and periodicals emanate from editorial offices that are located in California. Metropolitan California newspapers have decreased in number, but their total circulation has grown, led by the *Los Angeles Times*, with the largest number of readers in the state.

HISTORY

Exploration. Modern California derives from the discovery of gold at Sutter's Mill in 1848, just nine days before Mexico signed the Treaty of Guadalupe Hidalgo, ceding to the United States a vast area of the Southwest that included all of present-day California. The region was neglected by the Europeans for more than three centuries after its first sighting in 1542 by the Spanish navigator Juan Rodríguez Cabrillo. The merchant Sebastián Vizcaíno sailed the southern California coast in 1602, naming San Diego, Santa Catalina Island, Santa Barbara, and Monterey Bay. Despite these early explorations, California was left to its Indian population—estimated at 130,000 when Spanish explorers reached California in 1542.

Settlement. Pressure for settlement came from missionaries eager to convert the Indians and from the intrusion of Russian and British traders, primarily in search of sea otter pelts. In 1769 the Spanish viceroy dispatched land and sea expeditions from Baja California, and the Franciscan friar Junípero Serra established the first mission at San Diego. Gaspar de Portolá set up a military outpost in 1770 at Monterey. Colonization began after 1773 with the opening of an overland supply route across the southwestern deserts.

The 21 missions established by Serra and his successors were the strongest factors in developing California. While attempting to Christianize the Indians, the padres taught them farming and crafts. With the labour of the Indians, the padres irrigated vast ranches and traded hides, tallow, wine, brandy, olive oil, grain, and leatherwork for the manufactured goods brought by Yankee trading vessels around Cape Horn.

U.S. colonization and acquisition. Secularization of the missions was sought by Spanish-Mexican settlers known as Californios when Mexico became independent of Spain in 1821. Between 1833 and 1840 the mission ranches were parceled out to political favourites by the Mexican government. The padres withdrew, and the Indians were cruelly exploited and diminished. In 1841 the first wagon train of settlers left Missouri for California. The colony grew slowly, but in 1846 the Northwest became a part

Establishment of the Spanish missions

of the United States, and settlers at Sonoma proclaimed an independent California republic. In May the United States declared war on Mexico, and in July the U.S. flag was raised at Monterey. Only minor skirmishes occurred before the Californios surrendered to troops under John C. Frémont near Los Angeles in January 1847.

The gold rush. Early in 1848 James Wilson Marshall, a carpenter from New Jersey, picked up nuggets of gold from the American River at the site of a sawmill he was building near Coloma. By August the hillsides above the river were strewn with the tents and wood huts of the first 4,000 miners. From the East, prospectors sailed around Cape Horn or risked disease in hiking across the Isthmus of Panama. The hardiest took the 2,000-mile overland route, where cholera proved a greater killer than Indians. About 40,000 came to San Francisco by sea in 1849. Some 6,000 wagons, carrying about 40,000 more, moved west that year over the California Trail. Few of the prospectors struck it rich. The work was hard, prices were high, and living conditions were primitive. The wiser immigrants became farmers and storekeepers.

Prospectors for gold

Gold hastened statehood in 1850 (as a part of the Compromise of 1850); and, though the gold rush peaked in 1852, the momentum of settlement did not subside. Nearly $2,000,000,000 in gold was taken from the earth before mining became almost totally dormant.

The Civil War and after. The Compromise of 1850 did not settle the slavery issue in California. Political parties were divided according to whether they believed that California should be a free or a slave state, and one movement, led by the backers of California senator William M. Gwin, sought to divide California into two states, one slave and one free. The same group also attempted to promote a Pacific Coast republic. At the opening of the war, however, California sided with the North.

After the war, control of the governor's office passed back and forth between Democrats and Republicans to the end of the century. The political climate after 1876 was distinguished by labour problems and the activity of those seeking to control mining, irrigation, and fruit growing through state funding. Economic problems were particularly intensified by the forces seeking the exclusion of the Chinese, who provided cheap labour. A slump in the 1870s brought increased discontent among the unions.

The problems and agitation of the period resulted in the constitution of 1879, which carried reforms but discriminated against the Chinese. An exclusion law passed by the U.S. Congress that year was killed by presidential veto, but in the next year a treaty agreement with China allowed U.S. regulation of Chinese immigration. This was followed by the Chinese Exclusion Act in 1882, which suspended Chinese immigration for 10 years. In 1902 Congress reenacted exclusion legislation against the Chinese. By cutting off cheap labour, exclusion helped make the huge single-crop ranches unprofitable and led to the proliferation of smaller farms growing varied crops.

Japanese farm workers were brought in to replace the Chinese, but as they grew successful the "yellow peril" outcry rose once again. Japanese agitation, focused largely in San Francisco, affected domestic and international policies. In 1913 the Webb Alien Land Law, designed to keep the Japanese from owning land, was the culmination of anti-Japanese lobbying. Japan and the United States then concluded a gentleman's agreement in which Japan agreed to halt further emigration to the United States.

The 20th century. Reform movements of the early 20th century promoted, among other things, greater influence of the people in government. The effects of the Great Depression were not as devastating in California as in most other parts of the country but were felt nonetheless. Migrant farm workers from the Dust Bowl of the Great Plains flocked into the state to seek work, a situation that caused widespread social unrest. Depression conditions gave rise to a number of social welfare schemes, including the End Poverty in California (EPIC) reform movement, presented by the noted author Upton Sinclair. The Democratic Party also grew strong during the Depression era. Nevertheless, Republicans dominated the statehouse during the first half of the 20th century, the Democrats

gaining control only during 1939–43. Notable among the Republican governors was Earl Warren, who resigned in 1953 to become chief justice of the United States, the first person of his state to hold the office.

In 1958 a Democratic victory installed Edmund Brown as governor. The Republican defeat reflected a national trend, and Democrats not only won gubernatorial and U.S. senatorial races but for the first time in the 20th century received a majority of seats in both houses of the state legislature. In 1966 Republican Ronald Reagan, a former actor who in 1981 became president of the United States, replaced him. From the 1960s on, the state see-sawed between the Democrats and Republicans.

20th-
century
growth

Meanwhile, the economy and population advanced. The tide of immigration first moved toward southern California about 1900, spurred by citrus, oil, and some wariness of San Francisco after the earthquake and fire of 1906. Land booms came and went. Agriculture in inland valleys and industry in the cities boomed. During World War II aircraft plants and shipyards expanded, and in the 1950s and '60s research and educational facilities burgeoned as the movement of people to the West Coast came to include an unusual share of scientists and academicians.

The 1970s and '80s were marked by shifting demographics. New urban centres emerged, and smaller cities experienced the most rapid rate of growth. The population of San Diego's metropolitan area rose past 2,000,000 and included the highest proportion of college graduates of any of the 10 most populous American cities. There was also rapid growth in new suburban areas near San Jose, Sacramento, and Riverside. For a century San Francisco had served as a financial and corporate centre, but most major corporations had relocated their headquarters to more populous southern California by the late 1980s.

California's population continued to increase rapidly throughout the 1980s, after which a national economic recession caught up with the population boom. In the early 1990s the U.S. government decreased defense spending, shrinking the state's expansive aerospace and military contracting industry. At the same time, California was plagued with a series of natural disasters—floods, fires, droughts, and earthquakes—which contributed to diminishing the allure of the Golden State. In 1994 California began moving toward economic recovery in the footsteps of the rest of the nation. (N.Mo./Ed.)

Hawaii

A group of volcanic islands in the central Pacific Ocean, Hawaii was characterized by Mark Twain as "the loveliest fleet of islands that lies anchored in any ocean." The name is thought to derive from Hawaiki, the former name of Raiatea, one of the Society Islands, from which Polynesians sailed in voyaging canoes to settle after AD 1000. It became, on Aug. 21, 1959, the 50th state of the United States.

The 50th
state of
the United
States

Hawaii is economically vigorous, with diversified agriculture and manufacturing; strategically important to the global defense system of the United States; a Pacific Basin transportation and cultural centre, often called the Crossroads of the Pacific; and a major tourist mecca. Hawaiian activities of national and international importance include research and development in oceanography, geophysics, astronomy, satellite communications, and biomedicine.

The capital city of Honolulu, on the island of Oahu, is 2,397 miles (3,857 kilometres) from San Francisco to the east and 5,293 miles (8,516 kilometres) from Manila, in the Philippines, to the west.

PHYSICAL AND HUMAN GEOGRAPHY

The land. *Relief.* The land area of the state of Hawaii consists of the tops of a chain of emerged volcanic mountains that form eight major islands and 124 islets, stretching in a 1,500-mile crescent from Kure Island in the west to the island of Hawaii in the east, with a combined land area of 6,471 square miles (16,759 square kilometres). With the exception of Midway, a U.S. naval reservation near the western end of the archipelago, the leeward coral atolls and central lava islets—forming a total of only

3¹/₄ square miles—are in the Hawaiian Islands National Wildlife Refuge. The eight major islands at the eastern end of the chain are, from west to east, Niihau, Kauai, Oahu, Molokai, Lanai, Kahoolawe, Maui, and Hawaii. Volcanic activity has become dormant, with the exception of the volcanoes of Mauna Loa and Kilauea on the easternmost and largest island, Hawaii, where spectacular eruptions and lava flows take place from time to time. The highest Hawaiian mountains are Mauna Kea and Mauna Loa, reaching 13,796 feet (4,205 metres) and 13,678 feet (4,169 metres) above sea level, respectively.

Eight
major
islands

There is little erosion in the geologically young areas, where the terrain is domelike and the volcanic craters are clearly defined. In the older areas the mountains have been shaped and eroded by the action of sea, rain, and wind. Their aspects thus include sharp and craggy silhouettes; abrupt, vertically grooved cliffs pocked with caves; deep valleys; collapsed craters (calderas); and coastal plains. The powerful Pacific surf, churning and crashing against the fringing coral shelves and the lava shorelines, has carried minute shells onto the shore and reduced coral and large shells to sand, creating the state's famous expanses of beach.

Volcanic ash, gravel, rotted vegetation, crumbling lava, and windblown sand and dust all help to make up the alluvial, residual, and organic soils found in various depths and densities in valley floors, the regions between mountain ranges, and along the shores. Oxidation of iron causes a ubiquitous bright red soil and rock strata. The iron content is, however, insufficient for smelting, and there are no coal or petroleum deposits.

Because the topography is generally abruptly descending or sloping, there are few surface collecting basins or lakes. Excess rainfall seeps through porous mountain areas to collect in subterranean chambers and layers retained by less permeable lava and ash beds, or it is prevented by underlying salt water from seeping to the sea. The resultant artesian water supply is tapped for use in irrigation and also for human consumption.

Heavy rainfall in mountainous areas produces an extremely voluminous runoff, which is responsible for the erosion that forms the numerous grooves, ridges, and V-shaped valleys characteristic of the older volcanic islands such as Kauai and Oahu. The action of rain combined with waves has had a particularly dramatic effect on the more exposed windward sections of the islands.

Climate. Hawaii lies just below the tropic of Cancer, and its mild tropical climate is considered by many people to be the world's ideal. Although often humid by U.S. mainland standards, temperatures are conditioned by the northeast trade winds, which prevail most of the year. Blowing for many miles over the open Pacific, the trades pass along the great reservoir's stabilizing influence, to make living on the islands delightfully comfortable.

Mild
tropical
climate

The average temperature in downtown Honolulu is 72° F (22° C) in the coolest month and 78° F (26° C) in the warmest, with extremes from 57° F (14° C) to 88° F (31° C) having been recorded there. The average water temperatures off Waikiki Beach, near Honolulu, range from 75° F (24° C) in late February to 79° F (26° C) in late September. Mountainous regions are considerably cooler, especially during the winter months, when there can be frost; a temperature of 1.4° F (−17° C) has been recorded on the summit of Mauna Kea, and winter snows frequently blanket the crests of Mauna Kea and Mauna Loa.

Rainfall variations throughout the state are dramatic. Mount Waialeale, on the island of Kauai, is often called the wettest spot on Earth, with an annual average rainfall of 444 inches (11,280 millimetres) over a 60-year period, the highest long-term median on record. The driest area is at Kawaihae, on the island of Hawaii, where the average annual rainfall is only 8.7 inches (220 millimetres). The average yearly rainfall in Honolulu is 23 inches, and in Hilo it is 129 inches.

As moisture-laden air is carried over the islands, most frequently by the trade winds, it is apt to condense, form cap clouds, and dissipate against the shores and mountains of the windward coasts, which are therefore more lush in foliage than the leeward coasts.

Plant and animal life. The seeds of endemic plant species were carried to Hawaii by birds, winds, or currents and tides, bringing about extensive forestation, shrubbery, and grasslands, where soil and precipitation were favourable. Since the first Polynesian settlement a tremendous variety of food and ornamental plant life from many parts of the world has been introduced. Food plants grown commercially or in backyards for home consumption include sugarcane, pineapples, papayas, bananas, mangoes, guavas, lichee, coconuts, avocados, breadfruit, macadamia nuts, limes, passion fruit, taros, and tamarinds. Nearly all varieties of common garden vegetables are raised in the islands, and flowers abound all year.

The effects of isolation on natural life

Endemic birds, long isolated from others of their kind, have taken on certain characteristics of their own. These include the nene (Hawaiian goose), the Hawaiian stilt, and a variety of small forest birds. Some species have become extremely rare, but as the result of an increased environmental awareness, great strides have been taken to preclude their extinction. Seabirds nest in profusion on the western islands of the archipelago and to a far lesser extent among the major eastern islands. There has been considerable importation of birdlife. Quantities of mynas, sparrows, cardinals, and doves live in the trees in both urban and country areas. Every fall the small golden plover make an awe-inspiring, nonstop 3,000-mile (4,800-kilometre) flight from Alaska to Hawaii, where they spend the winter, together with ducks from Alaska, Canada, and the northwestern United States.

Wild animal life includes mongooses, rats, frogs, toads, and, in the more remote regions of some of the islands, deer, sheep, pigs, and goats. The insect population is multitudinous, and marine life abounds in Hawaiian waters.

Settlement patterns. Agricultural and fishing activities bring about extensive and scattered rural settlement, ranging from tiny fishing villages far off the main roads, scant clusters of small houses in isolated valleys, solitary farm and ranch houses, to large coastal and upland villages and plantation and ranch towns.

The older houses in the smaller villages are largely single-family, raised, frame structures, with corrugated-iron roofs. Plants of native origin skirt the foundations of houses, and the yards are informally planted with fruit and flower trees. In all but the very small villages, there are a school, markets, a post office, a fire station, and at least one church. The day's activities traditionally begin early and end early, following the sun. The life-style of the rural people is simpler and less sophisticated than that of the urban populations, and the country dwellers tend to retain more of the speech patterns and customs of their distinctive ethnic backgrounds.

Village and urban life

During the 1950s and '60s there was a building boom in Hawaii of such magnitude that the configuration of entire towns was altered. The most graphic example of this was in the city of Honolulu, where construction of 20- and 30-story buildings gave the city, once sprawling and low, a thrusting, multileveled skyline. On Oahu, erstwhile vacation or agricultural towns have become expansive residential areas for commuters to Honolulu and Pearl Harbor.

Urban settlement once consisted almost entirely of single-family dwellings, individual business houses and shops, small markets, and three- or four-story hotels. With the increase of residents and tourists since 1950, however, Hawaiian towns and cities have built more and more high-rise apartment houses, hotels, and business establishments, with the traditional individual shopkeepers becoming absorbed into the complexes of shopping centres and supermarkets. The concept of the planned city has been developed in areas that were previously open spaces or given over to agriculture.

The people. Most anthropologists believe that the original settlement of Hawaii was by Polynesians who migrated northwest from the Marquesas Islands perhaps as early as AD 400, to be followed by a second wave of immigration that sailed from Tahiti during the 9th or 10th century. Once they had established themselves in Hawaii, the Hawaiians had no further need to obtain supplies from their old homeland and underwent centuries of isolation. Although there are still rather close resemblances

in linguistics, physical characteristics, and general customs and life-styles between the Hawaiians and their Polynesian relatives, a degree of racial individuality evolved.

The original Hawaiians were a brown-skinned people of large stature, highly skilled in fishing and farming, who adhered to an extremely rigid and strict system of laws that was set down by their chiefs and their priests. They worshiped and feared a group of gods not unlike, in character and power, the ancient Greek deities of Mount Olympus.

The first recorded contact between the Hawaiians and Europeans took place in 1778, when Captain James Cook came upon the islands. During the ensuing four decades the influence of European and American explorers, adventurers, trappers, and whalers stopping for fresh supplies at Hawaiian islands was to have a profound effect.

Contact with people of different cultures who believed in only one god eventually brought about a spiritual revolution among the Hawaiians. In a series of defiant acts led by members of the royal family, the basic beliefs of the Hawaiian religion were undermined, and the priests were overthrown. Loss of faith in the old gods, intense interest and curiosity about the ways of the people of the United States and Europe, avid interest in learning to read and write, and a desire for spiritual identity brought about a swift adoption of Christianity on the part of the Hawaiians. The first group of Christian missionaries arrived from the United States in 1820, and by the mid-19th century the Hawaiian kingdom was largely a Christian nation.

Impact of the cultural mix

It has been estimated that the population of the Hawaiian Islands at the time of Captain Cook's discovery was approximately 300,000. Virtually disease free, this population had no natural immunity to the diseases introduced from both West and East and fell easy prey to venereal disease, cholera, measles, bubonic plague, and leprosy, all of which contributed to the decimation of the native peoples. In 1853 the native population of the Hawaiian kingdom numbered 70,036.

The racial and religious makeup of Hawaii has undergone quite dramatic change since that time. Thousands of settlers from the Pacific Basin—primarily from Japan, the Philippines, and China—as well as immigrants from Europe and from the U.S. mainland carried their own customs, languages, and religions into the Hawaiian way of life. The descendants of these later settlers now far outnumber the descendants of the original Hawaiians. There is also a continuous influx and outflow of military and naval personnel and their dependents, connected closely to the continuing American presence in the Pacific.

Most of the state's residents live on the island of Oahu, 60 percent in the Honolulu urban area and another 20 percent in outlying districts. Because there are vast areas of Oahu devoted to agriculture and forest reserves, the majority of the population actually resides in high-density clusters. Honolulu is the only legally incorporated town or city in the state.

Hawaii is English speaking. Although Hawaiian, formerly a major means of communication, is all but extinct, it remains in place-names and street names and in songs, and the local residents liberally sprinkle their speech with words and phrases from the traditional language. A pidgin English is spoken throughout the state in varying degrees of richness, while some of the older immigrants from Japan and China continue to speak their native tongues. As Filipinos continue to move to Hawaii, their language, too, is frequently heard in the state.

Linguistic diversity

The largest religious groups are Roman Catholics and Protestants. There are, however, small but important groups of Buddhists and of adherents of other Asian religions.

The economy. Hawaii ranks relatively low among the states in terms of personal income, farm products sold, value of manufacturing shipments, retail sales, and bank deposits.

A major problem in Hawaii is the high cost of living, due in large part to Hawaii's insularity and dependence on imports. Transportation costs are included in the prices of nearly all consumer goods. As the population increases, housing grows increasingly difficult to acquire, and it is disproportionately expensive when compared with housing

costs in many of the mainland states. Building materials, most of which are imported, are expensive. Residential land is limited and highly priced, since much of the property, notably on Oahu, is owned by corporations and trusts. Efforts have been made through legislation to remedy this situation. Carefully planned housing located in communities in which the single-family home gives way to high-rise, high-density dwellings as well as townhouses and apartment complexes has become one solution to the shortages and expense associated with urban housing.

State and private interests

More than half the land in the state is owned by private individuals or corporations, although the state itself, holding more than one-third of the land, is the largest single landowner. State and county governments are major employers. Honolulu is the regional headquarters of the federal government, which owns one-sixth of the land.

Resources. Hawaii has no important mineral deposits; its only natural resources are its climate, water supply, soil, vegetation, and surrounding ocean and rock, gravel, sand, and earth quarried for use in construction and landscaping. Electric power is supplied by a small number of power companies operating oil-powered steam and diesel generators. Several military installations and some private institutions generate their own power. A small amount of hydroelectric power is generated on several of the islands, and in the mid-1980s a geothermal plant began producing electricity on the island of Hawaii.

Tourism. Tourism is Hawaii's largest industry. Expansion has been particularly rapid since World War II, and the growth has resulted in part from continued improvements in transportation and the stimulus provided by the state government and local businesses. The majority of visitors come from the U.S. mainland, Canada, Australia, and countries of the Far East, particularly Japan. About 60 percent of the hotel units are on Oahu, chiefly in Waikiki and the adjacent Ala Moana area. Visitors have access to a wide range of recreational and cultural facilities, such as golf courses, tennis courts, parks, surfing sites, beaches, restaurants, theatres, musical attractions, and sporting events. Tourism has helped Hawaii to become the centre of the international market of the Pacific Basin. Capital investment by U.S. mainland and foreign companies has increased tremendously.

Agriculture. Although the second largest source of income in Hawaii is the federal government, primarily

Sea cliffs on the northwest coast of the island of Kauai, Hawaii.

through defense expenditures, agriculture remains the basis of the local economy. Hawaii is the second largest sugarcane-producing state in the nation and leads in the production of pineapples. Hawaii's dominance of the world pineapple market is challenged by the lower labour costs in pineapple-producing countries such as the Philippines. There has been a slow but steady growth of diversified agriculture, including grain sorghum, corn (maize), flowers, and nursery products. Livestock, poultry, and dairy production, together with some lumbering and commercial fishing, are other important sources of income. Nearly half of the commercial fish catch is aku (skipjack tuna).

Industry. Hawaii has several hundred companies engaged in diversified manufacturing. Heavy-manufacturing plants, using raw materials for the most part imported from the U.S. mainland, include an oil refinery that produces a variety of petroleum products and chemical compounds, a steel mill manufacturing reinforcing bars, several cement plants, a concrete-pipe plant, and an aluminum-extrusion plant. Heavy manufacturing is confined mainly to the island of Oahu. Most building lumber is imported from the mainland. A number of garment manufacturers, largely situated in Honolulu, produce printed fabrics and apparel marketed locally, nationally, and abroad.

A wide variety of Hawaii-grown foodstuffs, sold locally and exported to the mainland, are processed in the state. These include Oriental and Hawaiian food specialties, such as tropical fruit juices, jams and jellies, candies, coffee, macadamia nuts, and various alcoholic beverages.

Major Hawaiian industries are unionized, as are many of the service and construction industries. The largest union in the state, and one with a turbulent history, is the International Longshoremen's and Warehousemen's Union.

Trade and finance. Exports are largely in the form of sugar, canned pineapple, garments, flowers, and canned fish. Major imports are fuel, vehicles, food, and clothing.

State taxes are collected under a centralized tax system. The chief sources of the state's revenue are a general excise tax, individual income taxes, and federal grants-in-aid.

Transportation. Ocean-surface transportation is Hawaii's lifeline, and Honolulu Harbor, with its extensive docks, warehouses, and storage sheds, is the centre of Hawaiian shipping. A large percentage of the cargo ships ply between Hawaii and California ports, a few between Hawaii and the East Coast of the United States via the Panama Canal, and others from western Pacific ports. Around-the-world passenger ships carry visitors through Honolulu, and there is an interisland luxury cruise line. Tug-pulled barges and small freighters transport goods from Honolulu to the outer islands, returning with agricultural crops and livestock.

The importance of Honolulu Harbor

The majority of voyagers to and from Hawaii travel by air, as do nearly all interisland passengers. The Honolulu International Airport, on Oahu; General Lyman Field at Hilo, on Hawaii; and the Kahului Airport, on Maui, are the major civilian airports capable of serving large-jet traffic. There are several smaller airports among the islands and a number of small private airfields. Military authorities maintain a number of airports throughout the state.

Most of the roads follow lowland contours, circling the islands along or near the shorelines and crossing islands only between mountain ranges. There are many spectacular mountain roads providing dramatic vistas. On Oahu two tunnels bring traffic from the heads of two valleys behind Honolulu through the Koolau Range and out into the windward, or northeastern, side of the island. Hawaiian roads range from narrow country tracks to an eight-lane freeway, which crosses the city of Honolulu.

Administration and social conditions. *Government.* Hawaii is governed by a state constitution that was originally adopted in 1950; it was amended in 1959, at the time of admission to statehood, and further amended at the constitutional convention of 1968. The governor and lieutenant governor, elected for concurrent terms of four years, must be members of the same political party. They are not permitted to serve more than two consecutive terms. The only other elected members in the 17 departments of the executive branch are the members of the Board of Education. Hawaii's bicameral legislature con-

Executive, legislative, and judiciary

sists of the Senate, with 25 elected representatives from 25 senatorial districts, serving four-year terms, and the House of Representatives, consisting of 51 members elected from 51 districts for two-year terms. The state judicial system consists of the Supreme Court, an intermediate appellate court, four circuit courts, and four district courts, as well as a family court, a land court, and a tax appeal court. Judges in the higher courts are appointed by the governor, subject to approval of the Senate.

Hawaii's governmental structure is unique among the states in that it is limited to two levels of government: the state and the four counties, each with a mayor and a council. There are no municipal governments.

Primary elections are held in October and general elections in November. Party competition is intense in Hawaiian politics. During the first half of the century, the Republican Party remained dominant, but party success at the polls began to seesaw somewhat, and the Democratic Party has captured a majority of House, Senate, and council seats on several occasions.

Military. Hawaii holds a strategic position in the defense system of the United States. Pearl Harbor, a vast shipyard for the repair and overhaul of U.S. fleet units, is the home port for many U.S. naval ships. It serves as a training base for submarine and antisubmarine warfare forces. The headquarters of the commander in chief, Pacific, and of the Fleet Marine Force, Pacific, are at Camp H.M. Smith. The major army, marine, and air force bases are Schofield Barracks, Fort Shafter, Fort De Russy, Hickam and Wheeler air force bases, and the Kaneohe Bay Marine Corps Air Station. In addition to these there are military installations, camps, and airfields of varying sizes throughout the state. More than 100,000 U.S. military personnel and their dependents are stationed in or have their home port in Hawaii, and their presence has an important influence on the local economy and social life.

Education. Hawaii's school system provides educational facilities from nursery school through the graduate school level. Institutions of higher learning include the University of Hawaii, several smaller private colleges, and a state-established system of two-year community colleges. Private business, technical, and specialized schools provide additional educational facilities and opportunities.

The Center for Cultural and Technical Interchange Between East and West, commonly referred to as the East–West Center, is a project of the federal government housed at the Manoa campus of the University of Hawaii. It provides specialized and advanced academic programs and technological training to students from the United States and from countries in Asia and the Pacific.

Health and welfare. The Department of Health maintains hospitals, health centres, clinics, care centres, and nursing services. The Hawaiian Home Lands Commission controls the transfer of land use to qualified persons of Hawaiian ancestry for homesteading.

Cultural life. Hawaii's cultural milieu is the result of overlay after overlay of varied cultural groups. The force of the original culture remains evident in the islands, although the Hawaiian race has become diminished and diluted over the years through death and intermarriage.

Uniqueness of Hawaii's cultural heritage

Vestiges of New England culture remain, as do the cultures of the early Asian immigrants. With the advent of fifth-, sixth-, and seventh-generation descendants of Asian and Caucasian immigrants and the massive influx of Americans from all parts of the country, the cultural overlays have melded to form a uniquely Hawaiian culture.

Interest in the arts is high, and many distinguished artists, photographers, and performers have been native residents. Appreciation of classical, modern, and experimental art forms is manifest in attendance figures at galleries, concerts, legitimate theatre performances, and museums. Many ethnic groups preserve the traditions of their ancestors or combine or modify music and dance forms.

An assortment of cultural and scientific institutions in Hawaii provides a wide variety of opportunity for the appreciation and understanding of the fine arts, history, traditions, and sciences. The Bernice P. Bishop Museum, founded in 1889 in Honolulu, is a research centre and museum dedicated to the study, preservation, and display of the history, sciences, and cultures of the Pacific and its people. The Honolulu Academy of Arts, often called the most beautiful museum in the world, houses a splendid collection of Western art, including works by the late 19th- and early 20th-century masters Monet, van Gogh, Matisse, Gauguin, and Picasso. Its collection of Asian art is also one of the finest in the Western world. The active art, music, and drama departments in Hawaiian schools and colleges and at the University of Hawaii contribute to the expanding cultural life of Hawaii, while the state has several theatre organizations, professional and amateur. The Honolulu Symphony Orchestra performs concerts in Honolulu and on the other major islands. Its home is the Neal Blaisdell Center, a municipal theatre–concert-hall–arena complex, where touring opera companies and ballet troupes and musical artists of international renown also perform. Honolulu's Chamber Music Society gives a concert series each year.

Hawaii has two national parks—Hawaii Volcanoes, on the island of Hawaii, and Haleakala, on Maui, as well as the much-visited U.S.S. Arizona Memorial in Pearl Harbor. There are also many state and county parks, including the Waimea Canyon State Park on Kauai. Surfing originated in ancient Hawaii and is now practiced at some 1,600 recognized surf spots throughout the islands. There are also some 25 miles of beaches accessible to the public.

HISTORY

The early Hawaiians

The first inhabitants of Hawaii may have reached the islands as early as AD 400 from the Marquesas. Contact with and settlement by Tahitians began about AD 1000. Powerful classes of chiefs and priests arrived and established themselves, followed by conflicts, similar to the feudal struggles in Europe, with complicated land rights contributing to the disputes. The early Hawaiians lacked a written language, and their culture was entirely oral and rich in myth, legend, and practical knowledge, especially of animals and plant life. The material life of the islands was hampered by the lack of metal, pottery, or beasts of burden, but there was great skill in the use of wood, shell, stone, and bone, and the huge double and outrigger canoes were technical marvels. Navigational methods were well developed, and there was an elaborate calendar. Athletic contests encouraged warrior skills.

European discovery. Captain James Cook, the English explorer and navigator, is generally credited with having made the first European discovery of Hawaii; he first landed at Waimea, Kauai Island, on Jan. 20, 1778. Upon his return in the following year, he was killed during an affray with a number of Hawaiians at Kealakekua Bay.

The initial discovery by Cook was followed by a period of intermittent contact with the West. During this period Kamehameha I used European military technology and weapons to emerge as an outstanding Hawaiian leader, seizing and consolidating control over most of the island group. For 85 years thereafter, monarchs ruled over the Hawaiian kingdom. In the early 19th century the American whaling fleet began wintering in Hawaii, and the islands were visited with mounting frequency by explorers, traders, and adventurers. Captain George Vancouver introduced livestock to the islands in 1792. In 1820 the first of 15 companies of New England missionaries arrived. By the middle of the century there were frame houses, horse-drawn vehicles, schools, churches, taverns, and mercantile establishments. A written language had been introduced, and European and American skills and religious beliefs—Protestant and Roman Catholic—had been imported. Hawaiian culture was irrevocably changed.

Establishment of U.S. dominance. Political maneuvering between U.S., British, and French consuls and naval forces brought about uncertainty in the governmental situation. The foundations of constitutional government were nevertheless laid down with the promulgation, by Kamehameha III, of the Declaration of Rights (June 7, 1839), the Edict of Toleration (June 17, 1839), and a written constitution (Oct. 8, 1840). These progressive steps—made under missionary influence—were followed by formal avowals of Hawaiian independence by the United States, Great Britain, and France. The ambitions of these

powers continued unabated, however, with a succession of overt and covert diplomatic moves, culminating in the signing of a reciprocity treaty with the United States in 1875. The kingdom was overthrown in 1893, and a republic was formed with U.S. support. This was followed by the joint annexation resolution of Congress in 1898, the final stamp of U.S. domination. This status was confirmed by the establishment of a territory on June 14, 1900.

Overthrow of the kingdom

The period until 1940 was distinguished by a rapid growth in population, the development of a modern economy based on the production of sugar and pineapples for consumption on the U.S. mainland, and the growth of transport and military links. Movements for statehood, based in part on Hawaii's obligation to pay U.S. taxes without having corresponding legislative representation, began to emerge. The Japanese attack on Pearl Harbor, on Dec. 7, 1941, precipitated not only Hawaii but the United States as a whole into World War II, and the islands were beset by an upsurge of military activity and a sometimes controversial curtailment of civil liberties. The post-1945 period was marked by further economic consolidation and a long constitutional path to statehood, a status finally achieved in 1959.

Since statehood tourism has grown in Hawaii, with ever-increasing numbers of visitors, especially from Japan and the U.S. mainland. They are lured not only by the warm climate and exotic beauty of the islands but also by a growing number of world-class resorts, built on such a grand scale that they are destinations in themselves. In addition, new telescopes atop Mauna Kea are helping Hawaii become a major world centre of astronomy.

(J.P.M.S./L.S.M.)

Oregon

Admitted to the Union as the 33rd state on Feb. 14, 1859, Oregon comprises an area of startling physical diversity, from the moist rain forests, mountains, and fertile valleys of its western third to the naturally arid and climatically harsh eastern deserts. Mountains, plateaus, plains, and valleys of different geologic ages and materials are arrayed in countless combinations, including such natural wonders as the Columbia River Gorge, Oregon Caves National Monument, Crater Lake National Park, the majestic snow-covered peaks of the Cascade Range, and the

Samuel H. Boardman State Park, in the southwestern corner of Oregon.

"moon country" of central Oregon. The name Oregon is thought to be Indian in origin.

To the north of the state's 97,073 square miles (251,419 square kilometres) of land and inland water lies Washington, from which Oregon receives the waters of the Columbia River; to the east, Idaho, more than half of the border with which is formed by the winding Snake River and its Hells Canyon, the deepest gorge on the North American continent; to the south, Nevada and California, with which Oregon shares its mountain and desert systems; and, to the west, the Pacific Ocean, which produces the moderate climate of Oregon's western lands.

The forested mountains of western and northeastern Oregon have supplied the traditional core of the state's economy. Its many forest-product plants produce more than one-fifth of the nation's softwood lumber, much of its soft plywood, and large quantities of hardboard, pulp, and paper. Nationally, Oregon ranks first in the production of wood products. In addition, the multipurpose development of the Columbia River system provides huge quantities of electricity, water for irrigation and industry, shipping channels, and water for recreation. The heartland of Oregon, however, is the Willamette valley, containing the major cities of Portland, Eugene, and Salem (the capital) and a rich and diversified agriculture.

PHYSICAL AND HUMAN GEOGRAPHY

The land.   *Relief.* Oregon has nine major landform regions. Of them the forest-blanketed Coast Range, which borders the Pacific Ocean from the Coquille River northward, is the lowest. Its elevations are usually below 2,000 feet, but Marys Peak, southwest of Corvallis, reaches 4,098 feet (1,249 metres).

The Klamath Mountains, which extend from California, lie south of the Coast Range and west of the Cascades. Of ancient resistant rocks, they have had a complicated geologic history. They are higher and more rugged than the Coast Range and lack the north–south orientation. The Rogue River, bisecting the area, provides the major drainage. Thick forests grow on these mountains, which also contain rich mineral deposits.

The Willamette valley is essentially an alluvial plain produced by burying stream-modified lowland with enormous quantities of sediments brought down by tributary streams from the bordering mountains. The low, hilly areas in the central and northern portions are composed of resistant rocks. This valley contains the prime land of the state, and its soils support intensive agriculture.

Willamette valley

The Cascade Range forms a broad lava plateau. The wider western section is deeply eroded by numerous streams fed by heavy precipitation. The eastern section, less dissected, is crowned with a chain of volcanic peaks. Mount Hood, reaching 11,239 feet (3,428 metres) above sea level, is the highest peak in Oregon, and Mount Jefferson, rising to 10,497 feet (3,199 metres), is the second highest.

In the north central Oregon plateau, known as the Deschutes–Umatilla Plateau, a portion of the Columbia River basin, streams are entrenched and provide some bold relief. The areas lying between the streams are broad, little-dissected, smoothly rolling surfaces that provide the land for Oregon's large wheat ranches.

The Blue–Wallowa mountains comprise two highland masses in the northeastern part of the state. The name Blue Mountains refers to the eroded plateaus and ranges extending westward from the agriculturally important La Grande and Baker valleys. Basins and valleys, headquarters for large cattle ranches, are scattered through the Blue Mountains. The Wallowa Mountains, east of the La Grande and Baker valleys and near the Idaho border, contain the highest elevations in northeastern Oregon. They were heavily glaciated and display spectacular scenery.

The area of the High Lava Plains, or High Desert, is located south of the Blue Mountains and eastward from the Cascade Range. It is the youngest and least eroded of the landform regions of Oregon, but the smoothness of the surface is broken by cinder cones, buttes, and craters; other features include immaturity of erosion and localized interior drainage. Low precipitation, short and erratic growing seasons, and the absence of soil in many places

result in an arid landscape of skimpy vegetation, with the details of the surface features commonly visible.

The Great Basin of the Basin and Range Province to the south, which merges with the High Lava Plains, has long, narrow, asymmetrical fault block ranges that alternate with wide basins. Small volcanoes are numerous in the western portion, where pumice modifies surface runoff, vegetation, and land use. Irrigation agriculture is practiced in the Upper Klamath Lake area, and hay is grown with irrigation in a number of other basins and valleys, but most of this region is used by range livestock.

The Malheur–Owyhee Upland of southeastern Oregon is generally a high, warped plateau. It contains older lava and has been more eroded than the High Lava Plains. The major drainage system, the Owyhee River, has incised several notable canyons in an area locally called the Rimrock Country. Along the Snake River in the east central portion of the state there is highly productive irrigation agriculture to supplement livestock grazing.

Climatic variation

Climate. Oregon's climates range from equable, mild, marine conditions on the coast to continental conditions of dryness and extreme temperature in the interior. Location with respect to the ocean, prevailing wind and storm paths, and topography and elevation are the principal climatic control factors.

The narrow coastal area and the bordering mountain slopes are marine influenced. Temperatures are mild and equable: July temperatures average 57° to 60° F (14° to 16° C), January temperatures about 40° to 46° F (4° to 8° C). Summers are relatively dry but receive only half the sunshine possible; other seasons are cloudy and wet. Annual precipitation ranges from 60 to 120 inches (1,500 to 3,000 millimetres) or more.

The lowlands of the Willamette, Umpqua, and middle Rogue rivers are warmer in summer, slightly cooler in winter, and have less precipitation than the coast. July averages 67° to 72° F (19° to 22° C), with 65 to 70 percent of the possible sunshine; January averages about 40° F (4° C). The rainy season extends from October through April, with precipitation averaging 35 to 40 inches, except in the middle Rogue valley, where 20 to 25 inches are common.

The Cascade Range has copious winter precipitation, including phenomenal snow depth, and short, dry, sunny summers. Above 3,000 feet, January average temperatures are below 32° F (0° C). Snow begins to fall in October and remains through April, with large patches persisting until July. The higher peaks support snowfields and small glaciers throughout the year. July average temperatures range from 50° to 60° F (10° to 16° C).

The north central Oregon plateau receives 10 to 20 inches of precipitation annually. Distribution is fairly even, but the majority of the rainy days occur in winter. Summers are sunny, with July temperatures averaging 70° to 75° F (21° to 24° C). The brisk winters have considerable sunny weather, and January temperatures average 31° to 33° F (−1° to 1° C). The plateau area of central and southeastern Oregon has climatic characteristics similar to the north central plateau except for somewhat less precipitation and lower temperatures at higher elevations.

The Blue–Wallowa mountains have climates that vary with location. The intermontane basins and valleys are similar to the north central plateau, with colder winters, while the higher, exposed elevations receive heavy precipitation, much of it in the form of snow during winter.

Forested areas

Plant and animal life. Forests cover about 30,000,000 acres (12,000,000 hectares) of Oregon. In the eastern two-thirds of the state, ponderosa pine, large sagebrush, and western juniper predominate, along with various annual grasses and wildflowers. On the Blue–Wallowa mountains and the eastern slopes of the Cascades occur great stands of ponderosa pine in association with ground coverings of bitter brush, green manzanita, and herbaceous plants. The western slopes of the Cascade, Klamath, and Coast ranges are heavily forested with stands of Douglas fir, with varying degrees of undercover vines and intrusions of other tree growths depending on the age of the stand. In cleared areas of the damp coastal region are found alder and noncommercial deciduous growth. In the alpine zones of the mountains, larch, mountain hemlock, and alpine firs

occur in association, and mountain mahogany is found in the Blue Mountains.

Oregon's animal life is related to its climatic zones. Deer and elk flourish in less populated areas; antelope are found in the eastern high plateau; and bear and fox, in the mountain foothills. The lakes are breeding grounds for waterfowl and resting places for migratory birds.

Settlement patterns. At least five major patterns of land use emerge from the tangle of Oregon's natural landscapes and climates. The forested mountains—the Coast Range, the Cascades, the Klamath, and the Blue–Wallowas—show relatively little evidence of human habitation or modification except for the harvest pattern of clear-cutting in the Douglas fir region, the logging and forest-management roads, and scattered roadside homesites at lower elevations. Most of the few loggers live in the valley towns.

The western valleys, dominated by the Willamette, are Oregon's main centres of population, industry, and transportation. Most persons live close to well-populated centres. The nearly 1,300 wood-product plants that in 1947 were located in valley towns or up tributary valleys into the forested mountains had, by the late 20th century, dwindled to less than 300 large-scale sawmills, plywood plants, and pulp mills.

In the rolling, sparsely populated wheat country of north central Oregon, ranches commonly exceed 1,500 acres (600 hectares) in the eastern portion and double that size to the west, where wheat–fallow rotation is practiced. In regions of natural erosion alternate bands of crop and fallow occur. Farmsteads are widely separated, and owners often live in towns.

The growth of natural feed in open range country is relatively poor, and cattle scatter over enormous areas. There are fences, occasional watering places with metal tanks, and ranchsteads located at great distances from one another.

Most of the eastern Oregon towns except Pendleton lie in the area of irrigated agriculture, on the eastern slopes of the Cascades or near the Idaho border. Farming is highly mechanized.

The people. Oregonians are predominantly white and American-born. There are small populations of Hispanics, blacks, and Asians. American Indians make up about 1 percent of the population. Roman Catholics form the largest single religious denomination but make up only one-third of all religious adherents. Methodists, Baptists, Presbyterians, Disciples of Christ, Lutherans, and Mormons are other large religious denominations.

The people are unevenly distributed, the great majority living west of the crest of the Cascade Range in the Willamette valley. Nearly 60 percent of all Oregonians live in three metropolitan areas, Portland, Eugene, and Salem. Portland, near the confluence of the Willamette and Columbia rivers and the largest city in the state, is a leading West Coast port and the major commercial, industrial, service, and cultural centre of the state. Eugene and Salem, the second and third largest cities, respectively, are important for trade and processing. Salem, the state capital, is among the nation's leading food-processing centres. The major cities outside the Willamette valley are Medford, in the Rogue valley; Klamath Falls, in south central Oregon; and Pendleton, in the north central plateau.

Metropolitan areas

The economy. Traditionally, Oregon has had a resource-oriented economy, strongly dependent upon its forests and farms. Through diversification, however, various new industries have been established and tourism, recreation, and trade and service activities have grown.

Industry. Forest-product manufacturing is Oregon's leading industry. About one-half the land area of the state is forested, and nearly 40 percent produces commercial timber. Public agencies control about 60 percent of Oregon's commercial forest, and private owners the remaining 40 percent. Additional forest is reserved for wilderness preservation, recreation, and other exclusionary uses.

The forest industry began as a producer of lumber: since 1938 Oregon has ranked first in softwood lumber. Products have changed, however, and by the late 20th century only 40 percent of the forest income was from lumber. More than one-third of the logs harvested go into ply-

wood, which accounts for about one-third of the value of forest products. Pulp and paper plants and hardboard and particleboard plants contribute most of the remainder.

Metals-related industries—primary metals, fabricated metals, and transportation equipment—were the pace-setters after World War II. They have been replaced by high-technology industries—machinery, electrical equipment, and instruments—as the major growth factor. The greatest concentration of metals-related industries is in the Portland metropolitan area. The high-technology industries are in Portland and the Willamette valley.

Agriculture and fishing. The agricultural land base of Oregon includes both cropland and pastures and range-land. Livestock products contribute one-third of the total commodity value, led by cattle and calves; dairy and poultry products are also significant. Wheat is the leading crop, but potatoes, barley, pears, apples, and grapes for wine are also important.

Major
crops

Chinook, silver, chum, and pink salmon and shellfish are the most valuable fishery products. Other fish include flounder, tuna, ocean perch, and rockfish.

Mining. In mining, stone and construction sand and gravel make up the bulk of the value. Quarrying occurs in every county, but the greatest quantities are taken near urban areas. The only integrated nickel mine and smelter in the nation is located near Riddle. Studies have shown that the state likely has additional extractable reserves.

Tourism. Tourism has become a major sector of Oregon's overall economy. Those coming to the state enjoy its scenery and myriad opportunities for recreation, including hiking, skiing, fishing, beachcombing, and windsurfing. Tourism supports the many small businesses that provide food, lodging, fuel, and other supplies and services.

Transportation. In addition to an extensive network of highways and roads under the jurisdiction of the state, the federal government, and counties and municipalities, Oregon has forest development roads, national park roads, and military and Indian reservation roads that are controlled by federal agencies and various local governments. Railroads provide north–south and east–west routes. The largest airport is Portland International Airport; other significant commercial airfields are at Eugene, Medford, Pendleton, Klamath Falls, and Redmond.

Throughout the state's history water transportation has been important. Six of the port districts are located on the Columbia above the head of deep navigation, where barge traffic is composed principally of grain and petroleum downstream and cement and structural steel upstream. Portland, open to oceangoing vessels, is by far the most important port. The other districts stretch along the Oregon coast and up the Columbia on the deep-draft channel. Portland, Astoria, Newport, and Coos Bay have regular shipments to and from foreign countries.

Administration and social conditions. *Government.* The state constitution was adopted in 1857. Oregon has been in the vanguard of several innovative movements in U.S. government collectively known as the Oregon System. In 1902 the concepts of initiative and referendum were introduced, by which voters are able to initiate and vote upon statutes or constitutional revisions; these were supplemented in 1908 by the system of recall, under which the removal of elected officials can be initiated by the voters. The state was also one of the earliest to impose a state income tax, which it did in 1923.

The
Oregon
System

State government in Oregon follows the pattern of most states. Limited to two four-year terms within any 12-year period, the governor supervises the state budget, coordinates the activities of state agencies, boards, and commissions, initiates future planning, and is the focus of federal-state interaction. The governor may also veto individual items in appropriation bills. The legislature comprises the Senate, with 30 members serving four-year terms, and the House of Representatives, with 60 members serving two-year terms.

The court system is headed by the seven-justice Supreme Court, which has general administrative authority over all other courts. The justices, elected for six-year terms, elect one of their members as chief justice.

Oregon gives its towns and cities home rule—that is, the right to choose their own form of government. Most cities with populations of more than 2,500 have the council-manager form of government, whereas smaller cities usually are governed by a city council and a mayor. Portland is governed by four commissioners and a mayor.

In 1958 a constitutional amendment authorized counties to adopt home-rule charters, and in 1973 a state law granted all counties the power to exercise broad home-rule authority. In most counties a county judge and two commissioners or a board of commissioners exercise the powers of government. These officials usually are elected for terms of three years.

Oregon's budget includes general fund revenue derived from personal and corporate income, excise, inheritance, and insurance taxes and from liquor sales and other fund revenue derived from federal grants, use taxes, trust funds, licenses, and the sale of services and commodities. In 19⁷1 the legislature passed a far-reaching program to deal with the problem of air and water pollution, and in 1973 a mandatory program of land and resource development and conservation was established.

Republicans dominated Oregon's politics through much of the state's history. With post-World War II industrial and population growth, however, Democrats came to outnumber Republicans in registration. An unusual number of Oregonians have made their mark in the U.S. Congress by their independent stances.

Education. The first free public school system was created by the territorial legislature in 1849. In 1951 the legislature established a board of education, appointed by the governor. The constitution provides for an elected superintendent of public instruction.

Opportunities for education after high school are provided by community colleges, a state system of higher education composed of three universities (the University of Oregon, Oregon State University, and Portland State University), three regional colleges, two specialized schools, and several private colleges. The community colleges are administered by lay boards, supported by local taxes, and responsive to local needs in their curricula. Private colleges include Reed College (1909) in Portland, Willamette University (1842) in Salem, and Lewis and Clark College (1867) in Portland.

Colleges
and
universities

Health and welfare. The Department of Human Resources coordinates the activities of the state's principal social service agencies. More than 250 programs provide service directly to citizens. The Oregon Health Sciences University, located in Portland, includes schools of medicine, dentistry, and nursing, hospitals and outpatient clinics, and other facilities. The university's Institute for Advanced Biomedical Research was one of the world's first centres to focus on study of the molecular biology of the brain.

Cultural life. As a relatively young state and one in which the human imprint is scarcely visible over vast stretches of land, Oregon has not developed a cultural identity equivalent to those of the longer settled or more heavily populated regions. Its people, however, no less in the sparsely settled areas of the east than in the population centres of the Willamette valley, take full part in the increasingly homogeneous character of American life. Portland has large auditoriums and a coliseum. Theatrical and musical groups are found in all of the cities and larger towns, and the Oregon Shakespearean Festival in Ashland draws thousands of viewers each summer. University and college communities have public offerings in the arts and other cultural activities.

The
cultural
milieu

In addition to sporting events, both spectator and participatory, Oregon has a number of attractions related to its history and location. These include the Pendleton Round-Up, which attracts participants from across the West; Albany's World Championship Timber Carnival, which takes place each July 4 and features logger events, carnivals, and a parade; and Portland's Rose Festival in early June.

The Multnomah County Library, in Portland, was the first to serve the public on a large scale; it began membership service in 1864 and free service in 1902. The Oregon State Library in Salem maintains a general reference service and loan collection.

The Oregon Historical Center in Portland and the Horner Museum at Oregon State University own large collections of items from pioneer days in the Oregon country. The Oregon Museum of Science and Industry in Portland features demonstrations of science at work in Oregon industries. The Portland Art Museum features Northwest Coast Indian art and pre-Columbian art in its collection. The Murray Warner Collection of Oriental Art at the University of Oregon has one of the largest Asian collections in the United States. The High Desert Museum, in Bend, has living exhibits of plants and animals native to the arid region of the Pacific Northwest.

HISTORY

When the first Europeans arrived in the Oregon country— a region vaguely defined at the time but roughly comparable to the present Pacific Northwest—about 125 Indian tribes with a population estimated at 100,000 to 180,000 lived in and around the area. In what became the state of Oregon, the leading tribes were the salmon-eating Chinook along the lower Columbia River; the Tillamook, Yamel, Molala, Clackamus, and Multnomah in the northwest; the Santiam and Coos in the southwest; the Cayuse, Northern Paiute, Umatilla, Nez Percé, and Bannock in the dry lands east of the Cascade Range and in the Blue–Wallowa mountains; and the Klamath and Modoc in the south central area. Their mode of life resulted in a relatively small population: they had no form of agriculture and no domesticated animals other than the dog; and they used crude implements for gathering, hunting, and fishing. The tribes along the Columbia River, known as the Canoe Indians, fashioned excellent canoes from logs.

The explorers. The first Europeans to see the Oregon coast were Spanish sailors searching for a northwest passage. In 1579 English pirate Francis Drake, in quest of Spanish loot and a northwest passage in his *Golden Hind,* anchored in an inlet north of the Golden Gate and with a brass plate "took possession" of the country for Queen Elizabeth I. Until the third quarter of the 18th century, when the Spanish renewed exploration along the coast, the Oregon country remained unexplored. In 1778 the English sea captain James Cook visited and traded in Oregon.

In 1787 Boston merchants sent two ships to the Oregon country under Captains Robert Gray and John Kendrick. On his second voyage Gray entered the harbour that bears his name (in Washington), and in May 1792 he sailed over the bar of the Columbia River and named it for his ship, the *Columbia.* This was the first U.S. claim to the Pacific Northwest by right of discovery.

The Northwest was also approached by land. Two British fur companies, the Hudson's Bay Company and the North West Company, raced across the continent to open routes to the Pacific; the Americans were not far behind. Meriwether Lewis and William Clark reached the mouth of the Columbia in 1805, strengthening the U.S. claim to the region. John Jacob Astor, at the head of the Pacific Fur Company, began white settlement of the Oregon country with the establishment of a trading post at Astoria in 1811. In 1824 the Hudson's Bay Company established Fort Vancouver, and John McLoughlin was appointed to head this company's far-flung operations. For the next 22 years he was the dominating figure in the region.

Permanent settlement. Beginning in 1830, thousands of people from the Midwest migrated to the Pacific Northwest. Missionaries played a role in settlement. In 1834 the Methodists, headed by Jason Lee, established the first permanent settlement in the Willamette valley. The migrations that carved the deep wagon wheel ruts still visible in the Oregon Trail began in the early 1840s. After 1838 U.S. claims and rights to the region were constantly before Congress. Settlers in the Willamette valley made known their desire to become part of the United States. In 1843 representatives met at Champoeg to organize a provisional government; a set of laws patterned after those of Iowa was accepted. By 1844 the British government had concluded that the Columbia River boundary line would have to be abandoned, and the Hudson's Bay Company moved its chief Northwest depot to Fort Victoria. In spite of the "fifty-four forty or fight" slogan of the presidential

campaign of 1844, the 49th parallel was accepted by both nations as the boundary, and the Oregon country was added to the United States in 1846.

Statehood and growth. The influx of population led to political agitation, and in 1853 the Washington Territory was given independent status. Oregon became the 33rd state in 1859. By 1883, following several conflicts with whites, most of the Indians of Oregon had been moved to reservations. The same year a railroad linking Oregon with the rest of the nation was begun, which vastly improved the opportunity for economic growth. Agriculture and forestry were especially stimulated, and by the turn of the 20th century two-thirds of the people of Oregon lived in rural areas. During the 20th century, however, the cities grew rapidly, and by the late 20th century more than two-thirds of the people were living in urban areas. Land use planning and legislation have helped to preserve the state's environment. Since 1940 there has been diversification of the economy, including rapid growth in international trade, and a significant increase in the number of people emigrating to Oregon from other states.   (R.M.Hi.)

Washington

Admitted on Nov. 11, 1889, as the 42nd member state of the United States, Washington lies at the northwest corner of the 48 coterminous states. It is bounded by the Canadian province of British Columbia on the north, Idaho on the east, Oregon on the south, and the Pacific Ocean on the west. A coastal location and excellent harbours give the state a leading role in trade with Alaska, Canada, and countries of the Pacific Rim. Washington cities have sister cities in several countries, and their professional and trade associations commonly include Canadian members.

Washington's area of 68,139 square miles (176,479 square kilometres) is smaller than those of its border states, Idaho and Oregon, but it has the largest population of the three. Most of the people live in the metropolitan areas of Seattle–Everett and Tacoma and other cities along Puget Sound, including the state capital, Olympia.

The terrain and climate of Washington divide the state into a rainy western third and a drier eastern two-thirds in the rain shadow of the Cascade Range. Western Washington industries depend on agriculture, forests, and fisheries and imported raw materials, whereas eastern Washington is mainly agricultural, producing wheat, irrigated crops, and livestock.

PHYSICAL AND HUMAN GEOGRAPHY

The land. Relief. Washington has seven physiographic regions. In the northwest the Olympic Peninsula borders the Pacific Ocean south of the Strait of Juan de Fuca. Dense rain forests extend along the western slopes of the rugged Olympic Mountains, which rise to 7,965 feet (2,428 metres) on Mount Olympus.

The Willapa Hills parallel the coast from Grays Harbor to the Columbia River in the southwest. Gentle, forested slopes descend to an indented Pacific coastline and to the Chehalis and Cowlitz valleys on the north and east.

The Puget Sound Lowland stretches southward from Canada between the Olympic Mountains and the Cascade Range to join the Chehalis and Cowlitz valleys, which form an extension to the Columbia River. Deep waters and fine harbours in Puget Sound, together with relatively flat terrain along its shores, favour the densest population and greatest commercial development in the state.

The Cascade Range, east of the Puget Sound Lowland, has the state's highest elevations. Its chain of volcanic peaks includes 14,410-foot (4,392-metre) Mount Rainier, the fifth highest peak in the coterminous United States. Mount St. Helens, located in the Cascades near the Oregon border, erupted violently in 1980. The highest peaks have permanent glaciers.

The Columbia Basin occupies most of central Washington, surrounded by the Cascades to the west, the Okanogan Highlands to the north, uplands to Idaho on the east, and the Blue Mountains to the southeast. A basalt plateau, lying at about 1,000 to 2,500 feet above sea level, it is drained by the Columbia River and its main tributary, the

Bob and Ira Spring

Snake. Glaciation, flooding, and wind have shaped diverse landforms, although the general appearance is that of a large interior plain.

The Okanogan Highlands, in the northeast, are an extension of the Rocky Mountains. Their north–south ranges, with summits that rise to more than 7,000 feet (2,100 metres), are separated by glaciated trenches. Most of the state's metallic ores are found in this region.

The Blue Mountains, which extend into Washington from Oregon, consist of uplifted plateaus and ranges in the southeast corner of the state. Gentle slopes and broad valleys descend from 6,000-foot (1,800-metre) heights to the Columbia Basin. Outliers to the west comprise the Horse Heaven Hills and Rattlesnake Hills.

Soils. The most productive soils in Washington are those of the river floodplains and the weathered basalts and windblown silts of the Columbia Basin. In wetter areas acidic soils support forests, but the driest regions east of the Cascades have sparse plant life and require irrigation for agriculture. The fine-textured soils of the Big Bend and Palouse areas are susceptible to erosion by wind and water.

Climate. Prevailing westerly winds and the influence of the Pacific Ocean dominate the climate of Washington, although the Cascades barrier creates significant differences between western and eastern regions. The west has milder conditions than any part of the United States at the same latitudes. Seattle has an average January temperature of 41° F (5° C) and a 66° F (19° C) July average. Annual precipitation on the Pacific slopes of the Olympic Peninsula exceeds 150 inches (3,810 millimetres), but places on the northwest of the peninsula receive less than 20 inches (508 millimetres) a year. From the Puget Sound Lowland, where 30–40 inches are typical annual totals, amounts increase again to more than 100 inches in the Cascades.

East of the Cascade Range seasonal temperature variations are greater, but the Rocky Mountains to some extent shield the region from cold Canadian air masses in winter. Maximum summer temperatures usually exceed 100° F (38° C) a few days each year. Spokane's January average temperature is 25° F (−4° C); the July average is 70° F (21° C). Annual precipitation is 17 inches (430 millimetres) at Spokane but less than eight inches (200 millimetres) in the lower Yakima valley.

Throughout the state precipitation is greatest in the cooler months, when a succession of cyclonic storms move inland from the North Pacific, sometimes with gale-force winds. Rain falls on a great number of days even in areas that are relatively arid, such as in the west. The occasional outbreaks of continental air from the north or northeast may reach the outer coast, bringing freezing conditions in winter or hot, dry air that increases the danger of forest fires in summer.

Plant and animal life. Washington's 23,000,000 acres (9,308,000 hectares) of forest are among the most extensive in the United States. Major tree species are Douglas fir, hemlock, western red cedar, and ponderosa pine, found mainly in the mountain regions. On the semiarid parts of the Columbia Basin, grasses prevail, merging into sagebrush and other scattered shrubs in the driest areas.

Deer, elk, bears, mountain goats, and pumas (cougars) are among the large mammals, and there are also several fur-bearing animals. The Pacific flyway, a major route of North American waterfowl migration, follows the Puget Sound Lowland. Freshwater game fish include trout, bass, grayling, and sturgeon. Five species of Pacific salmon ascend western Washington streams to spawn. The coastal bays and Puget Sound are habitats for shellfish.

Settlement patterns. About three-fourths of Washington's people live in urban areas, principally in the Puget Sound Lowland. More than 50 percent live in the Seattle and Tacoma metropolitan areas. Spokane is the largest city east of the Cascades and the focus of the "inland empire," a large economic region of agriculture, forestry, and mining that reaches to northeastern Oregon, northern Idaho, western Montana, and southern British Columbia, Can. Smaller cities of eastern Washington include agricultural trade centres such as Wenatchee, Yakima, and Walla Walla. The Tri Cities area (Richland–Kennewick–Pasco) at the confluence of the Snake and Columbia rivers forms a transportation centre for irrigated agriculture, manufacturing, and the Hanford Site (an atomic energy installation).

Typical towns of the eastern wheat lands are crowned by grain elevators, whereas food processing plants are common in the towns that serve irrigated farms. Lumber towns and small mining settlements are found along the upland margins of the Columbia Basin.

The people. The early settlers, from the 1830s through the 1850s, came primarily from the Midwest along the Oregon Trail. Growth was slow until the 1880s, when railroads began to link Puget Sound and the Columbia River to the East and to California, ending the frontier era of the Pacific Northwest. The population of Washington grew fivefold from 1881 to 1890, to almost 360,000—and by 1920 it reached almost 1,360,000.

Immigration continued, particularly from the Midwest, and, until national quotas on foreign immigration of the 1920s, large numbers of foreign-born people entered the state, especially from Canada and the Scandinavian countries. The Japanese came late and by 1930 numbered about 18,000. During World War II, citizens or not, they were moved from the coastal areas to relocation camps in inland regions. After the war only a few received back their homes and property, and many chose to live elsewhere.

Washington has a relatively small percentage of blacks. It ranks among the top 10 states, however, in numbers of American Indians and Asians.

For decades the western movement of the nation's population dominated Washington's growth. During the 1950s, however, for the first time and by a wide margin, natural increase overtook immigration. Immigration has regained some of its former importance, but it remains below natural increase as a growth factor.

The economy. Agriculture, forestry, and fisheries have been major contributors to the state's economy since early settlement by Europeans. The rapid increase in manufacturing and services that began in the 1940s led to concentration of the population in urban areas. Nearly one-fifth of the nonagricultural labour force is employed in manufacturing; another one-fifth works for state or federal government agencies.

Resources. Water is Washington's most valuable and most versatile natural resource. The leading freshwater

(Marginal notes):
Cities of Washington

Differences between west and east

source is the series of dams on the Columbia River drainage system that impound water for irrigation, hydroelectric power, and flood control, while also providing for navigation, fisheries, recreation, and industrial uses. The Columbia and rivers of western Washington account for one-third of all hydroelectric production in the United States. Grand Coulee Dam, with a capacity of about 6,500,000 kilowatts, ranks among the largest power plants in the world. Groundwater resources are exploited for domestic use, industry, and limited irrigation in the Puget Sound Lowland and, to a lesser extent, along the main river valleys of the Columbia Basin.

Grand Coulee Dam

Forests support both wood-product industries and wildlife and recreation. Multiple use and sustained yield have been primary management objectives on both private and public forestlands since early in the 20th century. Commercial fisheries are another significant sector in the state's economy. Salmon, halibut, cod, and herring are the principal species landed at ports on Grays Habor, Willapa Bay, and Puget Sound. Developments in aquaculture supplement the harvest with salmon, trout, and shellfish.

Sand, gravel, and clay are the most valuable of the state's limited mineral products. Magnesite, lead, and zinc are produced in the Okanogan Highlands; and coal mining in the Cascades and Puget Sound Lowland has declined during the 20th century. An open-pit coal mine near Centralia provides fuel for a thermoelectric power plant.

Agriculture. Winter wheat is the state's leading crop and a major export from the Columbia Basin, which also grows barley, dry peas, lentils, and hay on dryland farms. Irrigated crops include potatoes, vegetables, fruits, hops, and mint. Washington markets more apples than any other state and is a major producer of pears, cranberries, and wine grapes. Vegetable seeds, berries, vegetables for canning or freezing, and flower bulbs are specialties of the Puget Sound Lowland.

Dairying is a leading rural industry of the northern Puget Sound Lowland, which is also noted for poultry. Beef cattle and sheep graze on the eastern grasslands and the open forestlands of mountain regions.

Farms vary from a few acres to hundreds of acres; since the mid-20th century the tendency has been toward larger and fewer farms. Former agricultural land near large cities has been converted to urban use at an increasing rate.

Manufacturing. For more than a century agriculture, forestry, fisheries, and mining have furnished materials for Washington's processing plants. By the mid-20th century, aircraft and aerospace production in the Seattle area rose to first place among the state's fabricating industries. U.S. Navy facilities on Puget Sound provide for construction and repair of ships; a major installation is the Trident Nuclear Submarine Base near Bremerton.

The state's several aluminum refineries depend on hydroelectricity and imported alumina to produce about one-fourth of the primary aluminum in the United States. Petroleum refineries on northern Puget Sound process Alaskan and foreign crude oil.

Tourism. Tourism has become a major source of income in Washington. The variety of scenic areas, including three national parks, draws increasing numbers of visitors to the state. Boating, hiking, skiing, sports events, and local festivals are other major tourist attractions.

Transportation. Harbours on Puget Sound and the outer coast afford year-round access to world ocean routes, and a state ferry system serves the San Juan Islands and Canada's Vancouver Island. Navigation locks allow boats to pass between Puget Sound and Lake Washington, at Seattle. Barges carry grain and raw materials along the Columbia–Snake route.

Ocean navigation

Airlines link the state's cities with one another and with transcontinental and world air routes. The Seattle–Tacoma Airport ranks among the leading U.S. airports in international passenger travel.

The state has a well-developed system of highways and interstate freeways. Pontoon bridges span Hood Canal on the Olympic Peninsula and Lake Washington at Seattle. Railways crisscross the state but rank behind trucks in freight transport. Pipelines move oil and natural gas from out-of-state and distribute refined products.

Administration and social conditions. *Government.* Washington's constitution of 1889, reflecting the distrust of government that was characteristic of the time, contained many restrictions on state power. One reflection of this was the creation of a divided executive. Unlike the federal executive branch, to which only the president and vice president are elected, the state has nine separately elected officials. The most important is the governor.

The legislature comprises the Senate of 49 members and the House of 98 members, elected, respectively, for four- and two-year terms. Important limitations on legislative powers include the earmarking of certain funds to specific purposes—*e.g.,* the gasoline tax to highways. Because the constitution prohibits a state income tax, Washington depends on more than one-half of its tax revenues from a general sales tax, which accounts for about 30 percent of the state's total income. Initiative and referendum on legislation and recall of elected officials give the voters a check on the legislature. The governor's power of "item veto" has been expanded to include all legislation, except referendums and initiatives, to the extent of eliminating lines in budget acts or sections of other laws.

The courts are divided into four levels. Courts of limited jurisdiction—justice, municipal, and police—are local and hear traffic cases, minor criminal and civil cases, and small-claims actions. Superior courts are general trial courts, having original jurisdiction in felonies and in civil cases not delegated to the limited courts. The Supreme Court and the appellate courts are almost solely courts of review. All judges, except for some classes of appointed municipal and police judges, are elected on nonpartisan ballots. Grand juries, created by a superior court, are used mainly to investigate political corruption, though their legal powers are considerably broader.

Washington's 39 counties are classified according to population by the legislature. The governing body in most counties is the board of county commissioners, whose three members act as both the chief executive officers and the legislative body for the county. The Optional Municipal Code was adopted in 1969, substantially expanding the powers of cities choosing to come under it. Cities with populations of 10,000 or more can adopt a home-rule charter if such a referendum is approved by the electorate, while municipalities of 300 to 10,000 are granted optional, noncharter home rule by statute.

Elections and political parties are regulated by state law. The unique feature of the nomination process in Washington is the "blanket primary," which replaced the closed primary in 1935, permitting citizens to vote for any candidate without disclosing their party membership. This law reflects a characteristic independence among the state's voters. Split voting has been reported by three-fourths of the voters in both primaries and final elections.

The blanket primary

Education. The State Board of Education sets general requirements of public school curricula, which are administered by an elected superintendent of public instruction and more than 300 district school boards. Attendance is required for children age eight through 16. Higher education is predominantly a state function, the largest institution being the University of Washington in Seattle, established in 1861. Washington State University at Pullman was founded in 1890 as a land-grant college for agricultural and mechanical arts. Three state colleges—at Bellingham, Ellensburg, and Cheney—evolved from teacher-training institutions in the 1890s to university status in 1977, and Evergreen State College at Olympia was added in 1971. A system of community colleges was combined under state administration in 1967. Several private, denominational institutions augment postsecondary opportunities.

Health and welfare. In 1936, responding to the Social Security Act of 1935, the state assumed broad responsibilities for welfare programs. The Department of Social and Health Services administers benefits for children, the aged, and families; it oversees both private and public medical services, including Medicaid. Washington ranks among the top 10 states in public aid to families with dependent children. Separate agencies provide aid to the blind and veterans. There are also commissions for Human Rights and Insurance Consumer Protection. An Employment

Security Department assists those who seek jobs and disburses unemployment insurance payments.

Cultural life. A young state, Washington has a Western and pioneering outlook. There is great interest among the people in archaeological explorations and the cultural patterns of the Indian inhabitants. Interdisciplinary field studies by scientists at Washington State University have discovered artifacts of two quite different archaeological sites. Marmes Rock Shelter, in arid eastern Washington, has yielded a 10,000-year sequence of tools left by hunters and gatherers along with some of the oldest well-documented skeletal remains in the Western Hemisphere. The Ozette site, on the Olympic Coast, has a unique collection of well-preserved clothing, basketry, and harpoons of people who fished and hunted seals and whales 500 years ago. Tools of a similar culture dating from 2,000 years ago were also found there. These and other sites in the state reflect the diverse cultural forms that evolved after prehistoric migrations from northeastern Asia.

The arrival of European settlers in the 19th century not only transformed the cultural landscape of Washington but also introduced new social patterns. Contemporary outdoor events usually are based on local history or economic pursuits. Rodeos (mainly in eastern Washington) and "old settlers reunions" recall early struggles to occupy the land. Agricultural fairs, ethnic festivals, blossom festivals, and parades exhibit products and skills. The annual Seattle Seafair features parades, boat races, and water carnivals. Water sports are popular on many lakes and rivers and especially on Puget Sound. Skiing is a favourite winter sport in the Cascades and Okanogan Highlands. Public forestlands, three national parks, and more than 125 state parks attract campers during the summer months.

Washington residents pursue a wide range of interests in the fine arts. The Seattle Symphony, Seattle Opera Association, and the Seattle Repertory Theater draw national attention. The School of Drama at the University of Washington pioneered modern arena staging. Several smaller cities have orchestras and drama groups. Among the approximately 25 major art galleries and museums, the Seattle Art Museum has extensive collections of Oriental art. The Thomas Burke Memorial Washington State Museum on the University of Washington's Seattle campus has an important collection relating to Pacific Northwest Indians. Also of interest are the Museum of History and Industry and the Pacific Science Center, both in Seattle. Among important historical museums is the Washington State Historical Society Museum in Tacoma.

The first library in the state, the Washington State Library in Olympia, traces its financial aid by the Congress to part of the Territorial Act of 1853. Rapid development of the public library system occurred in the first decade of the 20th century, when the Carnegie Foundation provided building funds. More than 250 libraries serve the state. Noteworthy are the two state university libraries, the Washington State Archives, and the Seattle Public Library.

HISTORY

The early frontier. When Europeans first explored the Washington area, they encountered a number of Indian tribes, the most prominent being the Chinook, the Coast Salish, the Nez Percé, and the Yakima. The early history of Washington and of the Northwest is intertwined with efforts to find the Northwest Passage, the development of the fur trade with the Orient, and the attempts of Roman Catholic and Protestant missionaries to convert the Indians. Spaniards had sailed along the coast earlier, but the wealth of sea otter skins secured from the Indians on one of the voyages of Captain James Cook in 1778 marked the start of real exploration and of the maritime fur trade. George Vancouver, sent by Britain in 1792, tried to find the Northwest Passage and to map the coast. Robert Gray was the first trader from the United States; his explorations resulted in the discovery of the Columbia River in 1792. By 1812, the United States almost completely dominated the fur trade. The British Hudson's Bay Company, however, maintained areas of dominance into the 1840s.

Missionaries were generally welcomed by the Indians, though often not so much for Christian salvation as for the knowledge and material advantages the whites could bring. Among the most famous missions were those of the medical missionary Marcus Whitman and the Reverend Henry Spalding, established in 1836 in southeastern Washington, and the Roman Catholic missions established by Pierre-Jean DeSmet in northeastern Washington.

The Protestant missionaries felt that white civilization was necessary for the Indian and thus encouraged white settlement. With the opening of the Oregon Trail the first large group, about 1,000 people, reached the Northwest in 1843. These and others following first went mainly into the Willamette valley of what became the state of Oregon, and later into the area north of the Columbia River (in present-day Washington), then still dominated by the Hudson's Bay Company. The Indians were initially receptive but the settlers' inconsistent dealings with the Indians led to such conflicts as the Cayuse War (1848–50), the Yakima War (1855–58), and the Nez Percé War (1877).

By the end of the 19th century most of the Indians had been settled on reservations, representing three principal tribal groups: Coast Salish, Interior Salish, and the Sahaptin. Anthropologists have identified numerous distinct tribes on the basis of language and other local cultural characteristics. Among the larger tribes of western Washington are the Makah, Quinault, Lummi, Snohomish, and Puyallup; tribes of eastern Washington include the Okanogan, Yakima, Klickitat, Kalispel, and Spokane.

Territory and state. Until the 1840s citizens of both the United States and Britain by agreement could settle and trade in what was still known as the Oregon country. In 1846 the two countries agreed on the present boundary between the United States and Canada, and in 1848 Congress established the Oregon Territory including all of the present-day states of Oregon, Washington, and Idaho and parts of Wyoming and Montana. This enormous area was difficult to govern from the territorial capital in the Willamette valley. As the population around Puget Sound grew, agitation arose to form a separate territory of the area north and west of the Columbia. In 1853 Congress created the Washington Territory—named for the first president of the United States—and extended it east of the Columbia River to the crest of the Rockies, including parts of present-day Idaho and Montana.

Different rates of population growth and difficulties of communication continued to cause problems, and various movements called for the creation of a separate territory in eastern Washington and even the creation of an independent Pacific Republic. In the 1870s and '80s the extension of the telegraph and the railroads to the Northwest strengthened ties with the United States, and attention turned to seeking statehood, granted in 1889.

Gold discoveries in the interior in the 1850s made Walla Walla the centre of eastern Washington for a time, but these were merely a prelude to Washington's role in provisioning the gold seekers who set out for the Alaskan and Yukon strikes of the late 1890s. The gold stimulated the trade of cities on Puget Sound, and the new prosperity was celebrated at the Alaska–Yukon Exposition in 1909.

Possibly the greatest stimulus to the state's progress in the 20th century was initiated by the development of the Columbia Basin and related projects, which greatly increased hydroelectric power and provided the basis for increased irrigation and flood control. A navigation improvement project was authorized as early as 1911, and work began on the Bonneville and Grand Coulee dams in 1933. Construction was completed on Bonneville in 1937 and on the main structure of Grand Coulee in 1941. The first two Grand Coulee power plants were completed in 1951, and a third power plant began operation in 1975.

Washington's prosperity and its growing role in the commerce of the Pacific were among the features celebrated in the Seattle World's Fair of 1962, named the Century 21 Exposition. Developments in the latter half of the 20th century were increased urbanization, consolidation of agricultural landholdings, improved transportation networks, and expanded trade with the Pacific Basin countries. Increasing concern for the environment led to a series of laws to regulate the impact of a growing population.

Establishment of Washington Territory

BIBLIOGRAPHY

Physical and human geography. *The land: (Landforms and geology)*: The standard work on the landform regions of the United States is WILLIAM D. THORNBURY, *Regional Geomorphology of the United States* (1965). WALTER SULLIVAN, *Landprints: On the Magnificent American Landscape* (1984), is a lively, authoritative, and well-illustrated treatment. An elementary, illustrated textbook is E.C. PIRKLE and W.H. YOHO, *Natural Landscapes of the United States*, 4th ed. (1985). NEVIN M. FENNEMAN, *Physiography of Western United States* (1931), and *Physiography of Eastern United States* (1938), are exhaustive and still standard references. WILLIAM L. GRAF (ed.), *Geomorphic Systems of North America* (1987), is a highly technical discussion. Recommended atlases include CHARLES O. PAULLIN, *Atlas of the Historical Geography of the United States* (1932, reprinted 1975); and GEOLOGICAL SURVEY (U.S.), *The National Atlas of the United States of America* (1970).

(Climate): STEPHEN S. VISHER, *Climatic Atlas of the United States* (1954, reprinted 1966), contains more than 1,000 maps. UNITED STATES NATIONAL OCEANIC AND ATMOSPHERIC ADMINISTRATION, *Climates of the United States*, 2nd ed., 2 vol. (1980), makes available physical and climatic data in narrative, tabular, and map form. Scholarly discussions are found in REID A. BRYSON and F. KENNETH HARE (eds.), *Climates of North America* (1974).

(Plant and animal life): An authoritative regional treatment of plant and animal ecology is VICTOR E. SHELFORD, *The Ecology of North America* (1963, reprinted 1978). MICHAEL G. BARBOUR and WILLIAM DWIGHT BILLINGS (ed.), *North American Terrestrial Vegetation* (1988), covers all major types. An ambitious cartographic attempt to correlate climate and natural vegetation is explained in ROBERT G. BAILEY (comp.), *Description of the Ecoregions of the United States* (1978).

(Human geography): A general text covering human geography is J. WREFORD WATSON, *North America, Its Countries and Regions*, rev. ed. (1967). D.W. MEINIG, *The Shaping of America*, vol. 1, *Atlantic America, 1492–1800* (1986), is indispensable for an understanding of the origins of America's human geography. JOEL GARREAU, *The Nine Nations of North America* (1981), is a lively, highly readable description of the emerging socioeconomic regions.

Landscape and land use: STEPHEN S. BIRDSALL and JOHN W. FLORIN, *Regional Landscapes of the United States and Canada*, 3rd ed. (1985), is a general introduction. JOHN R. STILGOE, *Common Landscape of America, 1580 to 1845* (1982), offers a valuable account of the early evolution of settlement. JOHN BRINCKERHOFF JACKSON, *Discovering the Vernacular Landscape* (1984), delves into the meaning of everyday man-made environments. The growth and development of America's cities and towns are detailed in ALEXANDER B. CALLOW, JR. (ed.), *American Urban History*, 3rd ed. (1982); and RICHARD LINGEMAN, *Small Town America: A Narrative History, 1620–the Present* (1980).   (P.F.L./W.Za.)

The people: The *Statistical Abstract of the United States*, published annually by the UNITED STATES BUREAU OF THE CENSUS, is the standard summary of statistics on the country's social, political, and economic composition. Interpretations of demographic data include EDWARD G. STOCKWELL, *Population and People* (1968); and RICHARD M. SCAMMON and BEN J. WATTENBERG, *The Real Majority* (1970). For an analysis of national values, a classic account is GUNNAR MYRDAL, *An American Dilemma: The Negro Problem and Modern Democracy*, 2 vol. (1944, reprinted 1975). Inquiries into the nature of American society include SEYMOUR MARTIN LIPSET, *American Exceptionalism: A Double-Edged Sword* (1996); and ROBERT D. PUTNAM, *Bowling Alone: The Collapse and Revival of American Community* (2000). Immigration is discussed in JOHN ISBISTER, *The Immigration Debate: Remaking America* (1996); and JOEL MILLMAN, *The Other Americans: How Immigrants Renew Our Country, Our Economy, and Our Values* (1997). OSCAR HANDLIN, *The Uprooted*, 2nd ed. enlarged (1973), covers the era of mass immigration, 1860–1920. Examinations of American minority groups include STEPHAN THERNSTORM (ed.), *Harvard Encyclopedia of American Ethnic Groups* (1980); and FRANK D. BEAN and W. PARKER FRISBIE (eds.), *The Demography of Racial and Ethnic Groups* (1978). Ethnic patterns are treated definitively in JAMES PAUL ALLEN and EUGENE JAMES TURNER, *We the People: An Atlas of America's Ethnic Diversity* (1988).   (O.H.)

The economy: JOHN AGNEW, *The United States in the World* (1987), analyzes the growth of regional economic blocs and their effects on the U.S. economy. ANTHONY S. CAMPAGNA, *U.S. National Economic Policy, 1917–1985* (1987), is a history of changes in America's economic policies over nearly 70 years. Aspects of the economy are treated in HOWARD F. GREGOR, *Industrialization of U.S. Agriculture* (1982), an atlas emphasizing aspects of U.S. industrialized farming, mainly from census information; ROBERT J. NEWMAN, *Growth in the American South* (1984), on

the shift of U.S. manufacturing to the Southern states in the 1960s and '70s; and RUTHERFORD H. PLATT and GEORGE MACINKO (eds.), *Beyond the Urban Fringe* (1983), essays on the vast land acreage outside U.S. metropolitan areas.

Administration and social conditions: The *United States Government Manual* (annual) offers a broad overview of the federal structure; while the *Congressional Quarterly Weekly Report* and *National Journal* (weekly) provide closer views of the public record of the federal legislature. *Congressional Quarterly's Guide to Congress*, 3rd ed. (1982), details the development and organization of Congress. See also *The Book of the States*, published biennially by the COUNCIL OF STATE GOVERNMENTS. DONALD R. WHITNAH (ed.), *Government Agencies* (1983), contains essays on the agencies' purposes and histories, with bibliographies. Discussions of election politics include FRED I. GREENSTEIN and FRANK B. FEIGERT, *The American Party System and the American People*, 3rd ed. (1985); the series by THEODORE H. WHITE, begun with *The Making of the President, 1960* (1961), which continued by covering subsequent presidential elections; and JACK P. GREENE (ed.), *Encyclopedia of American Political History*, 3 vol. (1984). ALEXANDER DeCONDE (ed.), *Encyclopedia of American Foreign Policy*, 3 vol. (1978), also contains useful bibliographies. NEAL R. PEIRCE and JERRY HAGSTROM, *The Book of America: Inside 50 States Today*, rev. and updated ed. (1984), is an insightful look at persistent social differences among various regions of the country.   (Ed.)

Cultural life: KIRK VARNEDOES and ADAM GOPNIK, *High & Low: Modern Art, Popular Culture* (1990), is an early attempt to address the "high and low" question unemotionally. ROBERT HUGHES, *American Visions: The Epic History of Art in America* (1997, reissued 1999), tries to use the broader social context now demanded to chronicle the ambitions and limitations of American art. Important "post-structuralist" views of American art are also offered by ARTHUR C. DANTO, *The Madonna of the Future: Essays in a Pluralistic Art World* (2001). The broader questions of the future of American culture in a time of multicultural transformation are engaged in many places, memorably in RICHARD RORTY, *Essays on Heidegger and Others* (1991). The debate over "political correctness" is examined in ROGER KIMBALL, *Tenured Radicals: How Politics Has Corrupted Our Higher Education*, rev. ed. (1998); DINESH D'SOUZA, *Illiberal Education: The Politics of Race and Sex on Campus* (1991); and ROBERT HUGHES, *Culture of Complaint: The Fraying of America* (1993). LOUIS MENAND, *The Metaphysical Club* (2001), attempts to track the crucial influence on American culture of America's most distinct philosophical movement, Pragmatism. The classic statement of the American vision in literary criticism is LIONEL TRILLING, *The Liberal Imagination* (1950, reissued 1976). See also LESLIE FIEDLER, *What Was Literature?* (1982), a radical egalitarian polemic against the division of American literature into "high" and "low" forms. EMORY ELLIOTT (ed.), *Columbia Literary History of the United States* (1988), covers the many aspects of American literature. DANIEL HOFFMAN (ed.), *Harvard Guide to Contemporary American Writing* (1979), is the best general introduction. Useful works on art include DORE ASHTON, *American Art Since 1945* (1982); IRVING SANDLER, *The Triumph of American Painting: A History of Abstract Expressionism* (1970, reissued 1982); and MILTON W. BROWN *et al., American Art* (1979). American dance is discussed in ARLENE CROCE, *Going to the Dance* (1982), and *Sight Lines* (1987); and EDWIN DENBY, *Dance Writings* (1986). For a history of America's unique contribution to the theatre arts, see GERALD BORDMAN, *American Musical Theater*, expanded ed. (1986). JAMES AGEE, *Agee on Film*, vol. 1, *Reviews and Comments* (1958, reprinted 1983), is still the most eloquent writing about American movies. STEPHEN MAMBER, *Cinema Verite in America: Studies in Uncontrollable Documentary* (1974), is a good introduction to alternative theories about alternative film. H. WILEY HITCHCOCK and STANLEY SADIE (eds.), *The New Grove Dictionary of American Music*, 4 vol. (1986), is an excellent starting point for research. GILBERT CHASE, *America's Music, from the Pilgrims to the Present*, rev. 3rd ed. (1987), is invaluable and readable. GEOFFREY C. WARD, *Jazz: A History of America's Music* (2000)—based on a film by Ken Burns—is a stimulating and serious history of America's most original art form. WHITNEY BALLIETT, *Collected Works: A Journal of Jazz* (2000), is a personal history of the achievements of Ellington and Armstrong.

                                                            (A.Go.)

History. *Discovery and exploration:* Useful introductions include SAMUEL ELIOT MORISON, *The European Discovery of America*, 2 vol. (1971–74); and DAVID B. QUINN, *North America from Earliest Discovery to First Settlements: The Norse Voyages to 1612* (1977).   (Ed.)

Colonial development to 1763: CHARLES M. ANDREWS, *The Colonial Period of American History*, 4 vol. (1934–38, reprinted 1964), is the starting point for an understanding of the structure of the British Empire in America. LAWRENCE HENRY GIPSON,

The British Empire Before the American Revolution, 15 vol. (1936–70), represents the culmination of the "British Imperial" school of interpretation. GARY B. NASH, *Red, White, and Black: The Peoples of Early America*, 2nd ed. (1982); and JACK P. GREENE and J.R. POLE (eds.), *Colonial British America* (1984), are excellent surveys. (*Settlement*): PERRY MILLER, *The New England Mind: The Seventeenth Century* (1939, reissued 1983), and a sequel, *The New England Mind: From Colony to Province* (1953, reissued 1967), together constitute perhaps the finest work of intellectual history ever written by an American historian. FRANCIS JENNINGS, *The Invasion of America* (1975); and JAMES AXTELL, *The European and the Indian* (1982), are important accounts of white-Indian relations. (*Imperial organization*): Useful surveys include MICHAEL KAMMEN, *Empire and Interest: The American Colonies and the Politics of Mercantilism* (1970); and STEPHEN SAUNDERS WEBB, *1676, the End of American Independence* (1984). (*The growth of provincial power*): JAMES A. HENRETTA, *The Evolution of American Society, 1700–1815* (1973), is an excellent survey of the American economic and political order. JACK P. GREENE, *Pursuits of Happiness* (1988), seeks to demonstrate the variety of colonial social developments. CARL BRIDENBAUGH, *Myths and Realities: Societies of the Colonial South* (1952, reprinted 1981), argues persuasively that the colonial South consisted of not one but three sections. RHYS ISAAC, *The Transformation of Virginia, 1740–1790* (1982), imaginatively surveys the social order of 18th-century Virginia. GARY B. NASH, *The Urban Crucible: Social Change, Political Consciousness, and the Origins of the American Revolution* (1979), surveys the growth of American cities in the 18th century. JOHN J. MCCUSKER and RUSSELL R. MENARD, *The Economy of British America, 1607–1789* (1985), is a good survey. (*Cultural and religious development*): DANIEL J. BOORSTIN, *The Americans: The Colonial Experience* (1958, reissued 1988), gives a brilliant, if overstated, account of American uniqueness. HENRY F. MAY, *The Enlightenment in America* (1976), provocatively examines American intellectual development. See also BROOKE HINDLE, *The Pursuit of Science in Revolutionary America, 1735–1789* (1956, reprinted 1974). ALAN HEIMERT, *Religion and the American Mind, from the Great Awakening to the Revolution* (1966), makes an important though polemical contribution to the understanding of the Great Awakening. (*America, England, and the wider world*): Overviews are found in FRANCIS PARKMAN, *A Half-Century of Conflict*, 2 vol. (1892, reprinted 1965); HOWARD H. PECKHAM, *The Colonial Wars, 1689–1762* (1964); and ALAN ROGERS, *Empire and Liberty: American Resistance to British Authority, 1755–1763* (1974).   (R.R.B.)

The American Revolution: (*Prelude to revolution*): BERNARD BAILYN, *The Ideological Origins of the American Revolution* (1967), examines the transmission of English republican ideology and its American reception. EDWARD COUNTRYMAN, *The American Revolution* (1985), considers American social history in the explanation of how American resistance developed. P.G.D. THOMAS, *British Politics and the Stamp Act Crisis* (1975), is a scholarly account of British objectives and methods, and his *The Townshend Duties Crisis* (1987) is the most comprehensive account of this episode. (*War of Independence*): JOHN R. ALDEN, *The American Revolution, 1775–1783* (1954, reprinted 1962), is distinguished for its political and military analyses. JACK P. GREENE (ed.), *The American Revolution* (1987), contains a valuable collection of essays. JERRILYN GREENE MARSTON, *King and Congress* (1987), studies how Congress acquired formal "legitimacy" in the course of rebellion. ROBERT MIDDLEKAUFF, *The Glorious Cause* (1982), examines the Revolution from a somewhat older point of view than is now fashionable. PIERS MACKESY, *The War for America, 1775–1783* (1964), explains the British side of the war. J.G.A. POCOCK (ed.), *Three British Revolutions: 1641, 1688, 1776* (1980), sets the American Revolution in the historical context of British experience. MORTON WHITE, *The Philosophy of the American Revolution* (1978), analyzes the concepts that took shape in the Declaration of Independence. JACK N. RAKOVE, *The Beginnings of National Politics* (1979), interprets the complex politics of the Continental Congress. Military histories include JOHN SHY, *Toward Lexington* (1965), on the British army in America; DON HIGGINBOTHAM, *The War of American Independence* (1971, reprinted 1985), shows the interrelationship of military and political developments; CHARLES ROYSTER, *A Revolutionary People at War* (1979, reissued 1981); and WILLIAM M. FOWLER, JR., *Rebels Under Sail* (1976), on the American navy.   (W.M.Wa./J.R.Po.)

The early federal republic: PETER S. ONUF, *The Origins of the Federal Republic* (1983), stresses the jurisdictional problems of relations among states and between states and the Confederation. GORDON S. WOOD, *The Creation of the American Republic, 1776–1787* (1969), provides a comprehensive "ideological" interpretation emphasizing the transformation of political thought into action. DAVID F. EPSTEIN, *The Political Theory of The Federalist* (1984); and the lengthy introduction to CECELIA M. KENYON, *The Antifederalists* (1966, reprinted 1985), are excel-

lent studies. JACKSON TURNER MAIN, *The Antifederalists: Critics of the Constitution, 1781–1788* (1961, reprinted 1974), analyzes the social origins and aspirations of the Anti-Federalists. JOYCE APPLEBY, *Capitalism and a New Social Order* (1984), argues that capitalism was seen as a liberating force by Jeffersonians as well as by Hamiltonians. Other studies of the period include GERALD STOURZH, *Alexander Hamilton and the Idea of Republican Government* (1970); JAMES M. BANNER, JR., *To the Hartford Convention: The Federalists and the Origins of Party Politics in Massachusetts, 1789–1815* (1970); JOHN ZVESPER, *Political Philosophy and Rhetoric* (1977); RICHARD HOFSTADTER, *The Idea of a Party System* (1969); NOBLE E. CUNNINGHAM, *The Jeffersonian Republicans* (1957), *The Process of Government Under Jefferson* (1978), and *The Jeffersonian Republicans in Power* (1963).   (J.R.Po.)

From 1816 to 1850: (*The Era of Mixed Feelings*): A comprehensive overview of the politics of this period is GEORGE DANGERFIELD, *The Era of Good Feelings* (1952, reprinted 1973). SHAW LIVERMORE, JR., *The Twilight of Federalism: The Disintegration of the Federalist Party, 1815–1830* (1962, reissued 1972), is an excellent analysis. GLOVER MOORE, *The Missouri Controversy, 1819–1821* (1953, reissued 1967), skillfully untangles that complex problem. (*Economic development*): Still valuable and informative are BRAY HAMMOND, *Banks and Politics in America, from the Revolution to the Civil War* (1957, reissued 1967); EDWARD PESSEN, *Most Uncommon Jacksonians: The Radical Leaders of the Early Labor Movement* (1967, reprinted 1970); and WALTER BUCKINGHAM SMITH, *Economic Aspects of the Second Bank of the United States* (1953, reissued 1969). (*Blacks, slave and free*): Particularly noteworthy studies are EUGENE D. GENOVESE, *Roll, Jordan, Roll: The World the Slaves Made* (1974); HERBERT G. GUTMAN, *The Black Family in Slavery and Freedom, 1750–1925* (1976); LEON F. LITWACK, *North of Slavery: The Negro in the Free States, 1790–1860* (1961, reprinted 1970); and IRA BERLIN, *Slaves Without Masters: The Free Negro in the Antebellum South* (1974, reissued 1981). (*Social and intellectual developments*): Lightly documented but brilliantly insightful is ALEXIS DE TOCQUEVILLE, *Democracy in America*, 2 vol. (1835; originally published in French, 1835), available in many later editions. EDWARD PESSEN, *Riches, Class, and Power Before the Civil War* (1973), challenges Tocqueville's version of equality in Jacksonian America. Other useful treatments are WILLIAM H. PEASE and JANE H. PEASE, *The Web of Progress: Private Values and Public Styles in Boston and Charleston, 1828–1843* (1985); BARBARA WELTER, *Dimity Convictions: The American Woman in the Nineteenth Century* (1976); RUSH WELTER, *The Mind of America, 1820–1860* (1975); MARTIN DUBERMAN (ed.), *The Antislavery Vanguard* (1965); and DAVID BRION DAVIS (comp.), *Ante-Bellum Reform* (1967). (*Jacksonian politics*): ARTHUR M. SCHLESINGER, JR., *The Age of Jackson* (1945, reissued 1953), is an influential study that stimulated a great array of refutations of its pro-Jackson interpretation, including EDWARD PESSEN, *Jacksonian America*, new ed. (1978, reprinted 1985). A stimulating if not always convincing comparison of Jacksonian and earlier America is ROBERT H. WIEBE, *The Opening of American Society: From the Adoption of the Constitution to the Eve of Disunion* (1984). RICHARD P. MCCORMICK, *The Second American Party System* (1966, reissued 1973), is an influential study. MICHAEL PAUL ROGIN, *Fathers and Children: Andrew Jackson and the Subjugation of the American Indian* (1975), is brilliant, original, and controversial. JOHN M. BELOHLAVEK, *Let the Eagle Soar!: The Foreign Policy of Andrew Jackson* (1985), fills a void in the Jacksonian literature. (*Expansionism*): BERNARD DE VOTO, *The Year of Decision, 1846* (1942, reissued 1989); and K. JACK BAUER, *The Mexican War, 1846–1848* (1974), are scholarly treatments.   (E.Pe.)

The Civil War: Syntheses of modern scholarship are JAMES M. MCPHERSON, *Ordeal by Fire* (1982); and J.G. RANDALL and DAVID DONALD, *The Civil War and Reconstruction*, 2nd ed. rev. (1969). ALLAN NEVINS, *Ordeal of the Union*, 8 vol. (1947–71), provides a comprehensive history. CLEMENT EATON, *A History of the Old South*, 3rd ed. (1975, reissued 1988), is a history of the region. Full, critical assessments of slavery are provided by KENNETH M. STAMPP, *The Peculiar Institution* (1956, reprinted 1978); and EUGENE D. GENOVESE (*op. cit.*). A perceptive account of the political conflicts of the late 1850s is ROY F. NICHOLS, *The Disruption of American Democracy* (1948, reissued 1967); while DON E. FEHRENBACHER, *The Dred Scott Case* (1978), offers an analysis of the constitutional issues. JEAN H. BAKER, *Affairs of Party* (1983), discusses the strong partisan attachments of ordinary citizens. JAMES M. MCPHERSON, *Battle Cry of Freedom* (1988), is a narrative history of the Civil War. Comprehensive coverage of the Confederate military effort in the East is DOUGLAS SOUTHALL FREEMAN, *Lee's Lieutenants, a Study in Command*, 3 vol. (1942–44, reissued 1970–72); while WARREN W. HASSLER, JR., *Commanders of the Army of the Potomac* (1962, reprinted 1979), does the same for the Federals. Studies of the war in the Mississippi valley include THOMAS L. CONNELLY,

Army of the Heartland: The Army of Tennessee, 1861–1862 (1967), and *Autumn of Glory: The Army of Tennessee, 1862–1865* (1971). An excellent examination of Gettysburg is EDWIN B. CODDINGTON, *The Gettysburg Campaign: A Study in Command* (1968, reissued 1984). VIRGIL CARRINGTON JONES, *The Civil War at Sea,* 3 vol. (1960–62), describes the naval war.
(D.H.D./W.W.H.)

Reconstruction: Excellent syntheses of scholarship on the Reconstruction period are REMBERT W. PATRICK, *The Reconstruction of the Nation* (1967); JOHN HOPE FRANKLIN, *Reconstruction* (1961); and KENNETH M. STAMPP, *The Era of Reconstruction, 1865–1877* (1965, reprinted 1975). The fullest account of blacks' experience in the postwar years are LEON F. LITWACK, *Been in the Storm So Long: The Aftermath of Slavery* (1979); and ERIC FONER, *Reconstruction: America's Unfinished Revolution, 1863–1877* (1988). C. VANN WOODWARD, *Reunion and Reaction* (1951, reissued 1966), covers behind-the-scenes political and economic negotiations in the disputed 1876–77 election. A definitive account of the South in the post-Reconstruction era is C. VANN WOODWARD, *Origins of the New South, 1877–1913* (1951, reissued 1971). Important studies of postwar race relations include C. VANN WOODWARD, *The Strange Career of Jim Crow,* 3rd rev. ed. (1974, reissued 1982); and JOEL WILLIAMSON, *The Crucible of Race* (1984).   (D.H.D.)

The transformation of American society, 1865–1900: (*National expansion*): A comprehensive study of the American "frontiers" of the period is HAROLD E. BRIGGS, *Frontiers of the Northwest: A History of the Upper Missouri Valley* (1940, reissued 1950). WALTER PRESCOTT WEBB, *The Great Plains* (1931, reprinted 1981), is a scholarly classic; see also RAY ALLEN BILLINGTON and MARTIN RIDGE, *Westward Expansion,* 5th ed. (1982); and ROD-MAN W. PAUL, *The Far West and the Great Plains in Transition, 1859–1900* (1988). HENRY E. FRITZ, *The Movement for Indian Assimilation, 1860–1890* (1963, reprinted 1981), traces the development of this policy after the Civil War. Studies of the occupation of the Plains by the farmers are FRED A. SHANNON, *The Farmer's Last Frontier: Agriculture, 1860–1897* (1945, reprinted 1977); and GILBERT C. FITE, *The Farmers' Frontier, 1865–1900* (1966, reissued 1987). (*Industrial development*): EDWARD C. KIRKLAND, *Industry Comes of Age* (1961), recounts development from the Civil War to 1897. SAMUEL P. HAYS, *The Response to Industrialism, 1885–1914* (1957), offers a perceptive appraisal of the impact of industry on American life. Discussion of the trade unions during the second half of the 19th century is NORMAN J. WARE, *The Labor Movement in the United States, 1860–1895* (1929, reprinted 1964). (*Politics*): SEAN DENNIS CASHMAN, *America in the Gilded Age: From the Death of Lincoln to the Rise of Theodore Roosevelt,* 2nd ed. (1988), provides an overview of the era. H. WAYNE MORGAN, *From Hayes to McKinley: National Party Politics, 1877–1896* (1969); and HAROLD U. FAULKNER, *Politics, Reform, and Expansion, 1890–1900* (1959, reissued 1963), are also valuable. Studies of populism include JOHN D. HICKS, *The Populist Revolt* (1931, reprinted 1981); and LAWRENCE GOODWYN, *Democratic Promise: The Populist Moment in America* (1976).   (H.W.Br./Ed.)

Imperialism, progressivism, and America's rise to power in the world, 1896–1920: (*American imperialism*): Varying interpretations of imperialism are presented by ERNEST R. MAY, *Imperial Democracy* (1961, reissued 1973); WALTER LAFEBER, *The New Empire: An Interpretation of American Expansion, 1860–1898* (1963); and RICHARD E. WELCH, JR., *Response to Imperialism: The United States and the Philippine-American War, 1899–1902* (1979). DAVID F. TRASK, *The War with Spain* (1981), is an account of the Spanish-American War. JULIUS W. PRATT, *America's Colonial Experiment* (1950, reissued 1964), discusses the administration of the American overseas empire. A. WHITNEY GRISWOLD, *The Far Eastern Policy of the United States* (1938, reissued 1966), remains the standard work; but, for the Open Door policy and relations with China, see also TYLER DENNETT, *John Hay: From Poetry to Politics* (1933, reissued 1963). The U.S. penetration and domination of the Caribbean is most authoritatively recounted in DANA G. MUNRO, *Intervention and Dollar Diplomacy in the Caribbean, 1900–1921* (1964, reprinted 1980). (*The Progressive era*): The best introduction to the United States during the Progressive era is JOHN WHITECLAY CHAMBERS II, *The Tyranny of Change* (1980); but ARTHUR S. LINK and RICHARD L. MCCORMICK, *Progressivism* (1983), is also valuable. (*The rise to world power*): An overview of the period is JOHN M. DOBSON, *America's Ascent: The United States Becomes a Great Power, 1880–1914* (1978). Surveys of American national politics from Roosevelt through Wilson are GEORGE E. MOWRY, *The Era of Theodore Roosevelt, 1900–1912* (1958, reprinted 1962); ARTHUR S. LINK, *Woodrow Wilson and the Progressive Era, 1910–1917* (1954, reprinted 1963); and ROBERT H. FERRELL, *Woodrow Wilson and World War I, 1917–1921* (1985). On the neutrality issue, see ERNEST R. MAY, *The World War and American Isolation, 1914–1917* (1959); and ARTHUR S. LINK, *Wilson,* 5 vol. (1947–65), especially the last three volumes. American

mobilization is well covered by DANIEL R. BEAVER, *Newton D. Baker and the American War Effort, 1917–1919* (1966); and NEIL A. WYNN, *From Progressivism to Prosperity: World War I and American Society* (1986). ARNO J. MAYER, *Political Origins of the New Diplomacy, 1917–1918* (1959, reissued 1970), and a sequel, *Politics and Diplomacy of Peacemaking: Containment and Counterrevolution at Versailles, 1918–1919* (1967), include a brilliant account of the development of Wilson's peace program in its worldwide context. The best study on Wilson and American diplomacy at the Paris peace conference is ARTHUR WALWORTH, *Wilson and His Peacemakers* (1986). For an account of the fight over the treaty in the United States, see WILLIAM C. WIDENOR, *Henry Cabot Lodge and the Search for an American Foreign Policy* (1980). WESLEY M. BAGBY, *The Road to Normalcy: The Presidential Campaign and Election of 1920* (1962), is an excellent study.   (A.S.L.)

From 1920 to 1945: GEOFFREY PERRETT, *America in the Twenties* (1982), gives extensive overviews of political, social, and cultural aspects of this period. A scholarly history is WILLIAM E. LEUCHTENBURG, *The Perils of Prosperity, 1914–32* (1958). NORMAN H. CLARK, *Deliver Us from Evil* (1976), provides a challenging revisionist history of Prohibition. FREDERICK LEWIS ALLEN, *Only Yesterday* (1931, reprinted 1986), is a contemporaneous account, covering all aspects of the years 1919–31; its companion volume is *Since Yesterday* (1940, reprinted 1986), on the 1930s. The standard account of politics in the 1930s is WILLIAM E. LEUCHTENBURG, *Franklin D. Roosevelt and the New Deal, 1932–1940* (1963). J.C. FURNAS, *Stormy Weather: Crosslights on the Nineteen Thirties* (1977), is a complete survey. IRVING BERNSTEIN, *Turbulent Years: A History of the American Worker, 1933–1941* (1969), is authoritative. GEOFFREY PERRETT, *Days of Sadness, Years of Triumph* (1973, reprinted 1985), comprehensively covers the war years 1939–45. JOHN MORTON BLUM, *V Was for Victory: Politics and American Culture During World War II* (1976), offers a critique of the war period. Military history is provided by KENNETH S. DAVIS, *Experience of War: The United States in World War II* (1965; also published as *The American Experience of War, 1939–1945,* 1967). A comprehensive study is I.C.B. DEAR and M.R.D. FOOT (eds.), *The Oxford Companion to World War II* (also published as *The Oxford Companion to the Second World War,* 1995). Civil and military history is discussed in WILLIAM L. O'NEILL, *A Democracy at War: America's Fight at Home and Abroad in World War II* (1993, reissued 1995).

From 1945 to the present: A general discussion of United States history since 1945 is MICHAEL SCHALLER, VIRGINIA SCHARFF, and ROBERT D. SCHULZINGER, *Present Tense: The United States Since 1945,* 2nd ed. (1996). A critical perspective is MELVYN DUBOFSKY and ATHAN THEOHARIS, *Imperial Democracy: The United States Since 1945,* 2nd ed. (1988). An overview of the early postwar years is JOHN PATRICK DIGGINS, *The Proud Decades: America in War and in Peace, 1941–1960* (1988). JAMES GILBERT, *Another Chance: Postwar America, 1945–1985,* 2nd ed. edited by R. JACKSON WILSON (1986), is a useful survey. Coverage of the Cold War is provided by RALPH B. LEVERING, *The Cold War, 1945–1987,* 2nd ed. (1988); and JOHN LEWIS GADDIS, *Strategies of Containment* (1982), a brilliant analysis of U.S. Cold War policies. BURTON I. KAUFMAN, *The Korean War* (1986), is a reliable overview. One of the most useful histories of the Civil Rights movement is TAYLOR BRANCH, *Parting the Waters: America in the King Years, 1954–1963* (1988). GEORGE C. HERRING, *America's Longest War: The United States and Vietnam, 1950–1975,* 2nd ed. (1986), is solid. WILLIAM L. O'NEILL, *Coming Apart: An Informal History of America in the 1960's* (1971), is a study of the quality of American life under the impact of changing social values. FREDERICK F. SIEGEL, *Troubled Journey: From Pearl Harbor to Ronald Reagan* (1984), analyzes the relationship between American social and cultural life and government policy. Lyndon Johnson is the subject of ROBERT DALLEK, *Lyndon Johnson and His Times,* 2 vol. (1991–98). An examination of American Cold War foreign policy is JOHN LEWIS GADDIS, *The Long Peace: Inquiries into the History of the Cold War* (1988, reprinted 1989).   (W.L.O'N.)

General state information: The series of guides written under the Works Progress Administration is an excellent source for information about many aspects of each state; many of these guides have been reprinted or revised. State atlases and historical atlases present graphically the settlement, development, and current condition of each state. Statistical abstracts and state yearbooks or directories ("blue books") are the best sources for data and for information on the political organization of each state. The triennial fact books for each state, published by Clements Research, give comprehensive county-by-county coverage—*e.g., Illinois Facts.* Books about place-names in each state provide information on local history. Two historical series are good introductions: *The States and the Nation Series* and *A History of the American Colonies.* State historical journals publish current historical research.

New England. *Connecticut:* THOMAS R. LEWIS and JOHN E. HARMON, *Connecticut: A Geography* (1986), is a concise treatment. DAVID M. ROTH (ed.), *Series in Connecticut History,* includes five separately titled volumes, all published in 1975. Bibliographies of historical sources include CHRISTOPHER COLLIER and BONNIE B. COLLIER, *The Literature of Connecticut History* (1983), definitive and thoroughly annotated; and ROGER PARKS (ed.), *Connecticut* (1986). BRUCE FRASER, *The Land of Steady Habits: A Brief History of Connecticut* (1988), is an easily read work written for the Connecticut Historical Commission on the 200th anniversary of statehood. (I.J.S./Ed.)

Maine: Maine's settlement, development, and current condition is presented graphically in GERALD E. MORRIS and RICHARD D. KELLY, JR. (eds.), *The Maine Bicentennial Atlas: An Historical Survey* (1976). RONALD F. BANKS, *Maine Becomes a State: The Movement to Separate Maine from Massachusetts, 1785–1820* (1970), is a scholarly treatment of this important period. KENNETH T. PALMER, G. THOMAS TAYLOR, and MARCUS A. LIBRIZZI, *Maine Politics & Government* (1992), describes Maine's political heritage and political system. A useful introduction to the state's history is CHARLES E. CLARK, *Maine* (1977, reprinted 1990). JOHN D. HASKELL, JR. (ed.), *Maine* (1977, reprinted 1983), is a useful bibliographic research guide. (J.N.C./Ed.)

Massachusetts: FEDERAL WRITERS' PROJECT OF THE WORKS PROGRESS ADMINISTRATION OF MASSACHUSETTS, *Massachusetts: A Guide to Its Places and People* (1937, reprinted as *The WPA Guide to Massachusetts,* 1983), details many aspects of the state; an updated version was also published as *Massachusetts: A Guide to the Pilgrim State,* 2nd ed., rev. and enlarged (1971). Geographic information may be found in RICHARD W. WILKIE and JACK TAGER (eds.), *Historical Atlas of Massachusetts* (1990). Historical works include ALBERT BUSHNELL HART (ed.), *Commonwealth History of Massachusetts,* 5 vol. (1927–30, reissued 1966), on the years 1605–1930; JACK TAGER and JOHN W. IFKOVIC (eds.), *Massachusetts in the Gilded Age* (1985); and MARTIN KAUFMAN, JOHN W. IFKOVIC, and JOSEPH CARVALHO III (eds.), *A Guide to the History of Massachusetts* (1988). JOHN D. HASKELL, JR. (ed.), *Massachusetts* (1976, reprinted 1983), is an extensive bibliographic work. (M.L.Cl.)

New Hampshire: General histories of New Hampshire include RONALD JAGER and GRACE JAGER, *New Hampshire: An Illustrated History of the Granite State* (1983); and NANCY COFFEY HEFFERNAN and ANN PAGE STECKER, *New Hampshire: Crosscurrents in Its Development,* updated ed. (1996). JOHN D. HASKELL, JR., and T.D. SEYMOUR BASSETT (eds.), *New Hampshire* (1979, reprinted 1983), lists more than 6,000 items on history and culture. (J.R.D.)

Rhode Island: GEORGE H. KELLNER and J. STANLEY LEMONS, *Rhode Island* (1982), provides a lively treatment of various historical topics. PATRICK T. CONLEY, *An Album of Rhode Island History, 1636–1986* (1986), is also useful. A well-written history of the state is WILLIAM G. MCLOUGHLIN, *Rhode Island, A History* (1986). ROGER PARKS (ed.), *Rhode Island* (1983), is an invaluable bibliographic reference. (M.I.W.)

Vermont: HAROLD A. MEEKS, *Time and Change in Vermont: A Human Geography* (1986), discusses both continuity and change. Information on geography and local history is presented in ESTHER MUNROE SWIFT, *Vermont Place-Names* (1977, reprinted 1996). CHARLES W. JOHNSON, *The Nature of Vermont: Introduction and Guide to a New England Environment,* new and expanded ed. (1998), combines history and natural history. RANDOLPH A. ROTH, *The Democratic Dilemma* (1987), is an in-depth look at social change in Vermont from 1791 to 1850. JOE SHERMAN, *Fast Lane on a Dirt Road: Vermont Transformed, 1945–1990* (1991), looks at the forces that changed Vermont's social and economic environment following World War II. T.D. SEYMOUR BASSETT (ed.), *Vermont* (1981), is an excellent bibliographic guide to history sources. (C.T.Mo./D.G.Sa.)

The Middle Atlantic region. *Delaware:* An overview of state history is JOHN A. MUNROE, *History of Delaware,* 4th ed. (2001). Specific periods are covered in C.A. WESLAGER, *The Delaware Indians: A History* (1972, reissued 1990); WILLIAM HENRY WILLIAMS, *Slavery and Freedom in Delaware, 1639–1865* (1996); PATIENCE ESSAH, *A House Divided: Slavery and Emancipation in Delaware, 1638–1865* (1996); and JOHN A. MUNROE, *Federalist Delaware, 1775–1815* (1954). (J.A.Mu.)

Maryland: A still useful atlas is RAYMOND, PARISH, PINE & PLAVNICK, *The State of Maryland Historical Atlas* (1973). Maryland's physical and human geography is discussed in EUGENE L. MEYER, *Maryland Lost and Found* (1986); and JAMES E. DILISIO, *Maryland* (1983). EARL ARNETT, ROBERT J. BRUGGER, and EDWARD C. PAPENFUSE, *Maryland: A New Guide to the Old Line State,* 2nd ed. (1999), includes much historical information. (Ja.H.B.)

New Jersey: An excellent source of information about many aspects of New Jersey is FEDERAL WRITERS' PROJECT, *New Jer-sey: A Guide to Its Present and Past* (1939, reissued as *WPA Guide to 1930s New Jersey,* 1989); a new, revised edition is also available, edited by LIDA NEWBERRY (1977). A general resource is MAXINE N. LURIE and MARC MAPPEN (eds.), *Encyclopedia of New Jersey* (2004). Geography and geology are covered in detail by CHARLES H. STANSFIELD, JR., *A Geography of New Jersey: The City in the Garden* (1998); PETER O. WACKER, *Land and People* (1975), on the preindustrial state; and PETER E. WOLFE, *The Geology and Landscapes of New Jersey* (1977). A historical treatment is THOMAS FLEMING, *New Jersey* (1977, reissued 1984). (P.O.W./Ed.)

New York: Physical features are described in JOHN H. THOMPSON (ed.), *Geography of New York State* (1966, reprinted 1977); and are represented graphically in NEW YORK DEPARTMENT OF TRANSPORTATION, *New York State Atlas,* 4th ed. (1998). Historical works include MILTON M. KLEIN (ed.), *The Empire State: A History of New York* (2001); DAVID M. ELLIS, *New York: State & City* (1979); and DAVID M. ELLIS, JAMES A. FROST, and WILLIAM B. FINK, *New York,* 5th ed. (1980). (P.J.Sc./Ed.)

Pennsylvania: A useful geographic reference work for Pennsylvania is DAVID J. CUFF et al. (eds.), *The Atlas of Pennsylvania* (1989). Particular cultural groups in Pennsylvania are discussed in JOHN A. HOSTETLER, *Amish Society,* 3rd ed. (1980); and WILLIAM T. PARSONS, *The Pennsylvania Dutch: A Persistent Minority* (1976). History is covered in RANDALL M. MILLER and WILLIAM PENCAK (eds.), *Pennsylvania: A History of the Commonwealth* (2002); and PHILIP S. KLEIN and ARI HOOGENBOOM, *A History of Pennsylvania,* 2nd enlarged ed. (1980).

(C.L.T./Ed.)

The South. *Alabama:* Useful reference works are DONALD B. DODD, *Historical Atlas of Alabama* (1974); and NEAL G. LINEBACK and CHARLES T. TRAYLOR, *Atlas of Alabama* (1973). VIRGINIA O. FOSCUE, *Place Names in Alabama* (1989), combines geography and local history. The state's history is chronicled in WILLIAM WARREN ROGERS et al. *Alabama: The History of a Deep South State* (1994). Historical discussions of race relations are provided in DIANE MCWHORTER, *Carry Me Home: Birmingham, Alabama, the Climactic Battle of the Civil Rights Revolution* (2001); PETER KOLCHIN, *First Freedom: The Response of Alabama's Blacks to Emancipation and Reconstruction* (1972); and ROBERT J. NORRELL, *Reaping the Whirlwind: The Civil Rights Movement in Tuskegee* (1985). (R.J.No./Ed.)

Arkansas: General information is provided in DIANN SUTHERLIN, *The Arkansas Handbook,* 2nd ed. (1996). Geographic, economic, historical, and social aspects are mapped in RICHARD M. SMITH (ed.), *The Atlas of Arkansas* (1989); and GERALD T. HANSON and CARL H. MONEYHON, *Historical Atlas of Arkansas* (1989). The different groups that make up Arkansas's population are analyzed in DAVID M. TUCKER, *Arkansas: A People and Their Reputation* (1985). Historical topics are examined in BEN F. JOHNSON III, *Arkansas in Modern America, 1930–1999* (2000); JAMES M. WOODS, *Rebellion and Realignment: Arkansas's Road to Secession* (1987); and C. CALVIN SMITH, *War and Wartime Changes: The Transformation of Arkansas, 1940–1945* (1986).

(B.A.D./Ed.)

Florida: General information sources include *The Florida Handbook* (biennial); BERNIE MCGOVER (ed.), *The Florida Almanac, 2004–2005,* 16th ed. (2004); and FEDERAL WRITERS' PROJECT, *Florida: A Guide to the Southernmost State* (1939, reprinted as *The WPA Guide to Florida,* 1984). ROBERT B. MARCUS and EDWARD A. FERNALD, *Florida: A Geographical Approach* (1975), is comprehensive. EDWARD A. FERNALD and ELIZABETH D. PURDUM (eds.), *Atlas of Florida,* rev. ed. (1996), provides a thorough survey. A study of the state's environment is MARJORY STONEMAN DOUGLAS, *The Everglades: River of Grass,* rev. ed. (1988). An excellent general history is CHARLTON W. TEBEAU and WILLIAM MARINA, *A History of Florida,* 3rd. ed. (1999). (R.H.Fu.)

Georgia: LAWRENCE R. HEPBURN (ed.), *Contemporary Georgia* (1987), is a good overview. A useful guide is KAP STANN, *Georgia Handbook,* 4th. ed. (2002). History is covered in BUDDY SULLIVAN, *Georgia: A State History* (2003); KENNETH COLEMAN (ed.), *A History of Georgia* (1977); HARVEY H. JACKSON and PHINIZY SPALDING (eds.), *Forty Years of Diversity: Essays on Colonial Georgia* (1984); and MICHAEL P. JOHNSON, *Toward a Patriarchal Republic: The Secession of Georgia* (1977).

(L.DeV./Ed.)

Kentucky: General geographic information may be found in KARL B. RAITZ, *The Kentucky Bluegrass* (1980); and WILFORD A. BLADEN, *A Geography of Kentucky* (1984). A useful resource is RICHARD ULACK, KARL RAITZ, and GYULA PAUER (eds.), *Atlas of Kentucky* (1998). The state's history is examined in LOWELL H. HARRISON and JAMES C. KLOTTER, *A New History of Kentucky* (1997). (W.A.Bl./Ed.)

Louisiana: FRED B. KNIFFEN and SAM BOWERS HILLIARD, *Louisiana,* rev. ed. (1988), provides a concise cultural geography.

CHARLES ROBERT GOINS and JOHN MICHAEL CALDWELL, *Historical Atlas of Louisiana* (1995), concentrates on historical geography. Louisiana's political system is discussed in WAYNE PARENT, *Inside the Carnival: Unmasking Louisiana Politics* (2004). MARK T. CARLETON, PERRY H. HOWARD, and JOSEPH B. PARKER (comps.), *Readings in Louisiana Politics,* 2nd ed. (1988), provides classic statements of social, economic, and political history. Creole history is provided in GLENN R. CONRAD (ed.), *The Cajuns,* 3rd ed. (1983); and SYBIL KEIN (ed.) *Creole: The History and Legacy of Louisiana's Free People of Color* (2000). Sources on all aspects of Louisiana history can be found in FLORENCE M. JUMONVILLE (comp.), *Louisiana History: An Annotated Bibliography* (2002).   (P.H.H./Ed.)

Mississippi: An overview is JAMES V. SULLIVAN and KATHLEEN SULLIVAN, *Mississippi: The Land, the People* (1994). A comprehensive history is RICHARD AUBREY McLEMORE (ed.), *A History of Mississippi,* 2 vol. (1973). Slavery is the subject of DAVID J. LIBBY, *Slavery and Frontier Mississippi, 1720–1835* (2004).   (Ed.)

North Carolina: A useful reference is DOUGLAS M. ORR, JR., and ALFRED W. STUART (eds.), *The North Carolina Atlas* (2000). Introductions to North Carolina's history include LINDLEY S. BUTLER and ALAN D. WATSON (eds.), *The North Carolina Experience* (1984); and WILLIAM S. POWELL, *North Carolina Through Four Centuries* (1989). Plantations and slavery are examined in JEFFREY J. CROW, *The Black Experience in Revolutionary North Carolina* (1977).   (D.G.M./Ed.)

South Carolina: CHARLES F. KOVACIK and JOHN J. WINBERRY, *South Carolina* (1987), discusses historical and economic geography. An overview of the state's history is WALTER EDGAR, *South Carolina: A History* (1998). Period treatments include ERNEST McPHERSON LANDER, *A History of South Carolina, 1865–1960,* 2nd ed. (1970); and ROBERT M. WEIR, *Colonial South Carolina: A History* (1983, reissued 1997).   (J.J.W./Ed.)

Tennessee: Basic physical geography is discussed in RALPH O. FULLERTON and JOHN B. RAY (eds.), *Tennessee* (1977); and EDWARD T. LUTHER, *Our Restless Earth: The Geologic Regions of Tennessee* (1977). WILMA DYKEMAN, *Tennessee* (1975, reissued 1993), is an introduction. A compendium of useful articles on the history of Tennessee is CARROLL VAN WEST (ed.), *Tennessee History: The Land, the People, the Culture* (1992, reissued 1998). The period from 1700 to 1840 is the subject of JOHN R. FINGER, *Tennessee Frontiers, Three Regions in Transition* (2001).   (S.McC.H./Ed.)

Virginia: Local history and geography are combined in JAMES HAGEMANN, *The Heritage of Virginia: The Story of Place Names in the Old Dominion* (1986); and EMILY J. SALMON and EDWARD D.C. CAMPBELL, JR. (eds.), *The Hornbook of Virginia History: A Ready-Reference Guide to the Old Dominion's People, Places, and Past,* 4th ed. (1994). EDMUND S. MORGAN, *American Slavery, American Freedom: The Ordeal of Colonial Virginia* (1975), analyzes the social basis of early Virginian political thought. Various periods in the state's past are described in WARREN M. BILLINGS, JOHN E. SELBY, and THAD W. TATE, *Colonial Virginia* (1986); VIRGINIUS DABNEY, *Virginia, the New Dominion* (1971, reprinted 1983); and PARKE ROUSE, *Virginia* (1966).   (C.L.Q./Ed.)

West Virginia: A dated but still useful resource on the state's physical features is RAYMOND E. JANSSEN, *Earth Science: A Handbook on the Geology of West Virginia* (1964). Overviews of the state's history include OTIS K. RICE and STEPHEN W. BROWN, *West Virginia: A History,* 2nd ed. (1993); and JOHN ALEXANDER WILLIAMS, *West Virginia* (1976, reissued 1984). Also useful is JIM F. COMSTOCK, *West Virginia Heritage Encyclopedia,* 25 vol. (1976).   (S.E.C./Ed.)

The Midwest. *Illinois:* A good general work is A. DOYNE HORSLEY, *Illinois: A Geography* (1986). R. DAN NEELY and CARLA G. HEISTER (comps.), *The Natural Resources of Illinois* (1987), contains information on climate and biological and geologic features. Geography and history are combined in JAMES N. ADAMS (comp.), *Illinois Place Names,* ed. by WILLIAM E. KELLER (1968, reissued 1989). Illinois literary figures are profiled in ILLINOIS STATE LIBRARY, *Illinois Authors* (1983). Illinois history is detailed in ROBERT P. HOWARD, *Illinois* (1972). A reference guide is ELLEN M. WHITNEY (comp.), *Illinois History: An Annotated Bibliography,* ed. by JANICE A. PETTERCHAK and SANDRA M. STARK (1995).   (R.T.L./V.D.S./Ed.)

Indiana: Overviews of Indiana history include DWIGHT W. HOOVER and JANE RODMAN, *A Pictorial History of Indiana* (1980); and JAMES H. MADISON, *The Indiana Way: A State History* (1986). The state's early history is explored in ANDREW R.L. CAYTON, *Frontier Indiana* (1996, reissued 1998). The series *History of Indiana* offers detailed coverage of various periods.   (Ed.)

Iowa: WAYNE I. ANDERSON, *Geology of Iowa: Over Two Billion Years of Change* (1983), analyzes the natural resources of

Iowa, as well as the geologic processes that have formed the landscape. TOM C. COOPER and NYLA SHERBURNE HUNT (eds.), *Iowa's Natural Heritage* (1982), examines the state's natural history. STEPHEN WILBERS, *The Iowa Writers' Workshop: Origins, Emergence, & Growth* (1980), traces the development of this creative writing program. Overviews of state history include LELAND L. SAGE, *A History of Iowa* (1974, reissued 1987); and DOROTHY SCHWIEDER, *Iowa: The Middle Land* (1996).   (N.E.S./Ed.)

Kansas: A guide to Kansas geology is REX C. BUCHANAN (ed.), *Kansas Geology* (1984). JOSEPH T. COLLINS (ed.), *Natural Kansas* (1985), recounts the state's natural history. Histories of Kansas include CRAIG MINER, *Kansas: The History of the Sunflower State 1854–2000* (2002); ROBERT W. RICHMOND, *Kansas, a Land of Contrasts,* 4th ed. (1999); CRAIG MINER, *West of Wichita: Settling the High Plains of Kansas, 1865–1890* (1986); and SCOTT G. McNALL, *The Road to Rebellion: Class Formation and Kansas Populism, 1865–1900* (1988).   (C.G.P./Ed.)

Michigan: The state's physical features are described in LAWRENCE M. SOMMERS, *Michigan* (1984); and RICHARD A. SANTER, *Michigan, Heart of the Great Lakes* (1977). Useful general histories include RICHARD J. HATHAWAY (ed.), *Michigan: Visions of Our Past* (1989); BRUCE A. RUBENSTEIN and LAWRENCE E. ZIEWACZ, *Michigan,* 2nd ed. (1995); and WILLIS F. DUNBAR, *Michigan: A History of the Wolverine State,* 3rd rev. ed. by GEORGE S. MAY (1995).   (Ri.J.H./Ed.)

Minnesota: PATRICIA CONDON JOHNSTON, *Minnesota: Portrait of the Land and Its People* (1987), is an illustrated overview. Physical features are described in RICHARD W. OJAKANGAS and CHARLES L. MATSCH, *Minnesota's Geology* (1982). JUNE DRENNING HOLMQUIST (ed.), *They Chose Minnesota: A Survey of the State's Ethnic Groups* (1981), covers the years from 1850 to 1980. MARY ANN GROSSMANN and TOM THOMSEN (eds.), *The Minnesota Almanac, 1988,* 3rd ed. (1987), compiles statistics on a variety of subjects. An overview of the state's history is WILLIAM E. LASS, *Minnesota: A History,* 2nd ed. (1998). A useful reference is FRANK H. GILLE (ed.), *The Encyclopedia of Minnesota,* 3rd ed., 2 vol. (2000).   (N.C.G./Ed.)

Missouri: MILTON D. RAFFERTY, *Missouri* (1983), includes discussion of physical, economic, political, and cultural topics. RUSSEL L. GERLACH, *Settlement Patterns in Missouri* (1986), is a concise work. Historical treatments include LOUIS HOUCK, *A History of Missouri from the Earliest Explorations and Settlements Until the Admission of the State into the Union,* 3 vol. (1908; reissued 3 vol. in 1, 1971), the definitive history up to statehood; DUANE MEYER, *The Heritage of Missouri,* 3rd ed. (1982); and PAUL C. NAGEL, *Missouri* (1989).   (M.D.R./Ed.)

Nebraska: BRADLEY H. BALTENSPERGER, *Nebraska* (1985), offers an excellent treatment of the state's development. FREDERICK C. LUEBKE, "Nebraska: Time, Place, and Culture," in JAMES H. MADISON (ed.), *Heart Land: Comparative Histories of the Midwestern States* (1988), pp. 226–247, is the best interpretation. An illustrated history is FREDERICK C. LUEBKE, *Nebraska* (1995). Political processes are the concern of ROBERT W. CHERNY, *Populism, Progressivism, and the Transformation of Nebraska Politics, 1885–1915* (1981); and STANLEY B. PARSONS, *The Populist Context: Rural Versus Urban Power on a Great Plains Frontier* (1973). JAMES AUCOIN, *Water in Nebraska: Use, Politics, Policies* (1984), discusses development of water resources. A general history is JAMES C. OLSON and RONALD NAUGLE, *History of Nebraska,* 3rd ed. (1997).   (H.A.D./Ed.)

Ohio: STEPHEN OSTRANDER, *Ohio: A Bicentennial Portrait, 1803–2003* (2002), is a pictorial introduction. MICHAEL B. LAFFERTY (ed.), *Ohio's Natural Heritage* (1979), describes the state's natural history. Sources on the people, economy, and government include RAYMOND BORYCZKA and LORIN LEE CARY, *No Strength Without Union: An Illustrated History of Ohio Workers, 1803–1980* (1982); ANDREW R.L. CAYTON, *The Frontier Republic: Ideology and Politics in the Ohio Country, 1780–1825* (1986); and GEORGE W. KNEPPER, *Ohio and its People,* 3rd ed. (2003). A historical introduction is ANDREW R.L. CAYTON, *Ohio: The History of a People* (2002).   (G.W.Kn./Ed.)

North Dakota: FRANCIE M. BERG, *North Dakota,* rev. and updated (1989), is a valuable descriptive work. JOHN P. BLUEMLE, *The Face of North Dakota,* 3rd ed. (2000), is a sound introduction. WILLIAM C. SHERMAN and PLAYFORD V. THORSON (eds.), *Plains Folk: North Dakota's Ethnic History,* rev. and corrected ed. (1988), provides detailed information. MARY JANE SCHNEIDER, *North Dakota Indians* (1994), is the most comprehensive work of its kind. ELWYN B. ROBINSON, *History of North Dakota* (1966, reissued 1995), is the authoritative and exemplary history up to about 1960.   (B.O.'K./Ed.)

South Dakota: Overviews of the land and people include J. LEONARD JANNEWEIN and JANE BOORMAN (eds.), *Dakota Panorama,* 4th ed. (1988); and FRANCIE M. BERG, *South Dakota* (1982). HERBERT T. HOOVER and LARRY ZIMMERMAN (eds.), *South Dakota Leaders* (1989), is the best interpretative historical

volume. An introduction to the state's history is JOHN MILTON, *South Dakota* (1977, reissued 1988). HERBERT T. HOOVER and KAREN P. ZIMMERMAN (comps.), *South Dakota History* (1993), contains an annotated bibliography of sources on state history.
(H.T.H./Ed.)

Wisconsin: An overview of the state is ROBERT C. OSTERGREN and THOMAS R. VALE (eds.), *Wisconsin Land and Life* (1997). The state's features are discussed in GWEN M. SCHULTZ, *Wisconsin's Foundations: A Review of the State's Geology and Its Influence on Geography and Human Activity* (1986), a well-illustrated work for the nonspecialist; and INGOLF VOGELER, *Wisconsin* (1986). The state's history is the subject of WISCONSIN CARTOGRAPHERS' GUILD, *Wisconsin's Past and Present* (1998, reissued 2002), a historical atlas; WILLIAM FLETCHER THOMPSON (ed.), *The History of Wisconsin*, 6 vol. (1973–98); and ROBERT C. NESBIT and WILLIAM FLETCHER THOMPSON, *Wisconsin: A History*, 2nd ed. (1989). (R.W.F./Ed.)

The Southwest. *Arizona:* Geographic studies include MALCOLM L. COMEAUX, *Arizona* (1981); and TOM MILLER (ed.), *Arizona: The Land and the People* (1986). History is the subject of THOMAS EDWIN FARISH, *History of Arizona*, 8 vol. (1915–18), still a good source for early history; and THOMAS E. SHERIDAN, *Arizona: A History* (1995); and MARSHALL TRIMBLE, *Arizona: A Cavalcade of History*, rev. ed. (2003). (J.W.B./Ed.)

New Mexico: The state's geography and people are discussed in LANCE CHILTON et al., *New Mexico: A New Guide to the Colorful State* (1984). IRA G. CLARK, *Water in New Mexico* (1987), provides a voluminous study of the state's water problem. ARRELL MORGAN GIBSON, *The Santa Fe and Taos Colonies: Age of the Muses, 1900–1942* (1983), is the best study on the art colonies; while MARTA WEIGLE and KYLE FIORE, *Santa Fe and Taos: The Writer's Era, 1916–1941* (1982), gives an overview of the leading authors of the period. Historical studies of New Mexico include MARC SIMMONS, *New Mexico: An Interpretive History* (1977, reprinted 1988); and THOMAS E. CHAVEZ, *An Illustrated History of New Mexico* (2002). (W.A.B./Ed.)

Oklahoma: JOHN W. MORRIS, CHARLES R. GOINS, and EDWIN C. MCREYNOLDS, *Historical Atlas of Oklahoma*, 3rd rev. ed. (1986), is an excellent source for geography. KENNY A. FRANKS and PAUL F. LAMBERT, *Oklahoma* (1994), details the land and people. Political subjects are analyzed in JAMES R. SCALES and DANNEY GOBLE, *Oklahoma Politics* (1982). A comprehensive historical work is ARRELL MORGAN GIBSON, *Oklahoma*, 2nd ed. (1981). (J.S.E.)

Texas: A good overview is TERRY G. JORDAN, JOHN L. BEAN, JR., and WILLIAM M. HOLMES, *Texas* (1984). Useful reference sources include JOE CUMMINGS, *Texas Handbook*, 4th ed. (1998); and WALTER PRESCOTT WEBB and ELDON STEPHEN BRANDA (eds.), *The Handbook of Texas*, 3 vol. (1952–76), offers encyclopaedic historical information. Excellent studies of the two largest minority groups in the state are ALWYN BARR, *Black Texans: A History of African Americans in Texas, 1528–1995*, 2nd ed. (1996); and ARNOLDO DE LEÓN, *Mexican Americans in Texas*, 2nd ed. (1999). Histories include RUPERT N. RICHARDSON, ADRIAN ANDERSON, and ERNEST WALLACE, *Texas, the Lone Star State*, 7th ed. (1997); and DAVID G. MCCOMB, *Texas, A Modern History* (1989). LIGHT TOWNSEND CUMMINS and ALVIN R. BAILEY, JR. (eds.), *A Guide to the History of Texas* (1988), includes historiographic and topical subject essays. (R.A.Wo./Ed.)

The Mountain region. *Colorado:* MEL GRIFFITHS and LYNNELL RUBRIGHT, *Colorado* (1983), is a systematic look at the state's geography. CORNELIA FLEISCHER MUTEL and JOHN C. EMERICK, *From Grassland to Glacier: The Natural History of Colorado* (1984), describes various Colorado ecosystems. PHILIP L. FRADKIN, *A River No More: The Colorado River and the West* (1981), examines the role of water in the Colorado basin. GLEAVES WHITNEY, *Colorado Front Range: A Landscape Divided* (1983), traces the rapid growth along the Front Range corridor. Historical treatments include CARL ABBOTT, STEPHEN J. LEONARD, and DAVID MCCOMB, *Colorado, a History of the Centennial State*, 3rd ed. (1994); and CARL UBBELOHDE, MAXINE BENSON, and DUAN A. SMITH, *A Colorado History*, 8th ed. (2001). (J.L.Di./Ed.)

Idaho: MERLE WELLS and ARTHUR A. HART, *Idaho* (1985), provides information about the state, its industries, and its history. RANDY STAPILUS, *Paradox Politics: People and Power in Idaho* (1988), analyzes popular government. Histories include F. ROSS PETERSON, *Idaho* (1976); and CARLOS A. SCHWANTES, *In Mountain Shadows: A History of Idaho* (1991, reprinted 1996).
(B.A.M./Ed.)

Montana: Two popular geographies cover the state: JOHN A. ALWIN, *Western Montana* (1983), and *Eastern Montana* (1982). A popular history is HARRY W. FRITZ, *Montana: Land of Contrast* (1984). Histories include JAMES MCLELLAN HAMILTON, *A History of Montana*, ed. by MERRILL G. BURLINGAME, 2nd ed. (1970); and the comprehensive MICHAEL P. MALONE, RICHARD

B. ROEDER, and WILLIAM L. LANG, *Montana, A History of Two Centuries*, rev. ed. (1991). (J.M.C.)

Nevada: A study of the state's settlement is found in WILBUR S. SHEPPERSON, *Restless Strangers: Nevada's Immigrants and Their Interpreters* (1970). RUSSELL R. ELLIOTT, *History of Nevada*, 2nd ed. rev. (1987), is the most detailed and comprehensive reference. JAMES W. HULSE, *The Nevada Adventure: A History*, 5th ed. (1981), provides a general survey from prehistory to modern times. Older but still useful is JAMES G. SCRUGHAM (ed.), *Nevada: A Narrative of the Conquest of a Frontier Land*, 3 vol. (1935). STANLEY W. PAHER, *Nevada: An Annotated Bibliography* (1980), is comprehensive. (R.J.Z.)

Utah: Good references on the land and people are included in THOMAS K. MARTIN, TIM B. HEATON, and STEPHEN J. BAHR (eds.), *Utah in Demographic Perspective: Regional and National Contrasts* (1986). The geologic history is discussed in WILLIAM LEE STOKES, *Geology of Utah* (1986). JOHN W. VAN COTT, *Utah Place Names* (1990), combines geography and local history. Excellent histories include DEAN L. MAY, *Utah* (1987); WAYNE K. HINTON, *Utah: Unusual Beginning to Unique Present* (2000); and RICHARD D. POLL (ed.), *Utah's History* (1978, reprinted 1989).
(L.J.A./Ed.)

Wyoming: WRITERS' PROGRAM OF THE WORK PROJECTS ADMINISTRATION IN THE STATE OF WYOMING, *Wyoming: A Guide to Its History, Highways, and People* (1941, reprinted 1981), provides a still-useful overview of the state. ROBERT HAROLD BROWN, *Wyoming* (1980), describes the land and its resources. DAVID LAGESON and DARWIN SPEARING, *Roadside Geology of Wyoming* (1988); and D.L. BLACKSTONE, JR., *Traveler's Guide to the Geology of Wyoming*, 2nd ed. (1988), trace the state's geologic history. Local stories and geography are included in ANNIE PROULX, *Close Range: Wyoming Stories* (1999). The state's history is traced in T.A. LARSON, *History of Wyoming*, 2nd ed. rev. (1990). (G.R.We.)

The Pacific Coast. *Alaska:* Reference works include *The Alaska Almanac* (annual); and R.K. WOERNER (ed.), *The Alaska Handbook* (1986), an encyclopaedia of information and statistics. Two books from the NATIONAL GEOGRAPHIC SOCIETY (U.S.), *Alaska*, by BERN KEATING, 2nd ed. (1971), and *Alaska: High Roads to Adventure* (1976), offer illustrated essays on geographic regions, people, and industries. An introduction is JAN HALLIDAY and PATRICIA J. PETRIVELLI, *Native Peoples of Alaska: A Traveler's Guide to Land, Art, and Culture* (1998). ALAN EDWARD SCHORR, *Alaska Place Names*, 4th ed. (1991), combines local history and geography. CLARENCE C. HULLEY, *Alaska: Past and Present*, 3rd ed. (1970, reprinted 1981), provides a general history. CLAUDE-M. NASKE and HERMAN E. SLOTNICK, *Alaska*, 2nd ed. (1987), includes chapters on native land claims, conservation, and the oil boom. (M.M.M./Ed.)

California: JAMES D. HART, *A Companion to California*, new ed., rev. and expanded (1987), includes entries on all aspects of the state. Geography and landscape are the subject of GARY L. PETERS and DAVID W. LANTIS, *California*, rev. 2nd ed. (1997); CRANE S. MILLER and RICHARD S. HYSLOP, *California: The Geography of Diversity*, 2nd ed. (2000); and ALLAN A. SHOENHERR, *A Natural History of California* (1992). A series addressing cultural history is KEVIN STARR, *Americans and the California Dream, 1850–1915* (1973, reprinted 1986), *Inventing the Dream: California Through the Progressive Era* (1985), *Material Dreams: Southern California through the 1920's* (1990, reissued 1996), *Endangered Dreams: The Great Depression in California* (1996), *The Dream Endures: California Enters the 1940s* (1997, reissued 2002), and *Embattled Dreams: California in War and Peace, 1940–50* (2002). California's cultural history is also discussed in JAMES M. GREGORY, *American Exodus: The Dust Bowl Migration and Okie Culture in California* (1989). Histories include RICHARD B. RICE, WILLIAM A. BULLOUGH, and RICHARD J. ORSI, *The Elusive Eden: A New History of California*, 3rd ed. (2002); WALTON BEAN and JAMES J. RAWLS, *California*, 5th ed. (1988); and ANDREW ROLLE, *California*, rev. and expanded 6th ed. (2003). (N.Mo./Ed.)

Hawaii: Physical characteristics are examined by JOSEPH R. MORGAN, *Hawai'i, a Unique Geography*, updated ed. (1996); and GORDON A. MACDONALD, AGATIN T. ABBOTT, and FRANK L. PETERSON, *Volcanoes in the Sea: The Geology of Hawaii*, 2nd ed. (1983). Hawaii's natural history is the subject of ALAN C. ZIEGLER, *Hawaiian Natural History, Ecology, and Evolution* (2002). SONIA P. JUVIK, JAMES O. JUVIK, and THOMAS R. PARADISE, *Atlas of Hawai'i*, 3rd ed. (1998), contains information on the state's physical, biotic, cultural, and social environments. ANDREW W. LIND, *An Island Community* (1938, reissued 1968), is an excellent study of the migrations to Hawaii and subsequent race relations; it is complemented by ELVI WHITTAKER, *The Mainland Haole: The White Experience in Hawaii* (1986). Good histories include GAVAN DAWS, *Shoal of Time: A History of the Hawaiian Islands* (1968, reissued 1974), one of the best single-volume histories of Hawaii; and RUTH M. TABRAH, *Hawaii*

(1984). A brief introduction is PHIL BARNES, *A Concise History of the Hawaiian Islands* (1999).   (L.S.M./Ed.)

Oregon: SAMUEL N. DICKEN and EMILY F. DICKEN, *Two Centuries of Oregon Geography,* 2 vol. (1979–82), covers both historical and descriptive geography. EWART M. BALDWIN, *Geology of Oregon,* 3rd ed. (1981), is a handy summary reference. A useful reference source is ELIZABETH L. ORR and WILLIAM N. ORR, *Geology of Oregon,* 5th ed. (1999). LEWIS A. MCARTHUR, *Oregon Geographic Names,* rev. and enlarged 7th ed. (2003), combines geography and local history. Historical treatment is provided by MICHAEL ARRIETA-WALDEN et al. (eds.), *The Oregon Story* (2000); PHIL F. BROGAN, *East of the Cascades,* 4th ed. (1977), a popularization of central Oregon's history; and CHARLES H. CAREY, *General History of Oregon Through Early Statehood,* 3rd ed. (1971).   (R.M.Hi./Ed.)

Washington: The state's varied landforms are covered in DAVID D. ALT and DONALD W. HYNDMAN, *Roadside Geology of Washington* (1998, reissued 2000). A reference work is JAMES W. SCOTT et al., *Historical Atlas of Washington* (1988). DOUG BROKENSHIRE, *Washington State Place Names: From Alki to Yelm* (1993), combines local history and culture. D.W. MEINIG, *The Great Columbia Plain: A Historical Geography, 1805–1910* (1968, reissued 1995), covers the settlement and organization of an area that includes eastern Washington; also useful is JOHN A. ALWIN, *Between the Mountains: A Portrait of Eastern Washington* (1984). Historical works include ROBERT E. FICKEN and CHARLES P. LEWARNE, *Washington: A Centennial History* (1988); and RUTH KIRK and CARMELA ALEXANDER, *Exploring Washington's Past: A Road Guide to History,* updated ed. (2001), organized by region.   (H.J.Cr./Ed.)

United States Presidency and First Lady

The occupant of the office of president of the United States and his wife, known popularly as the "first lady," are two of the most influential and closely watched world figures. They have generated a great deal of scholarly and popular attention and have been both deeply admired and frequently criticized.

The president is the chief executive officer of the United States. In contrast to many countries with parliamentary forms of government, where the office of president, or head of state, is mainly ceremonial, in the United States the president is vested with great authority, and he is arguably the most powerful elected official in the world.

Although the first lady's role has never been codified or officially defined, she figures prominently in the political and social life of the nation. Representative of her husband on official and ceremonial occasions both at home and abroad, the first lady is closely watched for some hint of her husband's thinking and for a clue to his future actions. Although she is unpaid and unelected, her prominence provides her a platform from which to influence behaviour and opinion, and some first ladies have used their influence to affect legislation on important matters such as temperance reform, housing improvement, and women's rights.

This article is divided into the following sections:

Presidency of the United States

DUTIES OF THE OFFICE

The Constitution succinctly defines presidential functions, powers, and responsibilities. The president's chief duty is to make sure that the laws are faithfully executed, and this duty is performed through an elaborate system of executive agencies that includes cabinet-level departments. Presidents appoint all cabinet heads and most other high-ranking officials of the executive branch of the federal government. They also nominate all judges of the federal judiciary, including the members of the Supreme Court. Their appointments to executive and judicial posts must be approved by a majority of the Senate (one of the two chambers of Congress, the legislative branch of the federal government, the other being the House of Representatives). The Senate usually confirms these appointments, though it occasionally rejects a nominee to whom a majority of members have strong objections. The president is also the commander in chief of the country's military and has unlimited authority to direct the movements of land, sea, and air forces. The president has the power to make treaties with foreign governments, though the Senate must

Appointment power (margin note)

South portico of the White House, Washington, D.C.
Tina Hager/White House photo

approve such treaties by a two-thirds majority. Finally, the president has the power to approve or reject (veto) bills passed by Congress, though Congress can override the president's veto by summoning a two-thirds majority in favour of the measure.

HISTORICAL DEVELOPMENT

By the time the Constitutional Convention assembled in Philadelphia on May 25, 1787, wartime and postwar difficulties had convinced most of the delegates that an energetic national executive was necessary. They approached the problem warily, however, and a third of them favoured a proposal that would have allowed Congress to select multiple single-term executives, each of whom would be subject to recall by state governors. The subject consumed more debate at the convention than any other. The stickiest points were the method of election and the length of the executive's term. At first, delegates supported the idea that the executive should be chosen by Congress; however, congressional selection would make the executive dependent on the legislature unless the president was ineligible for reelection, and ineligibility would necessitate a dangerously long term (six or seven years was the most common suggestion).

The delegates debated the method of election until early September 1787, less than two weeks before the convention ended. Finally, the Committee on Unfinished Parts, chaired by David Brearley of New Jersey, put forward a cumbersome proposal—the electoral college—that overcame all objections. The system allowed state legislatures—or the voting public if the legislatures so decided—to choose electors equal in number to the states' representatives and senators combined; the electors would vote for two candidates, one of whom had to be a resident of another state. Whoever received a majority of the votes would be elected president, the runner-up vice president. If no one won a majority, the choice would be made by the House of Representatives, each state delegation casting one vote. The president would serve a four-year term and be eligible for continual reelection (by the Twenty-second Amendment, adopted in 1951, the president was limited to a maximum of two terms).

Committee on Unfinished Parts (margin note)

Until agreement on the electoral college, delegates were unwilling to entrust the executive with significant authority, and most executive powers, including the conduct of foreign relations, were held by the Senate. The delegates hastily shifted powers to the executive, and the result was ambiguous. Article II, Section 1, of the Constitution of the United States begins with a simple declarative statement: "The executive Power shall be vested in a President of the United States of America." The phrasing can be read as a

blanket grant of power, an interpretation that is buttressed when the language is compared with the qualified language of Article I: "All legislative Powers herein granted shall be vested in a Congress of the United States."

This loose construction, however, is mitigated in two important ways. First, Article II itemizes, in Sections 2 and 3, certain presidential powers, including those of commander in chief of the armed forces, appointment making, treaty making, receiving ambassadors, and calling Congress into special session. Had the first article's section been intended as an open-ended authorization, such subsequent specifications would have made no sense. Second, a sizable array of powers traditionally associated with the executive, including the power to declare war, issue letters of marque and reprisal, and coin and borrow money, were given to Congress, not the president, and the power to make appointments and treaties was shared between the president and the Senate.

The delegates could leave the subject ambiguous because of their understanding that George Washington (1789–97) would be selected as the first president. They deliberately left blanks in Article II, trusting that Washington would fill in the details in a satisfactory manner. Indeed, it is safe to assert that, had Washington not been available, the office might never have been created.

President George Washington (centre) and first lady Martha Washington (on the dais) hosting a reception.

Postrevolutionary period. Scarcely had Washington been inaugurated when an extraconstitutional attribute of the presidency became apparent. Inherently, the presidency is dual in character. The president serves as both head of government (the nation's chief administrator) and head of state (the symbolic embodiment of the nation). Through centuries of constitutional struggle between the crown and Parliament, England had separated the two offices, vesting the prime minister with the function of running the government and leaving the ceremonial responsibilities of leadership to the monarch. The American people idolized Washington, and he played his part artfully, striking a balance between "too free an intercourse and too much familiarity," which would reduce the dignity of the office, and "an ostentatious show" of aloofness, which would be improper in a republic.

But the problems posed by the dual nature of the office remained unsolved. A few presidents, notably Thomas Jefferson (1801–09) and Franklin D. Roosevelt (1933–45), proved able to perform both roles. More common were the examples of John F. Kennedy (1961–63) and Lyndon B. Johnson (1963–69). Although Kennedy was superb as the symbol of a vigorous nation—Americans were entranced by the image of his presidency as Camelot—he was ineffectual in getting legislation enacted. Johnson, by contrast, pushed through Congress a legislative program of major proportions, including the Civil Rights Act of 1964, but he was such a failure as a king surrogate that he chose not to run for a second term.

Washington's administration was most important for the precedents it set. For example, he retired after two terms, establishing a tradition maintained until 1940. During his first term he made the presidency a full-fledged branch of government instead of a mere office. As commander in chief during the American Revolutionary War, he had been accustomed to surrounding himself with trusted aides and generals and soliciting their opinions. Gathering the department heads together seemed a logical extension of that practice, but the Constitution authorized him only to "require the Opinion, in writing" of the department heads; taking the document literally would have precluded converting them into an advisory council. When the Supreme Court refused Washington's request for an advisory opinion on the matter of a neutrality proclamation in response to the French revolutionary and Napoleonic wars—on the ground that the court could decide only cases and not controversies—he turned at last to assembling his department heads. Cabinet meetings, as they came to be called, remained the principal instrument for conducting executive business until the late 20th century, though some early presidents, such as Andrew Jackson (1829–37), made little use of the cabinet.

The Constitution also authorized the president to make treaties "by and with the Advice and Consent of the Senate," and many thought that this clause would turn the Senate into an executive council. But when Washington appeared on the floor of the Senate to seek advice about pending negotiations with American Indian tribes, the surprised senators proved themselves to be a contentious deliberative assembly, not an advisory board. Washington was furious, and thereafter neither he nor his successors took the "advice" portion of the clause seriously. At about the same time, it was established by an act of Congress that, though the president had to seek the approval of the Senate for his major appointments, he could remove his appointees unilaterally. This power remained a subject of controversy and was central to the impeachment of Andrew Johnson (1865–69) in 1868.

Washington set other important precedents, especially in foreign policy. In his *Farewell Address* (1796) he cautioned his successors to "steer clear of permanent alliances with any portion of the foreign world" and not to "entangle our peace and prosperity in the toils of European ambition, rivalship, interest, humor, or caprice." His warnings laid the foundation for America's isolationist foreign policy, which lasted through most of the country's history before World War II, as well as for the Monroe Doctrine.

Perils accompanying the French revolutionary wars occupied Washington's attention, as well as that of his three immediate successors. Americans were bitterly divided over the wars, some favouring Britain and its allies and others France. Political factions had already arisen over the financial policies of Washington's secretary of the treasury, Alexander Hamilton, and from 1793 onward animosities stemming from the French Revolution hardened these factions into a system of political parties, which the framers of the Constitution had not contemplated.

The emergence of the party system also created unanticipated problems with the method for electing the president. In 1796 John Adams (1797–1801), the candidate of the Federalist Party, won the presidency and Thomas Jefferson (1801–09), the candidate of the Democratic-Republican Party, won the vice presidency; rather than working with Adams, however, Jefferson sought to undermine the administration. In 1800, to forestall the possibility of yet another divided executive, the Federalists and the Democratic-Republicans, the two leading parties of the early republic, each nominated presidential and vice presidential candidates. Because of party-line voting and the fact that electors could not indicate a presidential or vice presidential preference between the two candidates for whom they voted, the Democratic-Republican candidates, Jefferson and Aaron Burr, received an equal number of votes. The election was thrown to the House of Representatives, and a constitutional crisis nearly ensued as the House became deadlocked. Had it remained deadlocked until the end of Adams's term on March 4, 1801, Supreme Court Chief Justice John Marshall would have become president in keeping with the existing presidential succession act. On February 17, 1801, Jefferson was finally chosen president by the House, and with the ratification of the Twelfth

Margin notes:

Dual character of the office

Washington's *Farewell Address*

Twelfth
Amend-
ment

Amendment, beginning in 1804, electors were required to cast separate ballots for president and vice president.

The **presidency in the 19th century.**   Jefferson shaped the presidency almost as much as did Washington. He altered the style of the office, departing from Washington's austere dignity so far as to receive foreign ministers in run-down slippers and frayed jackets. He shunned display, protocol, and pomp; he gave no public balls or celebrations on his birthday. By completing the transition to republicanism, he humanized the presidency and made it a symbol not of the nation but of the people. He talked persuasively about the virtue of limiting government—his first inaugural address was a masterpiece on the subject—and he made gestures in that direction. He slashed the army and navy, reduced the public debt, and ended what he regarded as the "monarchical" practice of addressing Congress in person. But he also stretched the powers of the presidency in a variety of ways. While maintaining a posture of deference toward Congress, he managed legislation more effectively than any other president of the 19th century. He approved the Louisiana Purchase despite his private conviction that it was unconstitutional. He conducted a lengthy and successful war against the Barbary pirates of North Africa without seeking a formal declaration of war from Congress. He used the army against the interests of the American people in his efforts to enforce an embargo that was intended to compel Britain and France to respect America's rights as neutral during the Napoleonic wars and ultimately to bring those two countries to the peace table. In 1810 Jefferson wrote in a letter that circumstances "sometimes occur" when "officers of high trust" must "assume authorities beyond the law" in keeping with the "*salus populi*..., the laws of necessity, of self-preservation, of saving our country when in danger." On those occasions "a scrupulous adherence to written law, would be to lose the law itself...thus absurdly sacrificing the end to the means."

Jefferson
and the
*salus
populi*

From Jefferson's departure until the end of the century, the presidency was perceived as an essentially passive institution. Only three presidents during that long span acted with great energy, and each elicited a vehement congressional reaction. Andrew Jackson exercised the veto flamboyantly; attempted, in the so-called Bank War, to undermine the Bank of the United States by removing federal deposits; and sought to mobilize the army against South Carolina when that state adopted an Ordinance of Nullification declaring the federal tariffs of 1828 and 1832 to be null and void within its boundaries. By the time his term ended, the Senate had censured him and refused to receive his messages. (When Democrats regained control of the Senate from the Whigs, Jackson's censure was expunged.) James K. Polk (1845–49) maneuvered the United States into the Mexican War and only later sought a formal congressional declaration. When he asserted that "a state of war exists" with Mexico, Senator John C. Calhoun of South Carolina launched a tirade against him, insisting that a state of war could not exist unless Congress declared one. The third strong president during the period, Abraham Lincoln (1861–65), defending the *salus populi* in Jeffersonian fashion, ran roughshod over the Constitution during the American Civil War. Radical Republican congressmen were, at the time of his assassination, sharpening their knives in opposition to his plans for reconstructing the rebellious Southern states, and they wielded them to devastating effect against his successor, Andrew Johnson. They reduced the presidency to a cipher, demonstrating that Congress can be more powerful than the president if it acts with complete unity. Johnson was impeached on several grounds, including his violation of the Tenure of Office Act, which forbade the president from removing civil officers without the consent of the Senate. Although Johnson was not convicted, he and the presidency were weakened.

Contributing to the weakness of the presidency after 1824 was the use of national conventions rather than congressional caucuses to nominate presidential candidates (see below *The convention system*). The new system existed primarily as a means of winning national elections and dividing the spoils of victory, and the principal function of the president became the distribution of government jobs.

Changes in the 20th century.   In the 20th century the

Portraits of President Abraham Lincoln by Mathew Brady in 1860 and 1864. The images show the tremendous physical toll that the office can take on presidents.
Mathew Brady—Bettmann/Corbis

powers and responsibilities of the presidency were transformed. President Theodore Roosevelt (1901–09) regarded the presidency as a "bully pulpit" from which to preach morality and rally his fellow citizens against "malefactors of great wealth," and he wheedled from Congress a generous fund for railroad travel to put his pulpit on wheels. Other presidents followed Roosevelt's example, with varying results. Woodrow Wilson (1913–21) led the United States into World War I to make the world "safe for democracy," though he failed to win congressional approval for American membership in the League of Nations. Franklin D. Roosevelt was the first president to use the medium of radio effectively, and he raised the country's morale dramatically during the Great Depression. Ronald Reagan (1981–89), known as the "Great Communicator," employed televised addresses and other appearances to restore the nation's self-confidence and commit it to struggling against the Soviet Union, which he referred to as an "evil empire."

"Bully
pulpit"

Corbis

President Ronald Reagan challenging the Soviet Union to tear down the Berlin Wall at the Brandenburg Gate in West Berlin in 1987.

Theodore Roosevelt also introduced the practice of issuing substantive executive orders. Although the Supreme Court ruled that such orders had the force of law only if they were justified by the Constitution or authorized by Congress, in practice they covered a wide range of regulatory activity. By the early 21st century some 50,000 executive orders had been issued. Roosevelt also used executive agreements—direct personal pacts with other chief executives—as an alternative to treaties. The Supreme Court's ruling in *U.S.* v. *Belmont* (1937) that such agreements had the constitutional force of a treaty greatly enhanced the president's power in the conduct of foreign relations.

Executive
orders and
agreements

Woodrow Wilson introduced the notion of the president as legislator in chief. Although he thought of himself as a Jeffersonian advocate of limited government, he considered the British parliamentary system to be superior to the American system, and he abandoned Jefferson's precedent

by addressing Congress in person, drafting and introducing legislation, and employing pressure to bring about its enactment.

Franklin D. Roosevelt completed the transformation of the presidency. In the midst of the Great Depression, Congress granted him unprecedented powers, and, when it declined to give him the powers he wanted, he simply assumed them; after 1937 the Supreme Court acquiesced to the changes. Equally important was the fact that the popular perception of the presidency had changed; people looked to the president for solutions to all their problems, even in areas quite beyond the capacity of government at any level. Everything good that happened was attributed to the president's benign will, everything bad to wicked advisers or opponents. Presidential power remained at unprecedented levels from the 1950s to the mid-1970s, when Richard Nixon (1969–74) was forced to resign the office because of his role in the Watergate Scandal. The Watergate affair greatly increased public cynicism about politics and elected officials, and it inspired legislative attempts to curb executive power in the 1970s and '80s.

Several developments since the end of World War II have tended to make the president's job more difficult. After Roosevelt died and Republicans gained a majority in Congress, the Twenty-second Amendment, which limits presidents to two terms of office, was adopted in 1951. Two decades later, reacting to perceived abuses by Presidents Lyndon Johnson and Richard Nixon, Congress passed the Budget and Impoundment Control Act to reassert its control over the budget; the act imposed constraints on impoundments, created the Congressional Budget Office, and established a timetable for passing budget bills. In 1973, in the midst of the Vietnam War, Congress overrode Nixon's *War* veto of the War Powers Act, which attempted to reassert *Powers* Congress's constitutional war-making authority by subject-*Act* ing future military ventures to congressional review. Subsequent presidents, however, contended that the resolution was unconstitutional and generally ignored it. Confrontations over the constitutional limits of presidential authority became more frequent in the 1980s and '90s, when the presidency and Congress were commonly controlled by different parties, which led to stalemate and a virtual paralysis of government.

One challenge facing presidents beginning in the late 20th century was the lack of reliable sources of information. Franklin D. Roosevelt could depend on local party bosses for accurate grassroots data, but the presidents of later generations had no such resource. Every person or group seeking the president's attention had special interests to plead, and misinformation and disinformation were rife. Moreover, the burgeoning of the executive bureaucracy created filters that limited or distorted the information flowing to the president and his staff. Public opinion polls, on which presidents increasingly depended, were often biased and misleading. Another problem, which resulted from the proliferation of presidential primaries after 1968 and the extensive use of political advertising on television, was the high cost of presidential campaigns and the consequent increase in the influence of special interest groups (see below *The money game*).

At the start of the 21st century, presidential power, while nominally still enormous, was institutionally bogged down *Post-* by congressional reforms and the changing relationship *Cold War* between the presidency and other institutional and non-*presidency* institutional actors. Moreover, the end of the Cold War shattered the long-standing bipartisan consensus on foreign policy and revived tensions between the executive and legislative branches over the extent of executive war-making power. The presidency also had become vulnerable again as a result of scandals and impeachment during the second term of Bill Clinton (1993–2001), and it seemed likely to be weakened even further by the bitter controversy surrounding the 2000 presidential election, in which Republican George W. Bush lost the popular vote but narrowly defeated the Democratic candidate, Vice President Al Gore, in the electoral college after the U.S. Supreme Court ordered a halt to the manual recounting of disputed ballots in Florida. It is conceivable, however, that this trend was welcomed by the public. For as opinion polls

consistently showed, though Americans liked strong, activist presidents, they also distrusted and feared them.

(F.McD.)

SELECTING A PRESIDENT

Although the framers of the Constitution established a system for electing the president—the electoral college—they did not devise a method for nominating presidential candidates or even for choosing electors. They assumed that the selection process as a whole would be nonpartisan and devoid of factions (or political parties), which they believed were always a corrupting influence in politics. The original process worked well in the early years of the republic, when Washington, who was not affiliated closely with any faction, was the unanimous choice of electors in both 1789 and 1792. However, the rapid development of political parties soon presented a major challenge, one that led to changes that would make presidential elections more partisan but ultimately more democratic.

The practical and constitutional inadequacies of the original electoral college system became evident in the election of 1800, when the two Democratic-Republican candidates, Jefferson and Burr, received an equal number of electoral votes and thereby left the presidential election to be decid-

Bettmann/Corbis

Theodore Roosevelt election campaign buttons, 1904.

ed by the House of Representatives. The Twelfth Amendment (1804), which required electors to vote for president and vice president separately, remedied this constitutional defect.

Because each state was free to devise its own system of choosing electors, disparate methods initially emerged. In some states electors were appointed by the legislature, in others they were popularly elected, and in still others a mixed approach was used. In the first presidential election, in 1789, four states (Delaware, Maryland, Pennsylvania, and Virginia) used systems based on popular election. Popular election gradually replaced legislative appointment, the most common method through the 1790s, until by the 1830s all states except South Carolina chose electors by direct popular vote.

The evolution of the nomination process. *"King Caucus."* While popular voting was transforming the electoral college system, there were also dramatic shifts in the method for nominating presidential candidates. There being no consensus on a successor to Washington upon his retirement after two terms as president, the newly formed political parties quickly asserted control over the process. Beginning in 1796, caucuses of the parties' congressional delegations met informally to nominate their presidential and vice presidential candidates, leaving the general public with no direct input. The subsequent demise in the 1810s of the Federalist Party, which failed even to nominate a presidential candidate in 1820, made nomination by the Democratic-Republican caucus tantamount to election as president. This early nomination system—dubbed "King Caucus" by its critics—evoked widespread resentment, even from some members of the Democratic-Republican caucus. By 1824 it had fallen into such disrepute that only one-fourth of the Democratic-Republican congressional delegation took part in the caucus that nominated Secretary of the Treasury William Crawford instead of more popular figures such as John Quincy Adams and Andrew Jackson. Jackson, Adams, and Henry Clay eventually joined Crawford in contesting the subsequent presidential election, in which Jackson received the most popular and electoral votes but was denied the presidency by the House of Representatives (which selected Adams) after he failed to win the required majority in the electoral college. Jackson, who was particularly enraged following Adams's appointment of Clay as secretary of state, called unsuccessfully for the abolition of the electoral college, but he would get his revenge by defeating Adams in the presidential election of 1828.

The convention system. In a saloon in Baltimore, Maryland, in 1832, Jackson's Democratic Party held one of the country's first national conventions (the first such convention had been held the previous year—in the same saloon—by the Anti-Masonic Party). The Democrats nominated Jackson as their presidential candidate and Martin Van Buren as his running mate and drafted a party platform. It was assumed that open and public conventions would be more democratic, but they soon came under the control of small groups of state and local party leaders, who handpicked many of the delegates. The conventions were often tense affairs, and sometimes multiple ballots were needed to overcome party divisions—particularly at conventions of the Democratic Party, which required its presidential and vice presidential nominees to secure the support of two-thirds of the delegates (a rule that was abolished in 1936).

The convention system was unaltered until the beginning of the 20th century, when general disaffection with elitism led to the growth of the Progressive movement and the introduction in some states of binding presidential primary elections, which gave rank-and-file party members more control over the delegate-selection process. By 1916 some 20 states were using primaries, though in subsequent decades several states abolished them. From 1932 to 1968 the number of states holding presidential primaries was fairly constant (between 12 and 19), and presidential nominations remained the province of convention delegates and party bosses rather than of voters. Indeed, in 1952 Democratic convention delegates selected Adlai Stevenson as the party's nominee though Estes Kefauver had won more

than three-fifths of the votes in that year's presidential primaries. In 1968, at a raucous convention in Chicago that was marred by violence on the city's streets and chaos in the convention hall, Vice President Hubert Humphrey captured the Democratic Party's presidential nomination despite his not having contested a single primary.

Bettmann/Corbis

U.S. President Harry S. Truman accepting the Democratic Party nomination for the presidency on July 15, 1948, in Philadelphia.

Post-1968 reforms. To unify the Democratic Party, Humphrey appointed a committee that proposed reforms that later fundamentally altered the nomination process for both major national parties. The reforms introduced a largely primary-based system that reduced the importance of the national party conventions. Although the presidential and vice presidential candidates of both the Democratic Party and the Republican Party are still formally selected by national conventions, most of the delegates are selected through primaries—or, in a minority of states, through caucuses—and the delegates gather merely to ratify the choice of the voters.

The modern nomination process. *Deciding to run.* Although there are few constitutional requirements for the office of the presidency—presidents must be natural-born citizens, at least 35 years of age, and residents of the United States for at least 14 years—there are considerable informal barriers. No woman or ethnic minority has yet been elected president, and almost all presidents have been Protestants. Successful presidential candidates generally have followed one of two paths to the White House: from prior elected office (some four-fifths of presidents have been members of the U.S. Congress or state governors) or from distinguished service in the military (*e.g.*, Washington, Jackson, and Dwight D. Eisenhower [1953–61]).

The decision to become a candidate for president is often a difficult one, in part because candidates and their families must endure intensive scrutiny of their entire public and private lives by the news media. Before officially entering the race, prospective candidates usually organize an exploratory committee to assess their political viability. They also travel the country extensively to raise money and to generate grassroots support and favourable media exposure. Those who ultimately opt to run have been described by scholars as risk takers who have a great deal of confidence in their ability to inspire the public and to handle the rigours of the office they seek.

The money game. Political campaigns in the United States are expensive—and none more so than those for the presidency. Presidential candidates generally need to raise tens of millions of dollars to compete for their party's nomination. Even candidates facing no internal party opposition, such as incumbent presidents Bill Clinton in 1996 and George W. Bush in 2004, raise enormous sums to dissuade prospective candidates from entering the race and to campaign against their likely opponent in the general election before either party has officially nominated a candidate. Long before the first vote is cast, candidates spend much of their time fund-raising, a fact that has prompted many political analysts to claim that in reality the so-called "money primary" is the first contest in the presidential nomination process. Indeed, much of the early media coverage of a presidential campaign focuses on fund-raising, particularly at the end of each quarter, when the candi-

Election of 1824

dates are required to file financial reports with the Federal Election Commission (FEC). Candidates who are unable to raise sufficient funds often drop out before the balloting has begun.

In the 1970s legislation regulating campaign contributions and expenditures was enacted to address increasing concerns that the largely private funding of presidential elections enabled large contributors to gain unfair influence over a president's policies and legislative agenda. Presidential candidates who agree to limit their expenditures in the primaries and caucuses to a fixed overall amount are eligible for federal matching funds, which are collected through a taxpayer "check-off" system that allows individuals to contribute a portion of their federal income tax to the Presidential Election Campaign Fund. To become eligible for such funds, candidates are required to raise a minimum of $5,000 in at least 20 states (only the first $250 of each contribution counts toward the $5,000); they then receive from the FEC a sum equivalent to the first $250 of each individual contribution (or a fraction thereof if there is a shortfall in the fund). Candidates opting to forgo federal matching funds for the primaries and caucuses, such as George W. Bush in 2000 and 2004, John Kerry in 2004, and self-financed candidate Steve Forbes in 1996, are not subject to spending limits. From 1976 through 2000, candidates could collect from individuals a maximum contribution of $1,000, a sum subsequently raised to $2,000 and indexed for inflation by the Bipartisan Campaign Reform Act of 2002.

<div style="margin-left:2em">Presidential Election Campaign Fund</div>

Despite these reforms, money continues to exert a considerable influence in the nomination process and in presidential elections. Although prolific fund-raising by itself is not sufficient for winning the Democratic or Republican nominations or for being elected president, it is certainly necessary.

The primary and caucus season.   Most delegates to the national conventions of the Democratic and Republican parties are selected through primaries or caucuses and are pledged to support a particular candidate. Each state party determines the date of its primary or caucus. Historically, Iowa held its caucus in mid-February, followed a week later by a primary in New Hampshire; the campaign season then ran through early June, when primaries were held in states such as New Jersey and California. Winning in either Iowa or New Hampshire—or at least doing better than expected there—often boosted a campaign, while faring poorly sometimes led candidates to withdraw. Accordingly, candidates often spent years organizing grassroots support in these states. In 1976 such a strategy in Iowa propelled Jimmy Carter (1977–81), then a relatively unknown governor from Georgia, to the Democratic nomination and the presidency.

Because of criticism that Iowa and New Hampshire were unrepresentative of the country and exerted too much influence in the nomination process, several other states began to schedule their primaries earlier. In 1988, for example, 16 largely Southern states moved their primaries to a day in early March that became known as "Super Tuesday." Such "front-loading" of primaries and caucuses continued during the 1990s, prompting Iowa and New Hampshire to schedule their contests even earlier, in January, and causing the Democratic Party to adopt rules to protect the privileged status of the two states. By 2004 some 35 states had scheduled their primaries or caucuses for February or early March; few primaries or caucuses are now held in May or June. Front-loading has severely truncated the campaign season, requiring candidates to raise more money sooner and making it more difficult for lesser-known candidates to gain momentum by doing well in early primaries and caucuses.

<div style="margin-left:2em">"Front-loading"</div>

Presidential nominating conventions.   One important consequence of the front-loading of primaries is that the nominees of both major parties are now usually determined by March or April. To secure a party's nomination, a candidate must win the votes of a majority of the delegates attending the convention. (More than 4,000 delegates attend the Democratic convention, while the Republican convention usually comprises some 2,500 delegates.) In most Republican primaries the candidate who wins the

statewide popular vote is awarded all the state's delegates. By contrast, the Democratic Party requires that delegates be allocated proportionally to each candidate who wins at least 15 percent of the popular vote. It thus takes Democratic candidates longer than Republican candidates to amass the required majority. In 1984 the Democratic Party created a category of "superdelegates," who are unpledged to any candidate. Consisting of federal officeholders, governors, and other high-ranking party officials, they usually constitute 15 to 20 percent of the total number of delegates. Other Democratic delegates are required on the first ballot to vote for the candidate whom they are pledged to support, unless that candidate has withdrawn from consideration. If no candidate receives a first-ballot majority, the convention becomes open to bargaining, and all delegates are free to support any candidate. The last convention to require a second ballot was held in 1952, before the advent of the primary system.

The Democratic and Republican nominating conventions are held during the summer prior to the November general election and are publicly funded through the taxpayer check-off system. (The party that holds the presidency usually holds its convention second.) Shortly before the convention, the presidential candidate selects a vice presidential running mate, often to balance the ticket ideologically or geographically or to shore up one or more of the candidate's perceived weaknesses.

<div style="margin-left:2em">Selection of running mate</div>

In the early days of television, the conventions were media spectacles and were covered by the major commercial networks gavel to gavel. As the importance of the conventions declined, however, so, too, did the media coverage of them. Nevertheless, the conventions are still considered vital. It is at the conventions that the parties draft their platforms, which set out the policies of each party and its presidential candidate. The convention also serves to unify each party after what may have been a bitter primary season. Finally, the conventions mark the formal start of the general election campaign (because the nominees do not receive federal money until they have been formally chosen by the convention delegates), and they provide the candidates with a large national audience and an opportunity to explain their agendas to the American public.

The general election campaign.   Although the traditional starting date of the general election campaign is Labor Day (the first Monday in September), in practice the campaign begins much earlier, because the nominees are known long before the national conventions. Like primary campaigns and the national conventions, the general election campaign is publicly funded through the taxpayer check-off system. When public financing was introduced in the 1970s, it became standard for the Democratic and Republican candidates to opt to receive federal matching funds for the general election; in exchange for such funds, they agree to limit their spending to an amount equal to the federal matching funds they receive plus a maximum personal contribution of $50,000. In 2004, for example, each major party nominee received some $75 million.

Minor party presidential candidates face formidable barriers. Whereas Democratic and Republican presidential candidates automatically are listed first and second on general election ballots, minor party candidates must navigate the complex and varied state laws to gain ballot access. In addition, a new party is eligible for federal financing in an election only if it received at least 5 percent of the vote in the previous election. All parties that receive at least 25 percent of the vote in the prior presidential election are entitled to equivalent public funding.

A candidate's general election strategy is largely dictated by the electoral college system. All states except Maine and Nebraska follow the unit rule, by which all of a state's electoral votes are awarded to the candidate who receives the most popular votes in that state. Candidates therefore focus their resources and time on large states and states that are considered toss-ups, and they tend to ignore states that are considered safe for one party or the other and states with few electoral votes.

<div style="margin-left:2em">Unit rule</div>

Modern presidential campaigns are media-driven, as candidates spend millions of dollars on television advertising and on staged public events (photo ops) designed to gener-

ate favourable media coverage. The most widely viewed campaign spectacles are the debates between the Democratic and Republican presidential and vice presidential candidates (minor parties are often excluded from such debates, a fact cited by critics who contend that the current electoral process is undemocratic and inimical to viewpoints other than those of the two major parties). First televised in 1960, such debates have been a staple of the

Bettmann/Corbis

Democratic presidential candidate John F. Kennedy debating Republican candidate Richard M. Nixon in 1960. The series of presidential debates were the first in U.S. history to be televised.

presidential campaign since 1976. They are closely analyzed in the media and sometimes result in a shift of public opinion in favour of the candidate who is perceived to be the winner or who is seen as more attractive or personable by most viewers. (Some analysts have argued, for example, that John F. Kennedy's relaxed and self-confident manner, as well as his good looks, aided him in his debate with Richard Nixon and contributed to his narrow victory in the presidential election of 1960.) Because of the potential impact and the enormous audience of the debates—some 80 million people watched the single debate between Jimmy Carter and Ronald Reagan in 1980—the campaigns usually undertake intensive negotiations over the number of debates as well as their rules and format.

The presidential election is held on the Tuesday following the first Monday in November. Voters do not actually vote for presidential and vice presidential candidates but rather vote for electors pledged to a particular candidate. Only on rare occasions, such as the disputed presidential election in 2000 between Al Gore and George W. Bush, is it not clear on election day (or the following morning) who won the presidency. Although it is possible for the candidate who has received the most popular votes to lose the electoral vote (as also occurred in 2000), such inversions are infrequent. The electors gather in their respective state capitals to cast their votes on the Monday following the second Wednesday in December, and the results are formally ratified by Congress in early January.

Upon winning the election, a nonincumbent president-elect appoints a transition team to effect a smooth transfer of power between the incoming and outgoing administrations. The formal swearing-in ceremony and inauguration of the new president occurs on January 20 in Washington, D.C. The chief justice of the United States administers the formal oath of office to the president-elect: "I do solemnly swear (or affirm) that I will faithfully execute the office of President of the United States, and will to the best of my ability, preserve, protect and defend the Constitution of the United States." The new president's first speech, called the Inaugural Address, is then delivered to the nation. (Ed.)

First lady

THE EARLY YEARS

Because the framers of the Constitution left the chief executive considerable latitude in choosing advisers, he was able to seek counsel from a wide variety of friends and

family, including his wife. The first president made decisions that highlighted the consort's role. When Martha Washington (first lady from 1789 to 1797) joined President George Washington in New York City a month after his April 1789 inauguration, she arrived on a conspicuous barge and was greeted as a public hero. The president had already arranged to combine his office and residence in one building, thus providing her with ample opportunity to receive her callers and participate in official functions. Although she refrained from taking a stand on important issues, she was carefully watched and widely hailed as "Lady Washington."

Abigail Adams (1797–1801), the wife of John Adams, enlarged what had been primarily a social role. She took an active part in the debate over the development of political parties, and she sometimes pointed out to her husband people she considered his enemies. Although she did not disdain the household management role that her predecessor had played (she oversaw the initial move to the new White House in Washington, D.C., in November 1800), critics focused on the political counsel she gave her husband, and some referred to her sarcastically as "Mrs. President."

Because Thomas Jefferson (1801–09) was a widower during his presidency, he often turned to the wife of Secretary of State James Madison to serve as hostess. Thus Dolley Madison had ample time (two Jefferson administrations and her husband's two terms, 1809–17) to leave a strong mark. With the assistance of architect Benjamin Latrobe, she decorated the president's residence elegantly and entertained frequently. Her egalitarian mix of guests increased her popularity. During the British assault on the White House in August 1814, near the end of the War of 1812, she provided for the rescue of some of the residence's first acquisitions, which endeared her to many Americans and solidified the role of the president's wife as overseer of the nation's most famous home.

Elizabeth Monroe (1817–25), the wife of James Monroe, appealed to elitists who insisted that the presidential family should illustrate "the very best" of American society, but she had few supporters among those who were more egalitarian. Although she helped her husband select furnishings for the presidential mansion, newly rebuilt after the British assault in 1814 (this furniture became prized possessions of later tenants), she entertained much less than Dolley Madison, and Washingtonians reacted by boycotting some of her parties. Louisa Adams (1825–29), the wife of John Quincy Adams, struggled with the same problem her predecessor had faced: how to deal with the tension already evident in American culture concerning whether the president's family should mix freely and live simply or reside in luxury and be revered from afar.

1829 TO 1901

The presidential candidacy of Andrew Jackson illustrated how important the role of the president's wife could be. Rachel Jackson did not live to see her husband inaugurated, but earlier she had been attacked by the press, with one newspaper questioning whether she was qualified to serve "at the head of the female society of the United States."

By 1829 the outline for the job of president's wife was clear: hostess and social leader, keeper of the presidential residence, and role model for American women. When the president respected his wife's opinion (as John Adams did), she could also function as political counsel and strategist.

Between 1829 and 1900 many presidents' wives—such as Margaret Taylor (1849–50), who was chronically ill, and Jane Pierce (1853–57), whose son had been killed in a train accident—sought to avoid public attention by withdrawing behind invalidism and personal grief. Their husbands, as well as other presidents who were widowers or bachelors, often turned over hostess duties to young female relatives (daughters, daughters-in-law, or nieces), whose youth gained them admirers and excused their lapses in etiquette or lack of sophistication. Among the handful of 19th-century presidential wives who did seek a public role, Sarah Polk (1845–49), the wife of James Polk, was well versed in the political issues of the day and was considered a major influence on her husband. Mary Todd Lincoln (1861–65),

the wife of Abraham Lincoln, though insecure in a visible role, prevailed on her husband to grant favours to friends and hangers-on. Julia Grant (1869–77), the wife of Ulysses S. Grant, was an extravagant and popular hostess during the Gilded Age and was the first of the presidents' wives to write an autobiography, though it was not published until 1975.

Before the Civil War the president's wife had remained a local figure, little known outside the capital, but in the last third of the 19th century she began to receive national attention. Magazines carried articles about her and the presidential family. With the completion of the transcontinental railroad in 1869, travel across the country became easier, and Lucy Hayes (1877–81), the wife of Rutherford B. Hayes, became the first president's wife to travel from coast to coast. This exposure, plus her association with the popular temperance movement and her own simplicity in matters of dress and decoration, contributed to her immense popularity. After journalists hailed her as "first lady of the land," the title entered common usage. Following the production of a popular play, *First Lady*, in 1911, the title became still more popular, and in 1934 it entered Merriam-Webster's *New International Dictionary*.

Popularization of the term "first lady"

1901 TO 1953

In the 20th century—as the United States began to play a greater role in world affairs, as the president assumed increasing importance both at home and abroad, and as women's educational and job opportunities improved— the role of first lady grew considerably. Edith Roosevelt (1901–09), the wife of Theodore Roosevelt, extended the role in two ways: first, by hiring a secretary who publicized her activities and, second, by overseeing major architectural renovations of the Executive Mansion, which was officially renamed the White House by her husband.

Helen Taft (1909–13), the wife of William Howard Taft, was intensely political and ambitious for her husband, but she suffered a paralyzing stroke in May 1909 and for a year could not undertake public duties. Her major contribution as first lady was the planting of ornamental cherry trees in the capital. In 1914 her autobiography, *Recollections of Full Years*, became the first such book published by a president's wife during her lifetime.

Ellen Wilson (1913–14), the first wife of Woodrow Wilson, lived in the White House only 17 months before dying of kidney disease, but she advanced the cause of housing reform by bringing together specialists and legislators at the White House and by conducting tours of slum areas. When Congress passed a housing bill at the time of her death, she became the first president's wife to have her name so prominently attached to legislation. Edith Wilson (1915–21), Woodrow Wilson's second wife, was an attentive companion to her hardworking husband but was decidedly less devoted to reform. At the end of World War I in 1918, she accompanied him to the peace talks at Versailles, France, becoming the first president's wife to travel internationally amid such publicity. After the president

Corbis

President Woodrow Wilson and first lady Edith Wilson. Her assistance to her husband after his stroke prompted complaints that she was running the government herself.

suffered a stroke in October 1919, she served as a vigilant gatekeeper, monitoring all his visitors and messages. Critics complained of "petticoat government," though she later characterized her actions as simply watching over her husband's convalescence while making no major decisions herself. Historians remain divided over the exact nature of her role during this period.

"Petticoat government"

Florence Harding (1921–23), the wife of Warren G. Harding, illustrated the extent to which Americans had come to accept that women—including first ladies—played an important role in public life. She had assisted in running her husband's newspaper in Marion, Ohio, and assumed a prominent social role when he went to Washington, D.C., as a U.S. senator in 1915. As first lady, she paid close attention to press coverage and kept the White House open to a wide variety of visitors.

Although some of her predecessors had gone to college, Grace Coolidge (1923–29), the wife of Calvin Coolidge, was the first president's wife to have earned a university degree. Her enormous personal popularity offset her husband's reputation for laconic dourness. Often photographed in glamorous gowns or with some of her menagerie of animals, she also made news by attempting (unsuccessfully) to refurbish the family quarters of the White House with furniture from the colonial period.

Lou Hoover (1929–33), the wife of Herbert Hoover, held the same Stanford University degree as her husband, and the two had collaborated on the translation of an important mining textbook, but she distanced herself from the substantive decisions he made as president. Although she confined herself to domestic management and to leading widely approved causes such as the Girl Scouts and physical education for women, she set one precedent when she became the first president's wife to give speeches on national radio. Her effort to catalog White House holdings and to furnish one of the upstairs rooms as the Monroe Drawing Room foreshadowed later restoration efforts of her successors.

Bettmann/Corbis

First lady Eleanor Roosevelt in front of the White House with Chiang Mei-ling, wife of Chinese leader Chiang Kai-shek.

Eleanor Roosevelt (1933–45), the wife of Franklin D. Roosevelt, entered the White House with grave reservations about undertaking the job of first lady, but, before she left, she set new standards for how her successors would be judged. First lady for longer than any other woman, she extended the limits on what unelected, unappointed public figures could do. Her husband's paralysis as a result of poliomyelitis suffered in 1921 led her to travel for him, and she often said that she acted as his "eyes and ears." She was also motivated by her early exposure to reform movements and her feeling of responsibility toward others, gained from a family that had long been involved in liberal causes and that prominently featured its women as well as its men. In the 1920s her association with a network of politically powerful women helped to augment her zeal. Inspired by all these factors, she was an extremely ac-

Eleanor Roosevelt

tive first lady, writing articles, giving speeches, and taking stands on controversial issues. Moreover, she was widely viewed as appealing to constituencies different from her husband's, including women, African Americans, youth, the poor, and others who had formerly felt shut out of the political process. Although she regularly disclaimed any influence, she was credited with gaining appointments to important posts for many individuals from these groups. Throughout her tenure she held regular press conferences, limiting attendance to women until the start of World War II, thus ensuring that news agencies would hire more women correspondents. Her continued participation in public affairs after her husband's death further underlined the prestige she held in her own right. As a U.S. representative to the United Nations, she helped to shape the Universal Declaration of Human Rights and secure its unanimous passage. She continued to be active in the Democratic Party in the 1950s, and in 1961 President John F. Kennedy named her chair of his Commission on the Status of Women, a post she held until her death in 1962.

The fact that Bess Truman (1945–53), the wife of Harry S. Truman, could achieve enormous popularity as first lady and yet act so differently from Eleanor Roosevelt showed how malleable the role of first lady had become. Intensely private, she refused to hold press conferences and revealed little when she answered written questions from reporters. As a result, the extent of her influence on her husband is difficult to assess. After leaving office, President Truman said that he had talked over his most important decisions with his wife because "her judgment was always good," but their daughter, Margaret, suggested that Bess Truman was not so closely involved.

1953 TO 1977

Mamie Eisenhower (1953–61), the wife of Dwight D. Eisenhower, did not significantly change the role of first lady. Popular with many Americans for her down-to-earth style, she saw her first name attached to a hairstyle ("Mamie bangs") and a chocolate fudge recipe. Her press conferences were limited to social matters, and, when she published an article before the 1952 election, she refused to take sides, telling readers to vote for her husband or for Adlai Stevenson but to "please vote."

Jacqueline Kennedy Onassis (1961–63) was, as the wife of John F. Kennedy, the youngest first lady in 75 years. She gained enormous popularity at home and abroad because of her youth, her glamour and style, and her two photogenic young children. The first president's wife to name her own press secretary, she struggled to guard her privacy. Her White House renovation, which was aimed at restoring the mansion to its original elegance, gained wide approval. In 1961 she established the White House Historical Association, which later facilitated the mansion's official designation as a museum (1988).

Lady Bird Johnson (1963–69) had been a member of Washington society for nearly three decades while her husband, Lyndon B. Johnson, served in the House of Representatives and the Senate. An efficient household administrator, she had also taken an active part in her husband's political campaigns, and during World War II she had briefly run his Washington office. By the presidential election of 1960, she was such a seasoned campaigner that Robert Kennedy credited her with carrying Texas for the Democrats. In 1964, when her husband's popularity in some parts of the country was low because of his support for civil rights, she undertook a whistle-stop campaign through the South. After he won the presidential election that year, she spearheaded a program that encouraged Americans to do more to improve the appearance of their neighbourhoods and that resulted in the Highway Beautification Act of 1965.

Pat Nixon (1969–74), the wife of Richard M. Nixon, also had a long Washington apprenticeship, but she received little credit for her accomplishments in the White House. A dutiful consort, she traveled thousands of miles, giving speeches and greeting potential voters. She opened the White House to groups that had not been invited before—including the blind, who were permitted to touch the furnishings—and she staged special holiday functions for senior citizens. Her program to encourage volunteerism never really caught on, however, and her reluctance to discuss her role or highlight her achievements diminished her place in history. Nevertheless, she continued to be named one of the most-admired American women long after she returned to private life.

Betty Ford (1974–77), the wife of Gerald R. Ford, often said that because she entered the White House in the wake of the Watergate affair, which forced Nixon's resignation, she felt an enormous responsibility to be candid. During a press conference within a month of becoming first lady, she openly expressed opinions that differed from her husband's on several important issues, including abortion. A few weeks later, after undergoing a mastectomy for breast cancer, she insisted on telling the truth instead of concealing the matter, as some of her predecessors had done during their own serious illnesses. Following her example, many women went for medical examinations, a fact that, as she later wrote, made her realize the power of the first lady. Some of the interviews she gave, including one in which she discussed her teenage daughter's sex life, led to criticism, but, on balance, Americans approved of her openness. After she left the White House, her confessions of alcoholism and drug dependence won additional approval.

1977 TO PRESENT

Rosalynn Carter (1977–81), the wife of Jimmy Carter, broke new ground for first ladies in several ways. Eighteen months before the 1976 election, she began campaigning for her husband on her own. In 1977, soon after becoming first lady, she traveled to seven Latin American countries, where she met with political leaders and discussed substantive matters such as trade and defense. This marked a departure from the kind of "fact-finding" trips that Eleanor Roosevelt had undertaken, and, after encountering criticism, she confined future trips to ceremonial or goodwill missions. Nevertheless, she attended cabinet meetings when the subject of discussion interested her—the first president's wife to do so. She also made headlines by testifying in support of the Mental Health Systems Act before a committee of the U.S. Senate. After leaving the White House, she wrote *First Lady from Plains* (1984), an insightful look at her husband's administration.

Nancy Reagan (1981–89), the wife of Ronald Reagan, insisted that she had little influence on her husband's decisions, but, before she left the White House, the *New York Times* wrote that she had "expanded the job of First Lady into a sort of Associate Presidency." She was often credited with influencing personnel decisions (both in hiring and firing), setting her husband's travel schedule, and shaping his agenda. She was criticized for what many considered "elitist" social behaviour and excessive spending, though private donors footed the bills. Her early association with a foster-grandparents program brought little favourable attention. However, her self-deprecating performance at a private dinner for journalists in 1982 and her leadership in an antidrug campaign, "Just Say No," increased her popularity.

Barbara Bush (1989–93), the wife of George Bush, followed tradition in refusing to specify how her own opinions differed from her husband's, and she was enormously popular for her personal style. White-haired and full-figured, she laughingly reported that there were "a lot of fat, white-haired wrinkled ladies…tickled pink" to see someone like themselves in the White House. Her association with a campaign to increase literacy also won her admirers, and all the revenue earned from her best-selling book about her dog Millie was donated to the Barbara Bush Foundation for Family Literacy.

Hillary Rodham Clinton (1993–2001), the wife of Bill Clinton, entered the White House with a law degree, a successful career of her own, and connections to a large network of successful professionals, including other lawyers and activists. When she took an office in the West Wing of the White House (the first president's wife to do so) and was named by the president to head a task force on health care reform, many expected that she would carve out a substantive policy role for herself. Although the delibera-

tions of the task force did not result in important legislation, they did highlight the first lady's power. After a group of physicians complained that she was not a "government official" and thus had no right to keep the task force meetings closed, a federal appeals court ruled in her favour, citing a long tradition of presidents' wives acting "as advisers and personal representatives of their husbands." Her appearance before five Congressional committees to discuss

American first lady Hillary Clinton (left) with her Salvadoran counterpart Elizabeth de Calderon Sol, at the First Ladies' Forum on Domestic Violence in San Salvador, El Salvador, in 1998.

the recommendations of the task force focused attention on the leading role she had taken in health care reform. Her public pronouncements on foreign policy and her changing stance on several other issues were frequently criticized, and they sometimes even conflicted with positions taken by her husband's administration. But her social activism, her frequent trips abroad without the president, the interviews she gave before, during, and after her husband's impeachment, and her successful candidacy for a U.S. Senate seat from New York state in 2000 all highlighted the independent power that a first lady could attain.

Election of Hillary Clinton

Laura Welch Bush, the wife of George W. Bush, indicated that, as first lady (from 2001), she would be less of an activist than her predecessor but more of a public figure than her traditional mother-in-law. She publicly disagreed with her husband's position on *Roe* v. *Wade* (1973), the U.S. Supreme Court decision that guaranteed the legality of abortion (she supported the ruling, he opposed it); she also invited writers to the White House who had openly criticized her husband, and she agreed to testify before a Senate committee on education. In a more traditional vein, she organized a national book fair to promote literacy and to encourage Americans to use libraries, organized

a foundation for American libraries, and devoted considerable time to comforting Americans after the September 11 attacks of 2001.

Since 1789 the role of first lady has changed considerably. Although still dependent on individual personalities, it has come to include involvement in political campaigns, management of the White House, championship of social causes, and representation of the president at official and ceremonial occasions. Because first ladies now typically publish their memoirs, which are viewed as potential sources of additional information about their husbands' administrations, and because the public is interested in these increasingly independent women in their own right, first ladies frequently remain a focus of attention long after their husbands' terms of office have ended. (2003), treats first ladies from Martha Washington to Laura Bush and discusses how their roles reflected changes in the status of women. LEWIS L. GOULD (ed.), *American First Ladies: Their Lives and Their Legacy*, 2nd ed. (2001), includes articles on first ladies written by experts.   (B.B.C.)

Uruguay

U ruguay (officially the República Oriental del Uruguay) is located on the southeastern coast of South America. It is bounded by Brazil to the north and east, by the Atlantic Ocean to the southeast, and by the Río de la Plata to the south, while the Uruguay River serves as its western boundary with Argentina. Although Uruguay may seem small in comparison with Brazil or Argentina, it has an area of 68,037 square miles (176,215 square kilometres)—more than twice the size of Scotland and nearly as extensive as the U.S. state of Missouri. Almost half of the population is concentrated in the metropolitan area of Montevideo, the capital. The popula-

tions of the largest provincial cities are just fractions of that of the capital.

Uruguay developed throughout much of the 20th century as one of Latin America's more progressive societies, notable for its political stability, advanced social legislation, and a relatively large middle class. However, the country has struggled with some of the economic and social problems common to the region, including a period of military rule (1973–85) that has cast a long shadow over national life. Since colonial times Uruguay has also been profoundly influenced by relations with its larger neighbours.

This article is divided into the following sections:

Physical and human geography

THE LAND

Relief, soils, and drainage. The Uruguayan landscape is largely characterized by gently rolling land, with an average elevation of about 383 feet (117 metres). Tidal lakes and sand dunes fringe the coastline. Elsewhere there are broad valleys, plains (*pampas*), low plateaus and hills, and ridges—notably Cuchilla de Haedo in the north and Cuchilla Grande in the southeast—that are a southward extension of the Brazilian Highlands. Mount Catedral, which rises to 1,685 feet (514 metres) near the southeastern coast, is the highest point in the nation. The valleys and coastal plains are covered with deposits of sand, clay, and fertile alluvium.

Although it is a well-watered nation, no large rivers flow entirely within Uruguay. The Uruguay River and the estuary of the Río de la Plata, along the western border of the nation, are navigable for oceangoing ships until Paysandú and for smaller vessels above that point to the falls at Salto.

Negro River

The smaller Negro River, which traverses the country from northeast to southwest, is navigable only in its lower part, below Rincón del Bonete Lake (the Río Negro Reservoir). Among other small rivers are the Santa Lucía, Cebollatí, and Queguay Grande. Lake Merín (Mirim), which lies mainly within Brazil, is the largest natural lake.

Climate. Uruguay has a generally pleasant, temperate climate. The average temperature for the midwinter month of July varies from 54° F (12° C) at Salto in the northern interior to 50° F (10° C) at Montevideo in the south. The midsummer month of January varies from a warm average of 79° F (26° C) at Salto to 72° F (22° C) at Montevideo. Frost is almost unknown along the coast. Both summer and winter weather may vary from day to day with the passing of storm fronts; a hot northerly wind may occasionally be followed by a cold wind (*pampero*) from the Argentine Pampas.

Uruguay has neither a decidedly dry nor a rainy season. The heaviest rainfall occurs during March and April, autumn months in the Southern Hemisphere, although more frequent rains occur in winter. The mean annual pre-

cipitation is generally greater than 40 inches (1,000 millimetres), decreasing with distance from the seacoast, and is relatively evenly distributed throughout the year. Thunderstorms occur frequently during the summer.

Plant and animal life. Tall-grass prairies once covered most of Uruguay's land surface but now compete with enclosed, planted pastures. Only a small percentage of the land is forested, most of the trees growing in narrow stretches along watercourses. The principal species are ombu (a scrubby, treelike plant) and alder. Others include willow, eucalyptus, pine, poplar, acacia, and aloe. The algaroba (carob tree) and quebracho (whose wood and bark are utilized in tanning and dyeing) are prevalent, and indigenous palms grow in the valleys and along the southeastern coast. Common smaller plants include mimosa, myrtle, rosemary, and scarlet-flowered ceibo.

Animals native to Uruguay have largely disappeared, although pumas and jaguars are still occasionally found in remote areas. Other native mammals include foxes, deer, wildcats, armadillos (*mulitas*), and several types of rodent, including huge capybaras. Scorpions are rare, but venomous spiders are common. Among the birdlife are tiny burrowing owls, crows, lapwings, partridges, quails, hummingbirds, and cardinals. Parakeets are plentiful in the hills, and the lagoons swarm with waterfowl, including white herons, cranes, and flamingos. Rheas are now mainly limited to semidomesticated settings. Lizards, tortoises, and venomous snakes are found in many areas. Caimans inhabit the upper waters of the Uruguay River, and seals are found on small islands off the southeastern coast, particularly on Lobos Island.

Settlement patterns. When Uruguay became independent in 1828, its national territory was used almost exclusively for grazing herds of cattle and sheep on unfenced ranges; there were few permanent settlements outside of Montevideo, Colonia del Sacramento, and the villages along the Uruguay River. The grazing lands along the eastern shore of the river constituted a kind of no-man's-land between the Portuguese Brazilians and the Spanish Argentines.

After independence, Uruguay received a small influx of

immigrants, chiefly from Italy and Spain. They entered through Montevideo and settled southern Uruguay in a zone along the Río de la Plata and Uruguay River. But from the early 1850s the European immigrants to the Plata region went largely to Argentina, and agriculture in Uruguay remained static. Livestock grazing thrived in the sparsely populated north, but crop farming was largely limited to the south. By the early 20th century, rail lines and roadways had extended throughout much of the country, and the area devoted to farming had grown markedly, notably with the introduction of sheep herds and pastures enclosed with barbed wire. Sheep now far outnumber cattle in the northwest, but cattle are of major importance south of the Negro River. However, ranches (*estancias*), some larger than 25,000 acres (10,000 hectares), are still common in the pastoral region.

Montevideo, on the coast, developed as the country's one large urban centre, with a virtual monopoly on commerce, manufacturing, and government services. Other, much smaller cities include Salto and Paysandú, both on the Uruguay River, Artigas and Rivera, in the north, Melo in the east, and the southern cities of Maldonado, Minas, and Las Piedras.   (P.E.J./M.H.A./M.We.)

THE PEOPLE

Uruguayans are of predominantly European origin, mostly descendants of 19th- and 20th-century immigrants from Spain and Italy and, to a much lesser degree, France and Britain. Earlier settlers had migrated from Argentina and Paraguay. Few direct descendants of Uruguay's indigenous peoples remain, and mestizos (of mixed European and Indian ancestry) account for less than one-tenth of the population. Blacks and mulattos make up an even smaller proportion of the total.

More than three-fourths of the people of Uruguay are at least nominally Roman Catholic, but as many as two-fifths of the Catholics are estimated to be nonreligious. Less than one-tenth of the population adheres to Protestant, Mormon, and other Christian churches. Jews, mostly in Montevideo, make up a small minority group, which is nevertheless one of the larger Jewish communities in South America.

Spanish is spoken throughout Uruguay, although in Rivera and other borderland towns close to Brazil an admixture of Portuguese and Spanish can be heard, often in a slang called Portuñol, from the words *português* and *español*.

Almost nine-tenths of Uruguayans live in urban areas. The rates of birth and population growth are much lower than in other Latin American countries, and about one-fourth of the population is less than 15 years old.

THE ECONOMY

Uruguay's gross national product (GNP) per capita is among the highest in Latin America, and the nation has a large urban middle class. Its relatively high standard of living has historically been based on earnings from agricultural exports, notably wool and beef, which have never-

theless been subject to fluctuations in the world market. To reduce the nation's dependence on external trade, successive governments have encouraged domestic manufacturing and services, which have become dynamic sectors of the economy. The government operates a large number of corporations that produce electricity, refine imported petroleum, manufacture alcohol and cement, and process meat and fish; the government also controls the railways and the nation's largest telephone company. However, there have been attempts to privatize state-owned companies since the 1990s.

Uruguay imports most of its fuel, industrial raw materials, vehicles, and industrial machinery because it has no domestic commercial sources of petroleum, natural gas, coal, or iron. The low, rolling countryside is not generally suited to hydroelectric development; however, hydroelectric plants on the Negro and Uruguay rivers began producing at full power by the early 1980s and now provide about one-seventh of the country's electric power. The remainder is generated from gas- and oil-fired thermal plants.

Agriculture, fishing, and forestry. Sheep and cattle raising are two of Uruguay's most important economic activities. Wool and beef, as well as livestock, livestock products, and skins and hides, account for about two-fifths of Uruguay's export income, although agriculture makes up less than one-tenth of the gross domestic product (GDP). With the major emphasis on livestock, little arable land has been available for cultivation. Major crops include rice, wheat, corn (maize), oranges, sugarcane, and sunflower seeds. The grape harvest sustains a modest wine industry.

Uruguay's commercial fishing expanded significantly in the 1970s and '80s, although the fleet remains small by international standards. About half of the catch is exported. Major fishing ports include Montevideo, Piriápolis, Punta del Este, and La Paloma. Forestry in Uruguay is limited but provides for most local needs; pine and eucalyptus are the main types of trees harvested.

Manufacturing. About one-sixth of the GDP is generated by manufacturing, which employs one-fifth of the workforce. Major manufactures include processed foods, beverages, chemical products, textiles, and tobacco products. Most factories are concentrated in and around Montevideo.

Services. Finance, trade, public administration, education, and other services account for more than three-fifths of the GDP and employ a comparable percentage of the workforce. The financial sector alone generates about one-fourth of the GDP. The Central Bank of Uruguay (1967) issues currency (the Uruguayan peso), regulates foreign exchange, and oversees the country's private banks. Other state banks include the Bank of the Eastern Republic of Uruguay, which is the country's largest commercial bank, and the Mortgage Bank of Uruguay. Tourism is a growing source of foreign exchange. Resort areas, particularly on the coast, attract visitors throughout most of the year. Among these is Punta del Este, renowned as a meeting place for high-level international conferences. Uruguay's balance of payments has been generally negative since the mid-20th century. The main exports are live animals and animal products (notably frozen beef), food products, wool and other textiles, and hides. The chief imports include machinery, appliances, chemical products, transport equipment, and processed foods. Brazil has long been Uruguay's main trading partner; Argentina and the United States are also major partners.

Trade

Transportation. Paved roads connect Montevideo to other urban centres in the country, the main highways leading to the border and neighbouring cities. Numerous unpaved roads connect farms and small towns. Overland trade has increased markedly since the Mercosur pact was formed in the 1990s. Most of the country's domestic freight and passenger service is by road rather than rail. The basic railroad network, purchased from the British after World War II, also radiates from Montevideo and connects with the Argentine and Brazilian systems.

Oceangoing ships call mainly at Montevideo. Vessels of various sizes navigate the inland waters, and a hydrofoil service connects Buenos Aires and Montevideo across the Río de la Plata. An international airport lies near the Carrasco beach resort some 13 miles (21 kilometres) from downtown Montevideo. The government-owned airline (Primeras Líneas Uruguayas de Navegación Aérea) links Montevideo with the provincial capitals and international destinations.

ADMINISTRATION AND SOCIAL CONDITIONS

Government. The government operates under the 1966 constitution as amended following the period of military

brought the country so low, but the war had made too deep an impact on ordinary Uruguayans, who had become polarized into Colorados or Blancos. In 1865 the Colorados, aided by a Brazilian army, ousted the Blancos from power; however, the Paraguayan dictator, seeing that action as a threat to the regional balance of power, sparked the War of the Triple Alliance (1864–70), in which Brazil, Uruguay, and Argentina combined to defeat Paraguay. Uruguayan commerce was disrupted by the war, as well as by persistent political disputes, a civil war known as the Revolution of the Lances (1868–72), and Brazilian and Argentine involvement in Uruguayan affairs.

MODERNIZATION AND REFORM

Development accelerated during the latter part of the 19th century as increasing numbers of immigrants established businesses and bought land. Partly through their efforts, sheep were introduced to graze together with cattle, ranches were fenced, and pedigreed bulls and rams were imported to improve livestock breeding. Earnings from wool (which became the leading export in 1884), hides, and dried beef encouraged British investment in railroad building and also helped to modernize Montevideo—notably in its public utilities and transportation system—which thereby encouraged additional immigration. In 1876 the Uruguayan armed forces took over the government and, aided by improved communications, began to establish firmer control over the interior. However, public support for the regime eventually waned because of brutality and corruption in some of its leaders, and a civilian Colorado government returned to power in 1890.

Blanco demands for a larger role in government escalated into the Revolution of 1897, led by Aparicio Saravia, which ended when the Colorado president, Juan Idiarte Borda, was killed by an assassin not associated with the Blancos. Although conflicts between Colorados and Blancos continued to impede economic development, Uruguay's population grew to one million by 1900—a 13-fold increase over the level of 1830. The Colorado leader José Batlle y Ordóñez was elected president in 1903. The following year the Blancos led a rural revolt, and eight bloody months of fighting ensued before Saravia was killed in battle and government forces emerged victorious. In 1905 the Colorados won the first largely transparent legislative election in 30 years, and domestic stability was finally attained.

Batlle, who had become a Colorado hero, took advantage of the nation's stability and increasing economic prosperity to institute major reforms, including expanding state intervention in economic matters. His administration helped expand cattle ranching, reduce the nation's dependence on imports and foreign capital, improve workers' conditions, and expand education. In addition Batlle abolished the death penalty, allowed women to initiate divorce proceedings, augmented the rights of children born out of wedlock, and reduced the political influence of the Roman Catholic church—reflecting growing trends toward social liberalization and secularization in Uruguay.

Batlle had two terms (1903–07 and 1911–15) in which to initiate his policies, but, realizing that his program might be reversed by a future president or dictator, he promoted a constitutional reform to end the presidency and replace it with a plural executive, the *colegiado*. Batlle's audacious plan split the Colorados and reinvigorated the Blanco opposition, and the *colegiado* was defeated in a 1916 election in which the secret ballot was used for the first time. Batlle retained a significant amount of prestige and support, however, which allowed him to strike a compromise that partly rescued the *colegiado;* thus, in the constitution of 1919 executive responsibility was split between the president and a National Council of Administration.

A consensus government emerged with policies that were more cautious than innovative, except in social legislation. Higher living standards were supported by a ranching economy that had stopped growing, a dilemma hidden by the high export prices of the late 1920s.

ECONOMIC AND POLITICAL UNCERTAINTIES

In 1930 the Colorado Gabriel Terra successfully maneuvered his presidential candidacy through the political vacuum created by the death in 1929 of Batlle, who had held an increasingly complex political and governmental structure together. When the effects of the Great Depression hit Uruguay, President Terra first blamed the plural executive's economic policies and then, supported by Blanco leader Luis Alberto de Herrera, carried out a coup on March 31, 1933, that abolished the National Council and concentrated power in the hands of the president. Terra's dictatorship, followed by the presidency of his brother-in-law General Alfredo Baldomir during the period 1938–42, formulated a conservative response to the Great Depression. The state interfered with labour unions, postponed social legislation, preserved as much as it could of the British market for Uruguayan meat, and halted attempts to nationalize foreign, mainly British, enterprises in Uruguay. The government advocated free-market principles but was compelled to play a more direct role in the economy. It apportioned scarce foreign exchange, built a hydroelectric dam, and hired public employees under a system of political quotas. Hard times also sped migration from the interior to Montevideo, where industrial development was encouraged. As a result of these factors, Uruguay emerged from the Great Depression with a more urban population and a larger government bureaucracy.

At the onset of World War II, European nations began eagerly to buy Uruguay's meat, wool, and hides, bringing a period of genuine prosperity. A new constitution in 1942 allowed all political parties to operate freely. The war also strengthened Uruguay's manufacturing sector, which employed nearly 100,000 people by 1945. Increasing numbers of urban workers joined labour unions, and corporatist "salary councils" arranged for higher wages. The presidential election of 1946 was won by Tomás Berreta, a Batllista (member of the Colorado Batllista Party, founded by Batlle in 1919). After his sudden death, Vice President Luis Batlle Berres, Batlle's nephew, became president.

During the early 1950s the Korean War stimulated high wool prices on the U.S. market, creating another economic boom for Uruguay. The resulting prosperity enabled the government of Batlle Berres to purchase the British-owned railroads and public utilities, inaugurate new state enterprises, encourage industrialization, subsidize agriculture, and reduce food prices. Unemployment virtually disappeared. A constitutional reform in 1951 replaced the presidency with a nine-member plural executive, the traditional cornerstone of the Batllista program. During this period Uruguay combined a strong democracy with the highest income per capita in Latin America. However, in the mid-1950s, when the end of the Korean War lowered wool prices, Uruguay's ranching economy declined, as did the standard of living. Politicians, responding to voters' demands, tried to keep consumption up, first by spending Uruguay's foreign exchange, then by taking out foreign loans and devaluing the peso. Economic conditions deteriorated: annual inflation rates rose above 60 percent, public services broke down, and industries closed.

Voter dissatisfaction brought the Blancos to power in 1958 for the first time since 1865. Although reelected for a second term, the Blanco administration failed to improve conditions, and in 1966 a new constitution was ratified, returning the country to the presidential system. Elections in that year brought new leadership under Colorado conservatives, but inflation and a production slump continued to grip the country, precipitating increasingly greater protests followed by a government crackdown on students and unions. During that period guerrilla attacks were initiated in Montevideo by the Tupamaros, a leftist group named for Tupac Amaru II, an 18th-century Inca who had rebelled against Spanish rule. When the police could not stop the Tupamaros, the government unleashed the military to defeat them in a systematic and brutal counterinsurgency campaign. Economic problems persisted, however, and in 1973 the military wrested control of the government from the nation's discredited politicians.

THE MILITARY REGIME

The military acted with a ferocity and thoroughness previously unknown to Uruguay. Thousands of people were arrested—reputedly giving the nation the highest ratio of

José Batlle y Ordóñez

The Korean War

political prisoners to population in the world—and numerous human rights abuses were perpetrated, including torture, killings, and disappearances. The junta also outlawed political parties, dissolved unions, and heavily censored the media in order to strengthen its hold on power and force a new economic outlook on the citizenry. The regime held wages down, forbade strikes, attracted foreign banks and lenders by setting high interest rates, and encouraged industrialists and ranchers to borrow and modernize. Though real wages fell and many businesses failed because they could not compete with cheap imports, the policy had some successes, including an increase in manufactured exports and Montevideo's reemergence as a financial centre; in addition, the government built roads and other public works. In 1980 voters rejected the military's proposed new constitution in a plebiscite—much to the military leaders' surprise, because they controlled the media and severely restricted the political opposition. The plebiscite greatly damaged the regime's legitimacy.

Economic conditions also deteriorated. In the 1980s foreign loans became more difficult to acquire, and Uruguayan trade was limited when Argentina's economy suffered a downturn, caused partly by the Falkland Islands War (1982). The military government was compelled to let the exchange rate of the Uruguayan peso fall. Businesses, ranchers, and the government saw their debts dramatically increase. With Uruguay's economic crisis worsening, the military reluctantly negotiated a return to democratic rule.

CIVILIAN GOVERNMENT

Julio María Sanguinetti, a Colorado Batllista, was elected president in November 1984 and inaugurated the following March. Sanguinetti attempted to appease the military—and to safeguard against a coup—by sponsoring a general amnesty (1986), despite calls for criminal trials. Uruguay's enormous foreign debt inhibited economic recovery, but Sanguinetti refused to embark on dramatic economic programs that would have entailed high risks. A referendum in April 1989 upheld the amnesty law, but the Colorado Party lost the subsequent presidential election to the Blanco candidate, Luis Alberto Lacalle.

The Lacalle administration (1990–95) carried out economic reforms and made Uruguay a member of the Southern Common Market (Mercosur) in 1991. Although economic growth accelerated under Lacalle, his policies were seen as a threat to Uruguay's long-standing welfare system, and voters in a referendum rejected his plan to privatize the state-owned telephone company. This defeat, coupled with charges of government corruption, brought about a roughly three-way split in the 1994 elections between the Colorados, the leftist coalition Broad Front (Frente Amplio) and the Blancos. Sanguinetti was elected to a second nonconsecutive term (1995–2000), and a constitutional amendment in 1996 simplified the method for electing the president (the old "double simultaneous voting" system, which had effectively combined primaries and final elections, had unfairly favoured the traditional parties). The Colorados retained the presidency in 2000 following the election of Jorge Batlle Ibáñez, son of Batlle Berres and great nephew of José Batlle y Ordóñez. Meanwhile, the Broad Front held onto the mayoralty of Montevideo, which it had controlled for a decade.

The Broad Front

Uruguay's economy grew markedly during the mid-1990s, largely because of trade with its Mercosur partners; however, the nation became even more vulnerable to economic shifts in Brazil and Argentina. In the early 21st century there was growing pressure to investigate disappearances, murders, and other crimes committed under military rule.   (M.I.V./M.We.)

Venezuela

Venezuela (Republic of Venezuela; Spanish: República de Venezuela), located at the northern extremity of the South American continent, occupies a roughly triangular area of 352,144 square miles (912,050 square kilometres), which is about one and a half times the size of France. It is bounded by the Caribbean Sea and the Atlantic Ocean to the north, Guyana to the east, Brazil to the south, and Colombia to the southwest and west. The national capital, Caracas, is the primary centre of industry, commerce, education, and tourism. Reflecting the nation's rapid urbanization, the Caracas metropolitan area population increased sixfold between 1950 and 1980. Venezuela has jurisdiction over a number of Caribbean islands, among which are Margarita Island, the largest, Los Roques, Tortuga, and La Blanquilla. There is a long-standing dispute with Guyana, dating to 1840, over territorial jurisdiction of that country's area west of the Essequibo River, of which Venezuela claims some 53,000 square miles. A dispute with another neighbour, Colombia, over the precise demarcation of maritime boundaries has also endured at length.

A physically diverse country, Venezuela has landscapes that are a complex product of the interaction of culture and nature. The republic's development pattern has been unique among Latin-American countries in terms of the speed, sequence, and timing of economic and demographic growth. The 20th century witnessed the transformation of a relatively poor agrarian society to a rapidly urbanizing one, a condition brought about by the wealth and prosperity derived from the exploitation of the country's huge petroleum reserves. These changes, however, have been accompanied by problems of economic imbalance and regional inequalities, with often acute political debate over the meaning and direction of local and national development. The government must deal with a massive and largely uncontrolled rural-to-urban migration, as well as mass immigration, much of it illegal, from Colombia and other neighbours. Once primarily a food exporter, Venezuela has become heavily dependent upon imported food and commodities to satisfy the domestic material demands and life-styles of its urban population. Years of petrodollar abundance were accompanied by undisciplined borrowing from overseas financial institutions, leaving the country with a growing debt-repayment problem, a condition that was intensified by the oil depression of the late 1970s and '80s. Venezuela has also not been exempt from the type of governmental patronage and corruption commonly regarded as traditional in Latin-American countries. On the other hand the republic can point to a notable degree of political stability and basic democracy since the late 1950s.

This article is divided into the following sections:

Physical and human geography

Venezuelan geography presents a number of discernible contrasts of landscape, people, and culture. Towering mountains, tropical jungles, broad river plains, and arid coastal plains provide a diversity of natural habitats that present challenging opportunities for regional development and territorial integration. Sprawling metropolitan centres, densely populated mountain valleys, aboriginal log houses along riverbanks, and open, sparsely settled Llanos (plains) present a diversity of settlement patterns. Pre-Hispanic, colonial Hispanic, and modern social elements coexist in a rich variety of cultural identities. A stable network of towns and cities, whose interconnections define the directions of resource distribution, reflect social continuity within the nation.

THE LAND

Relief. Altitude and relief are the important discriminators of Venezuela's physical landscape, with seasonal climatic variation providing environmental diversity within broader physiographic domains. Three broad regional divisions can be delimited: the Cordillera, a mountain region (reaching heights of about 16,400 feet [5,000 metres] above sea level), the lowland plains (reaching to 1,600 feet), and the interior forested uplands (reaching to 8,200 feet). Within these three broad divisions, seven physiographic regions can be distinguished: the Andes Mountains; the Lake Maracaibo Lowlands; the islands and coastal plains (including the Orinoco delta); the coastal mountain system; the valleys and hill ranges of northwestern Venezuela, also called the Segovia Highlands; the Llanos; and the Guiana Highlands.

The Andes Mountains, including the highest peaks in Venezuela, extend northward into Venezuela in two branches, between which lie the Lake Maracaibo Lowlands. The western branch, the Sierra de Perijá, extending along the border with Colombia, is an extension of the Colombian Andes' Cordillera Oriental. The eastern branch, the Cordillera de Mérida, extends from the Tachira depression, which separates it from the Cordillera Oriental, to the Barquisimeto depression. Physiographically, the Segovia Highlands, northwest of Barquisimeto, and the coastal ranges, which in this treatment are regarded separately, may also be considered a part of the Andes chain. The highest point of the Venezuelan Andes is Pico Bolívar (16,427 feet) in the Mérida Mountains; a considerable part of the mountain region has temperate

Physiographic regions

(*templado*) conditions, but the cold (*frio*) zone is much smaller than in other Andean countries.

The high Andean ranges overlook the lowlands of Lake Maracaibo, much of which are filled by the lake itself— actually a large shallow inlet, or embayment, of the sea. The main oil-producing region of the country, it is covered by dense tropical rain forest in the south, but closer to the Caribbean there is xerophytic thorn scrubland.

Islands and coastal plains
The islands and coastal plains are located to the north and northeast of Venezuela. They include the Caribbean "Islands to the Leeward," such as Margarita and Tortuga, and several peninsulas, including the head-shaped Paraguaná to the west and, to the east, Araya and Paria, the latter a finger of land pointing at Trinidad. The coastal plains extend from the Colombian border and the Gulf of Venezuela eastward to the foothills of the Coastal Range; the Unare Basin, the country's largest inland embayment, spreads out east of the range. Beyond Unare, in the east, the Orinoco delta opens onto the Atlantic Ocean through a number of distributaries (*canos*); an early gateway to the interior, it is a low, dank, and swampy area heavily dissected by streams.

The coastal mountain system, in effect two parallel ranges—the Coastal Range and the Interior Range—contains Venezuela's greatest concentration of population, although covering only 3 percent of the national territory. In the intermontane valleys are the major cities of Caracas, Valencia, and Maracay, and all but the steepest slopes are populated. The highest point is Naiguatá peak (9,069 feet).

The valleys and hill ranges of the northwest form a transitional upland zone between the Coastal and Andean mountains. Elevations there range from 1,600 to 5,500 feet. The only desert in Venezuela—the city of Coro's sand dunes—is found in this region.

Between the Mérida Range and the Orinoco River lie the Llanos, a relatively level savanna region, where the only undulations of relief are between low mesalike interfluves and shallow, meandering, braided river courses. Cattle grazing predominates in this sparsely populated region, which experiences river flooding in summer and drought in winter as seasonal extremes. From the Andean foothills to the Orinoco delta, these Llanos extend for some 800 miles, varying in width from 100 miles in the east to 300 miles in the west.

The Guiana Highlands
From the Orinoco through the southernmost (Amazonas) territory bordering Colombia, Brazil, and Guyana is the Guiana Highlands, or Guayana, largely an upland surface of rounded hills and narrow valleys formed from ancient crystalline rocks. Occupying almost 50 percent of the country, it is the most remote and least explored area of Venezuela. Along the southern border with Brazil are groups of massive plateaus and mesas, known as *tepuis,* capped with resistant sandstone, which are remnants of the former erosional surfaces of the original continental landmass. These *tepuis* are covered with intermingled savanna and semideciduous forest, and like the lowland savannas of the Llanos, they experience extreme rainy and dry seasons. In the southeastern Guiana Highlands, in the region called La Gran Sabana (a high plain), are the Angel Falls, the highest waterfall in the world (3,212 feet). The highlands are sparsely settled. An estimated 30,000 native Indians live in the tropical forests of the Amazonas territory bordering Brazil and Colombia. Other settlements are clustered around mission stations along the rivers. The highlands, however, have tremendous resource potential; they abound in deposits of iron ore, gold, and diamonds, and they possess considerable hydroelectric potential, as well as hardwood forest resources. The long-standing conflict with Guyana over territorial jurisdiction of bordering areas, as well as the tensions over Brazilian and Colombian settlements and illegal crossings of people, cattle, and contraband on the Amazonas borders, have made the highlands a region of increasing strategic importance.

Drainage and soils. The Venezuelan drainage network consists almost entirely of two watersheds, the largest emptying into the Atlantic Ocean via the Orinoco River system and the other, into the Caribbean Sea.

The Orinoco River basin
The Orinoco River and its main tributary, the Caroní, drain a 366,000-square-mile basin; some 80 percent of the country's drainage flows into this interior basin. The Orinoco's source is in the southern Guiana Highlands; it first flows northwestward, then north, and finally eastward to its delta, spreading to the Atlantic Ocean across a 265-mile-wide seafront. In the Orinoco's middle course, where it flows eastward through the wide Llanos, it is joined by tributaries from the Llanos interior, such as the Apure and Meta, and by other tributaries originating in the Guiana Highlands to the south, such as the Caroní. One unusual configuration occurs near the river's source, where, because of the almost level gradient, the Orinoco channel divides, one branch discharging southwest into the Casiquiare River, which joins the Negro, a tributary of the Amazon, the other branch continuing its northern flow through Venezuela.

The intermontane basins and valleys of the Andes and Coastal Range are drained mainly by other tributaries of the Orinoco. The Caracas valley is an exception, however; there the Tuy River runs eastward to the Caribbean. Landlocked Lake Valencia is Venezuela's only example of interior drainage, but it is steadily shrinking because of sedimentation and evaporation.

Lake Maracaibo is about 100 miles long from north to south and 75 miles in width at its widest. Short, fast-moving rivers run off the surrounding mountain slopes, depositing silt into the lake's shallow basin. A narrow strait connects Lake Maracaibo to the Caribbean, so that at its surface it contains fresh water in the south and brackish water in the north.

Relatively infertile reddish latosols are Venezuela's most common type of soil. Tropical heat and abundant moisture characteristically leach latosols of all but the most insoluble minerals, iron, and aluminum sesquioxides. These minerals are collectively known as laterite, and they give the soil its name and its distinctive red colour. Latosols are the characteristic soil of the Llanos and the Guiana Highlands except where alluvium is abundant. The country's most fertile soils are formed by such well-drained, transported material as river alluvium or recent volcanic deposits. Alluvial soils are found in the southern Maracaibo Lowlands, along the fringes of the Llanos where rivers draining the surrounding highlands have laid thick deposits of alluvium, and in the broad valley bottoms in the northern mountains. The Orinoco delta and adjacent plains are also rich in alluvium, though poor drainage is a problem with soils developed in these low areas. Volcanic soils cover the slopes of many of the northern mountains, but, though inherently fertile, these soils often suffer severe erosion because of deforestation and shifting agricultural practices.

Climate. Venezuela lies well within the tropics, and, despite regional variation in relief, precipitation, and vegetation, temperatures are relatively uniform across the country and vary little throughout the year. More than 90 percent of Venezuela has a mean annual temperature above 75° F (24° C), and altitude is responsible for the appreciable differences that do occur. The average mean temperature for Caracas, lying in a high valley, is, for example, about 72° F (22° C), while its nearby port of La Guaira averages about 81° F (27° C). Mérida, at more than 4,900 feet, averages 66° F (19° C), while low-lying Maracaibo, at sea level, averages 82° F (28° C). Day-to-night variations of temperature are more pronounced than month-to-month variations, a characteristic trait of the tropics.

Mean temperatures

Venezuela's climatic year is divided into two seasons; the wet season lasts from May to October and even continues sporadically through November, and the dry season begins in December and continues until the end of March. Regional variations in precipitation, however, are marked. Although lying in the northeast trade winds zone, only the northeastern coastal areas receive appreciable precipitation in the summer. The northwestern coastal regions experience descending air, and the resultant aridity can be severe, some places receiving less than 20 inches (500 millimetres) of rainfall annually. La Guaira, for example, receives an average of only 11 inches. Rain shadow areas behind coastal and upland ranges also receive little rain, while their corresponding windward slopes are generally

© Encyclopædia Britannica Inc

well watered. Inland, the Llanos and the southern interior of the country generally receive sufficient rainfall to support tropical savanna, lush tropical rain forest (selva), and cultivated cropland and grassland pastures.

Plant and animal life. Most of Venezuela's vegetation is tropical and nondeciduous or semideciduous, retaining foliage throughout the year or shedding it minimally. Altitude and rainfall variations determine differences in vegetation. Some two-fifths of the country is covered with forests and about half of it with savanna grasses; less than 5 percent of the land, mostly in the valleys of the Andes and of the coastal ranges, is under permanent cultivation. Altitudinal contrasts abound. True tropical growths do not generally flourish above 1,500 feet, although the selva intermingles with tall savanna grasslands in transitional zones in the interior; mangrove swamp is found in the Orinoco delta. The selva gives way to semitropical vegetation, reaching up to about 5,000 feet and characteristically supporting plant life that includes tree ferns and epiphytes, such as orchids. Higher up the Andean slopes, this fern forest gives way to a transitional zone of mountain vegetation, and above 10,000 feet is the *páramo* vegetation, which has few trees but a variety of small alpine shrubs and lichens. The drier northwestern coastal area, which was formerly covered with dry scrub woodland and grasses, has suffered from clearing, soil denudation, and overcultivation. Except in the remoter interior, indigenous and introduced species coexist on the forested slopes and around the settled lowland plains and valleys.

The fauna of Venezuela is essentially an assemblage of South American species found throughout the northern tropical forest and savanna areas of the continent. The indigenous variety is considerable. Seven species of the cat

Altitudinal variations in vegetation

family inhabit the forested interior, including the jaguar, ocelot, jaguarundi, puma, and margay. Several monkey species live in forested territories, among them the howler and spider monkey, the long-tailed capuchin, and the nocturnal durukuli. Other forest animals include two species of bear, two of peccary, two of deer, three of opossum, wild dog, and South American rodents, such as the agouti and the skunk. Among the more unusual breeds are the tapir, a large, prominently snouted, cloven-hoofed quadruped, and the aquatic, herbivorous manatee. Distinguished by its two flippers and spoon-shaped tail, the manatee is an inhabitant of coastal estuaries.

Inhabiting the remoter rivers, coastal lagoons, and swamps are several reptilians, including caimans, alligators, lizards, and several species of turtle. Many species of snakes, too, inhabit the forested interior; these include such venomous ones as coral snakes, striped rattlesnakes, and bushmasters, as well as such nonvenomous varieties as the boa constrictor and anaconda.

Reptilian life

Birds, both migratory and nonmigratory, are plentiful and diverse. The coastal swamps are the tropical venue for migratory cranes, herons, storks, and ducks. The ibis colonizes the Orinoco mangrove delta. Birds of prey are plentiful, thriving on the multitudes of migratory birds. The bellbird is prevalent in the Orinoco forests.

Pelagic and coral fish are plentiful off the Caribbean coast and the offshore waters of the Orinoco River, and the deltaic channels foster mollusks, young saltwater species, and shrimp. Swarming freshwater species in the interior rivers include electric eels and piranha. A wide array of catfish is caught for food.

Settlement patterns. *Regional disparities.* Agricultural development provided the stimulus for settlement and in-

Steel mill at Matanzas, part of the major industrial centre of Ciudad Guayana at the Orinoco–Caroní river junction.
Yoram Lehmann—Peter Arnold, Inc

tegration of a national urban network during the Spanish colonial period, the towns established serving as market and distribution centres; occasional short-lived finds of gold in the mountainous interior also prompted some boomtown development. Rural populations were, however, always small and dispersed because of the limited amount of arable and pasture land. Insect-borne diseases severely hindered settlement in the Orinoco region and in other low-lying river basins; traditionally population densities were greater in the mountain valleys, where the climate is moderated by elevation and where malaria and other health hazards were less endemic. In particular, Andean towns served as administrative centres that fostered agricultural and commercial enterprise, cultural contact and change, and the centralization of authority and privilege; they prospered and grew on the profits of hides, cacao, and indigo.

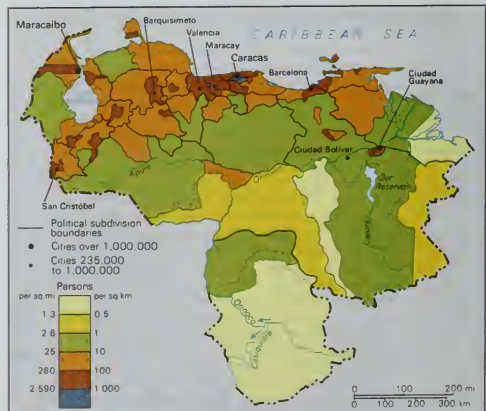
A century of independence beginning in 1830 consolidated the importance of the coastal ports, their hinterland administrative cities, and the growing dominance of Caracas as the hub of power, authority, and national wealth. The rural sector stagnated, while the northern urban network served as a conduit for the export of bulky raw materials, the importation of manufactured goods and foodstuffs, and the selective adoption of modern technologies in Caracas and La Guaira, including the telegraph and telephone, tramways, and railroads. Populations grew slowly in both rural and urban sectors, in part because of the prevalence of endemic diseases and the occurrence of natural disasters, and in part because of the economic stagnation that precluded mass immigration.

Urbanization. The uneven regional concentration of population has remained unchanged. With Caracas as its major focus, a major urbanized corridor consolidated in a relatively restricted zone of northern highland Venezuela during the period 1920–40. The oil boom in the Maracaibo Lowlands during the 1930s and '40s attracted some population from the Andean highlands, while elsewhere population concentrated in such flourishing agricultural and commercial centres as Barquisimeto, San Cristóbal, and Barcelona. Greater Caracas, however, was the primary focus of urban migration and immigration.

In modern Venezuela more than three-fourths of the people live in urban areas, with more than 40 percent residing in the four largest cities. A large and undocumented illegal immigration has contributed continuously to the urban growth rate. About one-sixth of the population lives in Greater Caracas, many of them recent migrants who inhabit the *ranchos,* or shantytowns; the second largest city is Maracaibo, followed by Valencia and Barquisimeto, all located in the north. In the eastern interior, Ciudad Guayana on the Orinoco has been growing rapidly.

The pace of urbanization in Venezuela between 1940 and 1970 was the most rapid in Latin America. In the 1940s this phenomenon caused mass rural depopulation. Rural outmigration was regionally concentrated. Whereas some rural communities, especially sparsely settled pioneer areas in the southern interior, experienced rapid growth after the eradication of many diseases, other rural communities in the densely settled highlands suffered sharp population

declines. These latter regions became marginal productive sectors of agriculture, their stagnating communities offering few if any opportunities to the rural youth. Agricultural neglect was symptomatic of these early years of oil production. The apparent effects of material gains and prosperity in the cities and the persistence of inequalities in land ownership (large estates, *latifundios,* underutilized their lands, while small farms, *minifundios,* were overcultivated) demonstrated that agriculture was no longer regarded as the best vehicle for material advancement. Viewing farming and rural living as old-fashioned and devoid of modernity and opportunity, the youth and other elements of rural population chose migration to the city.

The doubling of the urban population in only nine years between 1940 and 1949 and continued rapid growth in the 1950s caused vast sums to be spent on public housing, although only a fraction of the demand for urban shelter could be met. The majority of the poor had to resort to self-help strategies to acquire shelter, and the rapid burgeoning of uncontrolled, illegal *ranchos* on the hillsides surrounding the large cities was viewed with alarm. These communities have come to be accepted, if not promoted, as inevitable consequences of the rapid urban growth. Many *ranchos* have undergone transformation to more permanent housing structures, with improvements in services and political representation, and with a general upgrading of neighbourhood facilities. Many *ranchos,* however, continue to suffer from high densities, low-quality housing, deficient services, crime, and malnutrition and disease. Rates of rural and urban migration from other parts of Venezuela to Caracas have declined, but illegal immigration from neighbouring Colombia, most of it city-bound, has aggravated the *rancho* problem.


Population density of Venezuela.

Decentralization. The spatial arrangement of population and production in Venezuela has changed profoundly since the 1950s. During that period modern road building began, extending the main Andean axis of population between San Cristóbal and Caracas westward to the Gulf of Maracaibo and eastward through Valencia to the Lower Orinoco. The Caracas–Valencia area, however, remained the population–production core, a position that was further entrenched by the building of *autopistas* (expressways) between Caracas and La Guaira and Caracas and Maracay. Paved highways have linked this northern axis to the interior and along the coast.

In the 1960s Venezuela embarked on an ambitious four-year plan, in which the main thrusts were economic diversification, decentralization, and planned urban growth. The administration of Rómulo Betancourt addressed the problems of regional inequalities and uneven development by promotion of a new urban growth pole on the southern bank of the Orinoco River at its confluence with the Caroní, a planned metropolitan region that would exploit the great natural resources there—hydroelectric power and iron ore—and counterbalance the Caracas–Valencia metropolitan core region. Centred on a new city, Ciudad Guayana, this government-controlled, integrated development region was incorporated into the national economic planning framework. Developed as a heavy industrial complex, it includes a huge government-owned steel mill, and the government undertook a project to connect the region with the north by rail. An oil refinery and petrochemical complex already have been established in this interior region.

National planning calls for the development of other new metropolitan regional complexes to further counter the centralizing tendencies of Greater Caracas. National parks, forest reserves, and the encouragement of Amazonian tourism provide balance to the emphases on industrial expansion and diversification. Progress has been made in the construction of a national electric power grid, and bridges and tunnels have been built to improve contact between regions. Airport development has helped to open up the interior, as well as to improve contacts with trade and business partners. Regional imbalances continue to exist, but there has been steady progress toward correcting them.

THE PEOPLE

Ethnic composition. Venezuela is a country of immigrants, with only 2 percent of its population being made up of indigenous Indian groups. The dominant ethnic type, sometimes called *pardo,* is of mixed African, European, and Indian ancestry; the *pardos* constitute 69 percent of the population, whites make up another 20 percent, and blacks 9 percent. Perhaps as many as one-fourth of the contemporary population are immigrants, many illegal.

Prior to 1948, Venezuela had never openly encouraged non-Hispanic immigration, except for selective influxes of merchants, sailors, and entrepreneurs from neighbouring West Indian islands. In the late 1940s, however, stimulated by the development of a petroleum economy, a pro-immigration policy was adopted by the government. During a 10-year open immigration period, Venezuela recruited agricultural and skilled workers from Spain, Italy, and Portugal; at the same time emigration from Colombia to Venezuela also increased. Approximately one million immigrants entered the country between 1948 and 1958, although many of these eventually returned home. After 1958 the government tightened immigration controls, preferring a selective immigration that favoured foreigners with high-level skills. Colombians, however, continued to move into the rural sector during the 1960s as replacement labour for city-bound rural Venezuelans.

The mid-1970s petroleum boom marked another shift in immigration policies. A large demand for labour occurred, particularly semiskilled and skilled, in all sectors of the economy. At the same time, political instability and strife caused an exodus of professional and technical workers and their families from Argentina, Chile, and Uruguay, many of them relocating in Venezuela. After 1976 Venezuela again tightened its controls on immigration from other South American countries, favouring

professionals from the United States, Italy, Spain, and Portugal. Throughout this period of relative prosperity and expansion of the Venezuelan economy, the volume of illegal immigration matched that of legal entry. Particularly serving the unskilled sectors of the domestic economy, illegal immigrants came in large numbers from Colombia, Ecuador, and Peru. This alien population is thought to exceed two million, many of them females employed in domestic service. The large and rapid influx of foreigners, especially illegal Colombians, has generated a xenophobic outcry that is the cause of considerable political debate and concern.

Ethnic and racial groups are regionally oriented. Whites and mestizos are found mainly in the major cities. The Indian minorities survive only in the remote interior—in the Guiana Highlands and in the forests west of Lake Maracaibo. Peoples of African ancestry and the mulatto-mestizo groups predominate along the Caribbean coast. There are physiological distinctions between the highland and lowland mestizos, which reflect the Hispanic mixing with the Indian populations of the two regions.

The Indian groups speak more than 25 different languages, most of which belong to three linguistic families—Cariban, Arawak, and Chibcha. Spanish is the national language of the majority. Local idioms, colloquial phrases, and simplified verb usage distinguish Venezuelan Spanish from other Latin-American and Iberian variants. In Caracas and other major commercial centres, English is often favoured in business communications, and private schools in Caracas have come to encourage bilingualism in their students. The presence of English-speaking professionals in the oil centres and in the major cities has encouraged the establishment of English as the country's most popular second language.

Freedom of religion in Venezuela is guaranteed by the constitution, and, although more than 90 percent of the people are adherents of Roman Catholicism, religious tolerance is generally observed. Various Protestant sects form the largest minority group, and there are small groups of Jews and Muslims. Some Indian peoples continue to practice their traditional religions, but many have converted to Roman Catholicism. The Roman Catholic church, while officially apolitical, has become increasingly an instrument for social progress.

Demographic trends. Venezuela's 20th-century population growth has been among the most rapid in Latin America, prompted by high birth rates, declines in mortality rates, and successive waves of immigration. After World War II Venezuela's mortality rate began to drop with advances in medicine and technology to combat malaria and yellow fever; progress in the treatment of tuberculosis, typhoid, bronchitis, and dysentery; improvements in hygiene and diet; and the upgrading of housing conditions. While birth rates continued to remain at high levels, mortality rates, which had been as high as 30 per thousand before 1920, dropped to below 10 per thousand by the 1960s. Since that time the mortality rate has stabilized, and demographic changes have been mostly influenced by reductions in fertility levels and immigration rates.

Fertility rates, nevertheless, have remained relatively high, a condition that maintains a young population, more than 60 percent being under 30 years of age. Life expectancy rates have also been rising, a trend contributing to rapid population growth, with its accompanying challenge of creating economic opportunities for the new generation.

THE ECONOMY

The Venezuelan economy is based primarily on the production and exploitation of petroleum. Until 1970 the country was the world's largest petroleum exporter, but it was overtaken in that year. The modernization and diversification of its economy have been predicated upon the application of petroleum sector earnings to other economic sectors; "sowing the oil" ("sembrando el petróleo") has been the slogan since the 1940s. The potential for such diversification and economic growth has been expanded as a result of the discovery of rich deposits of iron ore, nickel, coal, and bauxite, as well as the development of hydroelectric potential.

"Sowing the oil"

During the 1960s Venezuelan governments stressed import substitution, within the context of protective tariffs and government subsidies. This led to an expansion of new export-oriented enterprises. In the mid-1970s the multinational hold on the Venezuelan oil and gas industries was effectively broken, and a nationalized industry was developed and used to underwrite the massive programs to expand economic infrastructure and public works.

The progress of Venezuela's programs based on "sowing the oil" was considerably set back because of such external conditions as the oil glut beginning in the late 1970s and the global recession of 1980–83, as well as internal problems of inflation, inefficient management, corruption, and deficiencies in skilled personnel. A growing foreign debt, rising unemployment, and illegal immigration were other pressures on the economy. Although its economic problems were becoming increasingly severe, there were some advances. Investments increased farm output, created a more diversified heavy and light industry, and furthered development of the country's natural resources; and at the same time two new planned industrial cities (Ciudad Guayana and El Tablazo) were created.

Resources. The largest and richest petroleum deposits in Venezuela are in the Maracaibo Lowlands. Other deposits include those in the eastern part of the Llanos, the Orinoco delta, and offshore. At the time of nationalization in 1976, production was dominated by several multinational firms, which together accounted for more than 80 percent of production. Refining was primarily accomplished offshore in Aruba, Curaçao, and elsewhere in the Caribbean. After nationalization a state-owned company, Venezuela Petroleum South America (Petróleos de Venezuela S.A.), assumed responsibility for production, but this industrial effort still depended heavily upon foreign oil companies to refine, transport, and market the oil and natural gas and to provide technical assistance. Venezuela also has abundant natural gas deposits; those discovered north of the Paria Peninsula in eastern Venezuela have received priority government development.

Venezuela is also a country rich in other mineral resources, which are largely underdeveloped. The major nonfuel mineral exploited is iron ore. The industry was developed on the basis of concessions granted for 50 years in 1950 to U.S. Steel and Bethlehem Steel to mine the ore in the region surrounding present-day Ciudad Guayana, at Mount Bolívar, and at El Pao. In 1975 the U.S.-owned mining operations were nationalized, and a government-owned corporation, Venezuelan Guayana Corporation, subsequently administered the operations and production.

In the mid-1970s large deposits of bauxite were discovered in the Guiana Highlands, much of this being high-grade ore suitable for alumina smelting in the Ciudad Guayana complex. Important mineral resources also include gold and diamonds in the Guiana Highlands, coal northwest of Lake Maracaibo, salt deposits in the Araya Peninsula, and scattered deposits of industrial-grade limestone. Other mineral resources include nickel, phosphates, copper, zinc, lead, titanium, and manganese, and surveys indicate the existence of substantial deposits of uranium and thorium. Inland and ocean fishing grounds and the inland forests are other less developed resources.

Apart from petroleum and natural gas, Venezuela's rivers constitute the most important source of power. The Caroní River, a major tributary of the Orinoco, has the largest hydroelectric potential. Also part of the Orinoco system, the Santo Domingo River, flowing out of the Mérida Range of the Andes, is the second most important power resource. There is also hydroelectric potential in the shorter course Andean rivers.

Agriculture, fishing, and forestry. Historically, agriculture has been one of the weakest and most neglected sectors of the Venezuelan economy. Only a very small part of the country (less than 5 percent) is used for crop production. Most of the cropland is in the northern mountains or in their foothills. Extensive cattle grazing is practiced in the Llanos and in a more limited way in the Maracaibo Lowlands. South of the Orinoco, the interior forests are farmed by shifting cultivation and in small, cleared riverine plots. Corn (maize) and rice are significant food crops.

Agriculture in Venezuela is organized broadly in three basic types of holding. First, commercial crop farms, *fincas comercializados,* usually more than 50 acres (20 hectares), use wage labour, have some mechanization, and use fertilizers and insecticides. These modernized farms have benefited from government initiatives toward the provision of credit and from higher prices in local and export markets. They produce sugarcane, cotton, and rice, often grown as plantation crops. The second type of holding is the family farm, *conuco,* invariably leased by the farmer; it is usually small in size, concentrating on food crops, such as corn and beans, for local consumption and on tree crops, mainly coffee and cacao, for sale in urban or overseas markets. Venezuela's main agricultural export is coffee. Many of the *conucos* are being consolidated as larger commercial units using immigrant labour from neighbouring Colombia. The third type are the large pastoral farms, *fincas granderas,* often more than 6,000 acres in area. These are established in the Llanos, where unenclosed land is used for grazing cattle on the low-quality grasses. The cattle are herded and traded in yearly meetings called *rodeos* (roundups).

Land reform programs were launched in the late 1950s and early 1960s in an attempt to alter the backwardness and stagnation of the small-farming agricultural sector. Relics of the colonial encomienda system, which supported a type of feudal landholding, led to the uneven distribution of land ownership that allowed some 2 percent of the owners to control about 80 percent of the land. Most rural workers could not own enough land to support their families. Some reform has been implemented in the Andes foothill areas, and more than 500,000 farm families have been reorganized, but the agricultural sector is still struggling to recover from centuries of neglect and the smallness of its resource base. Production has been expanding generally, if irregularly, but many foods still need to be imported.

Historically, fish have not been in great demand in Venezuela, and there has been only a moderate exploitation of the inland and ocean fishing grounds. A government enterprise established in the 1970s was designed to develop the fishing industry and increase the demand for fish, especially among the lower-income groups. Anchovies have been a major catch. A large part of the catch is sold fresh locally, but there is some exportation, particularly that of shrimp. Although more than 35 percent of the land is forested, the forestry industry has been slow to develop, mainly because of the remoteness of the richest forestlands. Also strict government conservation regulations have discouraged investment.

Industry. Until the 1950s Venezuela had little manufacturing industry apart from plants concerned with processing agricultural products and oil extraction. Huge oil revenues, combined with low tariffs on imported goods, permitted the importation of even the most simple of items. Since that time, and especially since the government's commitment to diversification of the economy in the 1960s, manufacturing has been transformed. Among the factors contributing to the industrial base are an abundant supply of oil, natural gas, and electrical power; a variety of raw materials; considerable capital available within the country; and a relatively high purchasing power per capita. The establishment of consumer goods and metalworking industries was accomplished under the protection of high tariffs and import quotas. As a result of the 1973–74 rise in world oil prices, government revenues expanded, and investment strategy was directed toward large-scale resource-based projects: iron and steel manufacturing, aluminum smelting, production of transport equipment, petrochemicals, and a foundry and metal engineering complex. This industrial progress slowed when oil prices went into decline several years later.

Venezuela's modern industries fall into three groups. First are the oil refineries and associated petrochemical plants. These are centred at such places as Morón near Puerto Cabello, which supports a petrochemical complex, and in Zulia state, where a large-scale petrochemical industry has been built at El Tablazo, on Lake Maracaibo. A second industrial group is engaged in the production of consumer

goods, much of which takes place in the Valencia–Maracay–Caracas area, with some parallel development at Barquisimeto. Import substitution items are the focus of this industry, including textiles, leather, paper, tires, tobacco, radios, television sets, and washing machines. The motor vehicle assembly industry is well established. A heavy industrial complex is centred on Ciudad Guayana in the Orinoco–Caroní region. A large integrated iron and steel works, at Matanzas near Puerto Ordaz, serves domestic needs and supplies a growing export market. In the same industrial complex, at San Tomé, Venezuela's aluminum industry has expanded from virtually nothing at the beginning of the 1980s to become one of the world's leading producers. Ciudad Guayana (margin note)

Finance and trade. Since 1958 the government has played a key role in the operation of Venezuela's financial system, largely through its management of the Banco Central de Venezuela (BCV), which sets interest rates, regulates the money supply, issues currency (the bolívar), and grants loans to commercial banks. Other state banks include the Banco Industrial de Venezuela, the Banco de los Trabajadores de Venezuela, and various regional banks. There are several privately owned commercial banks, as well as insurance companies. Most of these institutions, as well as the national stock exchange, are based in Caracas.

Venezuela was a leader in founding the Organization of Petroleum Exporting Countries (OPEC), and the country began to receive windfall profits after OPEC raised oil prices by more than 400 percent in 1973–74. The huge oil revenues increased Venezuelan influence in Latin America, and the country negotiated favourable trade agreements to supply its neighbours with oil and natural gas.

Venezuela experienced severe economic problems following a Latin American debt crisis in 1982 and a collapse of world oil prices in 1986. Among its pressing concerns were the loss of foreign-exchange reserves, slowed economic growth, and rising inflation. In response to these issues, Venezuela in 1989 signed agreements with the International Monetary Fund and World Bank. Its balance of payments and other factors subsequently improved, and the state again increased its expenditures. However, many of the country's financial problems returned during the 1990s, brought on by fluctuating oil revenues, political instability, a banking crisis in 1994, and mismanagement and overborrowing from the BCV. The government removed financial controls, sold many banks to foreign and domestic investors, and privatized several other industries. However, these measures were only partially successful: state expenditures remained high, and the economy continued to depend largely on oil revenues, which rose again during 1999–2001.

The main feature of Venezuela's external trade continues to be oil, which represents some three-fourths of export earnings. Venezuela has maintained a positive trade balance, although servicing the national debt (principal and interest) has risen to one-fifth of the federal budget. The United States is Venezuela's primary trading partner, accounting for roughly half of imports and exports. Other trading partners include Colombia, Brazil, and Germany. Venezuela is a member of the Latin American Free Trade Association (LAFTA) and the Andean Pact.

Major trading partners (margin note)

(E.C./I.M.S.S./Ed.)

Transportation. The nation's transportation system is well developed, especially in the densely populated northern and northwestern regions. Domestic travel depends largely on roads, while industrial transport is served by coastal shipping routes and inland waterways. Air services provide access to otherwise isolated regions.

There are three major trunk roads—a section of the Pan-American Highway that runs southwestward from Caracas through Valencia and Barquisimeto to San Cristóbal and then into Colombia; the northwestern highway, which runs from Valencia to Coro and on to Lake Maracaibo; and the Llanos Highway, which extends eastward from Caracas to Barcelona, Cumaná, and beyond. A branch also runs from Barcelona across the Llanos to Ciudad Bolívar.

Railways, for both passenger and freight transport, are relatively unimportant. One public line runs northeastward from Barquisimeto to Puerto Cabello on the coast and on to Caracas. Private railways serve the iron and steel industry, connecting mines in the Guiana Highlands region to Ciudad Guayana.

Almost all of the nation's foreign commerce is carried by sea. There are a number of ports, of which several are used by international shipping; many small ports serve fishing or coastal trade purposes. Inland waterways are utilized principally around Lake Maracaibo and on the Orinoco River. A dredged channel between the Gulf of Venezuela and Lake Maracaibo allows seagoing vessels to dock at the ports of Maracaibo, Bobures, and La Salina. A dredged channel through the Orinoco delta permits seagoing vessels also to sail upriver to Ciudad Guayana.

Ocean shipping (margin note)

Transoceanic and intercontinental air routes use Venezuelan international airports as a stopover. Simón Bolívar Airport, located at Maiquetía 10 miles by road from Caracas, is the busiest airport, servicing international and domestic flights.

GOVERNMENT AND SOCIAL CONDITIONS

Government. The Venezuelan constitution of 1999 prescribes a government based on republican, democratic, and federalist principles. Citizens age 21 and older are eligible to vote. All males have had this right since 1872, but universal suffrage was not instituted until 1946. During the period 1961–99, the constitution prescribed a government led by a directly elected president, as well as a bicameral legislature and a multitiered judicial branch. As economic difficulties mounted during the 1980s and '90s, so, too, did criticism of political corruption. In 1999 Hugo Chávez Frías, the newly installed president, pushed for radical reforms, and the new constitution was adopted by referendum in December. The constitution fundamentally changed the executive and legislative branches, reformed the judiciary system, acknowledged the rights of indigenous peoples, and changed the country's name from Republic of Venezuela to Bolivarian Republic of Venezuela.

Executive power is vested in the president, who serves a six-year term and is eligible for reelection to a second consecutive term. The president wields a greater amount of power than either the judicial or legislative branches of government. In addition to acting as the head of state, the president is the commander in chief of the armed forces. The president appoints an executive vice president and a Council of State, the members of which act as ministers.

The unicameral National Assembly (Asamblea Nacional) consists of 165 members (deputies), who are popularly elected through a combination of proportional and direct representation, including three deputies elected by the nation's indigenous peoples. Deputies are eligible to serve a maximum of two consecutive five-year terms. Under certain conditions the president may dissolve the assembly.

The judiciary is organized nationally, with no autonomous state courts. At the highest level is the Supreme Court of Justice (Tribunal Supremo de Justicia), which adjudicates civil, criminal, and political cases. Its members are appointed to 12-year terms by the National Assembly. Venezuelans generally enjoy a high degree of individual liberty, but protests have grown over the lack of legal protection for the nation's Indian population.

Two of the nation's several political parties dominated politics until 1993: Democratic Action (Acción Democrática) and the Social Christian Party (Partido Social Cristiano). However, in the 1998 presidential elections, these parties virtually collapsed and the main presidential contenders represented new political movements.

The country is divided into 23 states and the federal district, which includes Caracas. Each state is headed by a directly elected governor and has a legislative assembly. The federal district is administered by a mayor, and day-to-day administration elsewhere in the country is the responsibility of municipal councils and directly elected mayors.

Education, health, and welfare. Modernization and the integration of the country's urban network in the 20th century has brought considerable improvement in the provision of education and of health and welfare services and in governmental support for training and technical skill acquisition, particularly in the major cities.

Education. Preschool and nine years of basic education

is free and compulsory. Private schools play a significant role at the primary and secondary levels. The number of institutions of higher education expanded rapidly between the late 1950s and the early 1980s. Higher education is provided by private and public institutions, and approximately 20 percent of secondary school graduates attend them. Caracas is an educational centre with several notable universities, including the Central University of Venezuela and the National Open University. Several of the states have major universities, among the largest of which are the University of Zulia and the University of Carabobo.

Health and welfare. The government has greatly expanded health and welfare services, again particularly in the cities. Medical assistance is both public (free) and private. The Ministry of Health is responsible for the organization and staffing of the public hospitals and rural medical centres. The Venezuelan Institute of Social Security Insurance offers medical and welfare assistance to urban workers and employees. In the area of housing, however, the metropolitan authorities have been unable to render sufficient support to supply the needs of the urban poor and the cityward migrants. The problems of the *ranchos* persist as public housing schemes meet mainly the needs of middle-income groups. Lower-income groups are left largely on their own to find employment.

The Ministry of Health

CULTURAL LIFE

Cultural traditions. In Venezuela, as in many Latin-American countries, the rich popular culture of the rural campesinos reflects a blending of Roman Catholicism and traditional folkways. The rural culture, however, was paralleled by the development of an elite culture, predominantly urban-based and European-oriented but distinctly Venezuelan in form. The rapid cityward migrations of the more dynamic and youthful segments of rural communities brought to the *ranchos* some of the local folk traditions, but much of the regional flavour was lost. Colonial Hispanic traditions continue to persist, however, in spite of the North Americanization of Venezuelan urban life. For example, compadrazgo (co-parenthood; a set of social and moral obligations between a child's parents and godparents) is a deeply held family tradition that is retained by the urban classes. The vast inequalities in Venezuelan society are reflected in the nation's two distinctive cultural milieus—one elite, modernized, and externally oriented; the other nationalistic and selectively folk-oriented.

The arts. In an effort to maintain cultural autonomy in the face of foreign influences, the government has, since the 1920s, supported nationalistic artistic expression. Greater freedom for writing and publishing prompted the flourishing development of national literature. Emerging in this wave of nationalistic influence was Rómulo Gallegos, who became Venezuela's best-known writer; he received international recognition for his novel *Doña Bárbara* (1929). Such painters as Armando Reverón and Manuel Cabré also expressed nationalistic fervour. The architect Carlos Raúl Villanueva won international acclaim for his design of asymmetrically arranged buildings, complemented by freestanding murals and sculpture, at the Central University in Caracas. The state-supported Venezuelan Symphony Orchestra is highly popular, and its repertoire reflects as well a spirit of nationalism. Each of the regions has its own distinctive musical expression.

Cultural institutions. Most of Venezuela's major cultural institutions are located in Caracas. The Museum of Fine Arts, founded in 1938, houses a large collection of national and foreign paintings and sculptures. Other museums include the Museum of Colonial Art, housed in an 18th-century mansion, and the Museum of Natural Science (founded in 1940), which contains more than 20,000 exhibits. Among the noteworthy museums outside Caracas are a pre-Columbian museum in Ciudad Bolívar and the Museum of Military History in Maracaibo. The most important library is the National Library in Caracas, with holdings of more than two million volumes, including a large collection of rare books.

Recreation. Venezuela continues to struggle against foreign influences to retain such traditional pastimes as the *toros coleados,* a form of bullfighting in which the bull is thrown by its tail. Nonetheless, there have been widescale adoptions of such North American pastimes as baseball, now the national sport. Carnival, the two days preceding Ash Wednesday, is the major holiday (fiesta) in Venezuela, particularly in Caracas. On these days business comes to a halt as games, races, and street celebrations prevail. Other important holidays are the New Year and, in rural areas, the local saints' days.

Carnival

Press and broadcasting. Caracas is the national press centre, and its newspapers are widely available throughout the interior. The majority of newspapers, including the two leading dailies, *Ultimas Noticias* and *Meridiano,* are independent and generally operate with little government interference. In addition, political parties and labour unions publish their own newspapers. Television broadcasting is available to more than 80 percent of Venezuelans. *Telenovelas* (soap operas) are the most important genre, followed by variety programs. Venezuela has decreased its dependence on American and European programs, an indication of the increasing trend to produce more programs domestically.

For statistical data on the land and people of Venezuela, see the *Britannica World Data* section in the BRITANNICA BOOK OF THE YEAR.   (D.Co./I.M.S.S.)

History

The oldest inhabitants of Venezuela were primitive food-gathering Indians who arrived in the Late Paleolithic period. There followed, successively, invasions by other food-gathering groups, by community-dwelling Arawak, and by warlike, cannibalistic Caribs. The most advanced Venezuelan Indians were the farming tribes of the Andes; nomadic hunting and fishing groups roamed Lake Maracaibo, the Llanos, and the coast.

THE COLONIAL ERA

Christopher Columbus arrived in what is now Venezuela in 1498, during his third voyage to the New World. According to some historians, the region was named by Amerigo Vespucci, who, on seeing the native Indian houses built on stilts over water, called it "Little Venice," or Venezuela. The first quarter century of European contact was limited to the northeast coast and confined to slave hunting and pearl fishing; the first permanent Spanish settlement, Cumaná, was not made until 1523. In the second quarter of the 16th century, the centre of activity shifted to the northwest region, where the Welser banking house of Augsburg purchased exploration and colonization rights; German attempts to find precious metals and to occupy the area failed, however, and Spain repossessed the area in 1546.

European contact

In the latter half of the 16th century, Spanish agriculturalists, using Indian slave labour, began effective colonization. Caracas was founded in 1567, and by 1600 more than 20 settlements dotted the Venezuelan Andes and the Caribbean coast. During the 17th and 18th centuries, the Llanos and Maracaibo regions were taken over gradually by various Roman Catholic missionary orders.

The colonial economy was based on agriculture and stock raising. Corn (maize), beans, and beef were the domestic consumption staples; sugar, cacao, tobacco, and hides were the principal exports. Spain's European rivals, the French and English in the 16th century and the Dutch in the 17th century, succeeded in taking over most of Venezuela's commerce until the early 18th century, when Spain established a monopoly trading company. The interests of the latter, however, proved contrary to those of Venezuelan producers, who forced dissolution of the company during the 1780s.

Venezuelan society during the colonial era was headed by agents of the Spanish crown. Royal bureaucrats monopolized the top governing posts, and Spanish clergymen dominated the high church offices. Creoles (native-born whites), however, owned the colony's wealth, principally land, and used it to hold the nonwhite races in bondage: mestizos (persons of mixed ancestry) were generally without property, social status, or political influence; Indians performed forced labour on interior farms or were segre-

Creole domination

gated on marginal lands; blacks were slaves on the coastal plantations. In theory, Venezuela was governed by the Spanish crown through the Audiencia of Santo Domingo in the 16th and 17th centuries and through the Viceroy of New Granada (at Bogotá) from its incorporation in 1717. In practice, however, the Venezuelans exercised a great deal of local autonomy throughout the colonial era.

THE INDEPENDENCE MOVEMENT

A group of Venezuelan Creoles boldly proclaimed their country an independent republic in 1797. Although their effort failed, it forewarned of the revolutionary movements that were soon to inflame Latin America.

In 1806 Francisco Miranda—who had earlier fought under George Washington against the British, served as a general in the French Revolution, and fought with the French against Prussia and Russia—tried unsuccessfully to land on the Venezuelan coast with a group of mercenaries whom he had recruited in New York City. He was recalled to his country four years later, set up a revolutionary junta, had a constitution drafted, and established an independent nation with himself as dictator. In the ensuing war with royalist forces, however, he surrendered to the Spaniards, who sent him first to Puerto Rico and later to Spain, where he died in prison in 1816.

Early in 1813 the revolutionary junta appointed Simón Bolívar commander of the Venezuelan forces. Born in Caracas in 1783 of a wealthy family of Creole landowners, Bolívar had long been a leader in the independence movement. He suffered many reverses in his war against the Spanish forces but was helped by the new Republic of Haiti and by a foreign legion of British and Irish soldiers. The Republic of Gran Colombia, with its capital at Bogotá, was proclaimed on Dec. 17, 1819, and on June 24, 1821, Bolívar defeated the royalist army in the Battle of Carabobo; the last of the royalist forces surrendered at Puerto Cabello on Oct. 9, 1823. In 1824 Bolívar marched south to liberate Peru, and the following year he freed Bolivia from Spanish rule.

During his absence regional rivalries broke out in Gran Colombia, and his prestige was not enough to hold the country together after his return. Venezuela broke away in 1829, and Ecuador soon after. Bolívar died in Santa Marta, Colombia, in 1830, penniless and disillusioned. Today he is honoured as the principal architect of Venezuelan and Latin-American independence.

THE CAUDILLOS (1830–1935)

After the destruction of the colonial system, Venezuela passed through an era of government-by-force that lasted well over a century, until the death of Juan Vicente Gómez in 1935. Backed by their personal armies, much on the order of the later Chinese warlords, a series of caudillos (leaders) assumed power, which they exercised for their personal benefit rather than for that of the nation.

Páez and the Conservatives. The first of the military dictators was General José Antonio Páez, who gave the country better government than it would see again for nearly a century. Bolívar had left Páez in charge of the armed forces of Venezuela, and he was soon in full control of the country. He led the separation movement from Gran Colombia in 1829 and in 1830 convoked a constitutional convention to draw up a separate constitution for Venezuela. He dominated Venezuelan politics throughout the period 1830–48; he was president from 1831 to 1835 and was elected to another four-year term in 1839. He established law and order by subduing ambitious provincial caudillos. Páez ruled in cooperation with the large landholders and leading merchants of the Conservative Party. The constitution that they enacted in 1830 reflected their social and political philosophy—a centralist state, property qualifications for voting, death penalty for political crimes, freedom of contracts, and continuance of slavery. The church lost its tax immunity and its educational monopoly, and the army was shorn of its autonomy; thus, state supremacy was achieved. Stability thus assured, reconstruction of the war-torn economy began. Government finances were put in order, the nation's credit was firmly established abroad, and amortization of the national debt

was begun. Construction of new roads promoted interior commerce and the export of coffee and cacao.

In contrast to the troubled times that preceded and followed it, the 1830–48 period of Conservative Party domination was an era of political stability, economic progress, and responsible administration. An opposition movement began to develop in 1840, however, when Antonio Leocadio Guzmán, the leading spokesman for dissident merchants and professional men, founded the Liberal Party. Guzmán's new liberal newspaper, *El Venezolano,* demanded abolition of slavery, extension of voting rights, and protection for the debtor classes. Declining demands in the world market for Venezuela's agricultural commodities during the 1840s produced economic difficulties, which in turn contributed to the increasing opposition to the Conservative oligarchy.

The Monagas and the civil wars. The growing political crisis was brought to a head in 1848 by General José Tadeo Monagas. Although elected president as a Conservative in 1846, he soon gravitated toward the Liberals. He intimidated the Conservative congress and appointed Liberal Party ministers. When Páez rebelled in 1848, Monagas defeated him and forced him into exile.

The decade 1848–58 was one of dictatorial rule by José Tadeo Monagas and his brother, General José Gregorio Monagas, who alternated as president during the period. Liberal Party laws were passed abolishing slavery, extending suffrage, outlawing capital punishment, and limiting interest rates, but they were not implemented. Integrity in government waned; heavy deficit financing ruined the nation's credit; the economy began to stagnate and decay. In 1857 the Monagas brothers attempted to impose a new constitution extending the presidential term from four years to six and removing all restrictions on reelection. The Liberal leaders thereupon joined the Conservative opposition, and in March 1858 they brought the Monagas dynasty to an end. This first successful rebellion in Venezuela's national history set off five years of revolutionary turmoil between the Liberals and Conservatives. The issues in these so-called Federalist Wars were, on the Liberal side, federalism, democracy, and social reform and, on the Conservative side, centralism and preservation of the political and social status quo. The conflicts were extremely bloody, and control of the central government changed hands several times. General Páez returned in 1861 to restore Conservative hegemony for two years, but in 1863 final victory went to the Liberals, led by the generals Juan Falcón and Antonio Guzmán Blanco.

A new constitution enacted in 1864 incorporated the federalist principles of the victors. Local freedoms quickly disappeared, however, at the hands of provincial caudillos. As president in 1864–68, Falcón appeared content to allow subordinates, many of them irresponsible, to rule at both the state and national levels. Liberal mismanagement and increasing political chaos provided an opportunity for the Conservatives, now led by José Tadeo Monagas, to return to power in 1868. But civil war followed. General Guzmán Blanco rallied the Liberals to his cause, overthrew the Conservatives, and assumed power in 1870.

The reigns of Guzmán Blanco and Crespo. Guzmán Blanco's triumphal entry into Caracas in April 1870 halted the political chaos and economic stagnation that had plagued the nation since 1858. The new president took the field himself and pacified the country in less than two years; he thereupon launched a broad program of reform and development. A new constitution in 1872 proclaimed representative government, universal suffrage, and direct election of the president. Economic reforms, such as restoration of the nation's credit by means of new bond issues and liberal concessions to foreign investors, gave further evidence of Guzmán Blanco's apparent devotion to Liberal Party principles. He ordered establishment of a nationwide system of public primary education and liberal state support for secondary and higher education. He not only abolished ecclesiastical privileges, cut off state subsidies to the Roman Catholic church, proclaimed religious liberty, and legalized civil marriage but also confiscated church properties, exiled the archbishop, and closed the convents.

Guzmán Blanco was the popular choice for president in the 1873 election. He departed for Europe in 1877, leaving a puppet successor in charge; but when the opposition rebelled, he returned to crush it and resumed the presidency in 1878. The following year he returned to Europe, leaving General Joaquín Crespo in charge. Guzmán Blanco came back again in 1886 to serve a final two years in the face of growing popular opposition to his policies.

Unquestionably, Guzmán Blanco's regime had both positive and negative results for the nation. His admirers point to his political and military genius and to his administrative, economic, educational, and religious reforms. His detractors emphasize his tyrannical ruling methods, his financial chicanery, his monumental vanity, his superficial educational reforms, and his unwarranted attacks upon the church. For four years after the end of his regime, Venezuela floundered in new political chaos as various civilian political groups tried unsuccessfully to establish responsible representative government. In October 1892 Crespo seized power. His six-year rule was troubled by continued political turmoil, growing economic difficulties, and the nation's first serious diplomatic problem—concerning a dispute with Great Britain over the boundary between eastern Venezuela and western British Guiana. This jungled no-man's-land, in which gold was discovered in 1877, had been the object of alternating claims and counterclaims between Venezuela and Great Britain for more than half a century. Great Britain repeatedly refused Venezuela's requests to refer the matter to arbitration, and in 1887 Venezuela suspended diplomatic relations. President Crespo appealed to the United States, and in 1895 U.S. president Grover Cleveland pressured Britain to arbitrate. An international tribunal handed down a decision in 1899 that failed to satisfy Venezuela's demands.

The Andinos. The turn of the century was a turning point in Venezuelan history. In 1899 General Cipriano Castro, a caudillo from the Andean state of Táchira, descended with his provincial army upon Caracas and seized the presidency. For the next 59 years, except for an interlude in 1945–48, five successive military strongmen from Táchira, known as Andinos, controlled the nation. Castro ruled from 1899 to 1909. His regime was characterized by administrative tyranny, financial irresponsibility, almost constant domestic revolt, and frequent foreign intervention. The most serious internal uprising occurred in eastern Venezuela in 1902–03. This and subsequent revolts of the early part of the century were put down by General Juan Vicente Gómez. Castro's cavalier treatment of foreign businessmen and diplomats and his refusal to pay for foreign properties damaged in domestic insurrections resulted in a British-German-Italian blockade of the Venezuelan coast in 1902–03 and a Dutch attack upon Venezuela's navy in 1908. Ill health forced Castro's departure for Europe for medical attention in 1908, whereupon Gómez usurped the presidential powers and did not relinquish them until his death 27 years later.

Gómez was an effective dictator. By manipulating elections, abolishing all organized political activity, and monopolizing appointive powers, he was able to establish a completely subservient legislative and judicial structure. He muzzled the press and stifled the opposition with an elaborate spy service, and he used arbitrary arrests, exiles, long imprisonments, and assassinations to insure his control. Efficient police and army organizations maintained his power through unrestricted use of force.

Political order and liberal concessions attracted foreign petroleum investors. Dutch and British petroleum interests entered Venezuela just before World War I; immediately after the war Standard Oil interests from the United States arrived to compete with the British and Dutch. By 1928 Venezuela had become the world's leading exporter of oil and was second only to the United States in oil production. The oil industry brought the nation such benefits as high-paying jobs, subsidies to agriculture, expanded government revenues, and increased trade. Networks of roads, railroads, and port facilities were constructed; the entire foreign debt was paid off; and the large domestic debt was drastically reduced. Yet the oil prosperity was unevenly distributed; most Venezuelans continued to live

(margin note: Castro and Gómez, 1899–1935)

in poverty, and their health, housing, and education needs were ignored by the state. Meanwhile, Gómez and the top bureaucrats and army officers enriched themselves; the dictator became the nation's wealthiest citizen, retaining power until his death, from natural causes, in 1935.

VENEZUELA SINCE 1935

Eleazar López Conteras, who had been war minister under Gómez, succeeded him and served as president until 1941. López restored civil liberties, sanctioned political activity, and permitted labour to organize during 1936; but he restored the dictatorship in 1937, when the opposition became too threatening. In 1938 he inaugurated a three-year development plan that included construction of public schools and hospitals and support for agriculture and private industry.

Isaias Medina Angarita, a fellow Táchira general, was president in 1941–45; he continued this development program and also restored political liberties. A World War II transportation squeeze resulted in a sharp decline in petroleum revenues during 1941 and 1942, and President Medina revised upward—under a 1943 oil law—the nation's share in the profits of the petroleum industry. As the transportation shortage eased and new concessions were granted, a petroleum boom was stimulated.

In October 1945, at the height of the wartime prosperity, the Medina administration was suddenly overthrown. This revolution marked the first assumption of power in Venezuela by a political party (Democratic Action) that had the support of a majority of the people. Party leader Rómulo Betancourt headed a civilian-military junta that ruled the nation for 28 months. On July 5, 1947, a new constitution reflecting the labour-leftist philosophy of the party was adopted, and in December 1947 novelist Rómulo Gallegos was elected to the presidency.

Democratic Action promptly launched a program of reform: a fifty-fifty tax decree assured the nation of at least half the profits of the petroleum industry; labour was encouraged to organize and to bargain for its rights; and governmental support was granted for health, housing, and education and for agricultural and industrial development. These reforms provoked strong opposition from conservative forces that culminated in a November 1948 military coup. The new ruling junta was headed by Lieutenant Colonel Carlos Delgado Chalbaud and Major Marcos Pérez Jiménez; two years later the former was assassinated, and the latter took power.

Thus, from 1951 to 1957 the nation was again controlled by a Táchira military dictator. Pérez Jiménez outlawed political activity, crushed the labour movement, closed down the universities, and muzzled the press. Democratic Action's nationwide reform programs were abandoned in favour of modernizing Caracas and enriching the dictator and his army associates. Finally, popular opposition grew so great that the navy and air force joined to overthrow Pérez Jiménez in January 1958. A civilian-military junta ran the country for one year, after which Rómulo Betancourt was elected president.

The second Betancourt administration (1959–64) was considerably more moderate than the first. This time Democratic Action, in contrast to its earlier exclusivism, cooperated with its next largest party, the middle-of-the-road Christian Democrats, and set up a coalition government. This government launched programs designed to modernize agriculture, develop domestic industry, improve the nation's health, and eliminate illiteracy. In 1960 it passed an agrarian reform law, and in 1962 it inaugurated a national steel industry.

Despite broad developmental progress, the Betancourt administration was troubled by political unrest and economic crisis. To complicate matters, a sharp depression occurred in 1960–63. In foreign affairs Venezuela severed diplomatic relations with the Dominican Republic in 1960 (after Dominican agents attempted to assassinate Betancourt) and broke relations with Cuba in 1961 (following repeated Cuban attempts to aid the Venezuelan Communists).

The 1963 presidential elections, held in an atmosphere of great political tension, were narrowly won by the

(margin note: Prosperity, reform, and military rule, 1935–58)

(margin note: Democracy and economic nationalism, 1959 to the present)

Democratic Action candidate Raúl Leoni. The Christian Democrats thereupon withdrew from the governing coalition, but they were replaced by the labour-leftist Democratic Republican Union. The oil and iron ore industries began to boom once more, and a new petrochemical industry was launched. Although prosperity had returned, growing popular dissatisfaction strengthened the opposition Christian Democrats, whose presidential candidate, Rafael Caldera, won the 1968 elections.

Caldera's inauguration in 1969 marked the first time in Venezuela's history that an incumbent government peacefully surrendered power to an opposition electoral victor. The programs of the Christian Democrats were similar to those of Democratic Action. Caldera improved relations with Cuba, the Soviet Union, and the Latin-American military dictatorships. In the early 1970s Venezuela took majority ownership of foreign banks, took control of the natural gas industry, and declared a moratorium on the granting of oil concessions. (E.Li./J.D.Ma.)

President Carlos Andrés Pérez Rodríguez, the Democratic Action victor in the 1973 elections, nationalized the iron ore industry in 1975 and the petroleum industry the next year. Following the Arab-Israeli War of 1973, Venezuela, as a founding member of OPEC, more than tripled the

Oil wealth | price of its oil. The resulting windfall triggered a wave of spending that attracted tens of thousands of South American immigrants, increased imports of food and luxury items, produced growing waste and corruption, and created a privileged economic elite, but it did little to alleviate poverty. The economic boom did not last, however. An international recession and oil glut beginning in the late 1970s slashed world oil prices and plunged the country into economic stagnation. This condition, continuing into the late 1980s, was reflected in a downward trend in the gross domestic product and a steady increase in inflation; exports declined, and unemployment became a major concern. The accompanying loss of confidence in the economy caused an enormous increase in capital flight, as investors rapidly divested themselves of Venezuelan securities and shifted their capital to foreign markets. That problem and the government's inability to repay foreign debt reached crisis proportions during the administrations of the Christian Democrat Luis Herrera Campins, elected in 1978, and Democratic Action's Jaime Lusinchi, elected in 1983. Herrera Campins devalued the currency for the first time in two decades. Lusinchi adopted limited austerity measures and began to reschedule foreign debt.

The Lusinchi government's economic policies only softened the impact of external forces. By 1988 another drastic decline in world oil prices had cut government income in half, and payment of the foreign debt—which Lusinchi had continued as scheduled—became increasingly difficult. In December of that year the electorate returned to office former president Pérez, who pledged to develop a regionwide plan to deal with the foreign debt. Domestically, he sought to stimulate new growth. His succession of Lusinchi marked the first time in 25 years that the governing party had retained the presidency in an election. President Pérez's popularity was short-lived, however, as riots broke out in reaction to a rise in bus fares, which was part of a package of austerity measures that Pérez had announced in early 1989. Massive looting took place, and troops killed hundreds of people while attempting to put down the disturbances.

The next two years were filled with protests, labour strikes, and an increasingly heated political debate as Pérez attempted to reduce tariffs and decrease government intervention in the economy. In 1992 a small group of junior army officers, led by Lieutenant Colonel Hugo Chávez

Coup led by Hugo Chávez | Frías, attempted a coup against President Pérez, and later that same year air force officers staged a second coup attempt. Pérez survived these two incidents but subsequently was charged with misappropriating public funds; he was forced to leave office early, in mid-1993.

Following two brief interim presidencies, national elections were held in late 1993. Running as an independent, former president Caldera came back to office. The banking system was in crisis as Caldera took power in 1994, and his administration experimented with a series of pop-

ulist economic plans before turning to negotiations with the International Monetary Fund. Caldera also released from prison the coup leader Chávez before his trial had ended, thus making Chávez eligible to run for public office.

By the 1998 elections more than half the Venezuelan populace was below the poverty line, while annual inflation exceeded 30 percent and oil prices sank precipitously. The voters rejected the traditional political parties and elected Chávez president. At the same time, his coalition became the largest voting bloc in the legislature. Chávez pledged to rid the country of corruption, help the poor, reduce the power of the elite, and remake Venezuelan democracy by writing a new constitution. In mid-1999 Venezuelans elected a constituent assembly dominated by pro-Chávez delegates, and voters soon approved a new constitution by referendum. In July 2000 Venezuelans reelected Chávez to the presidency and his coalition to a majority in the National Assembly. Chávez subsequently acted to make Venezuela more diplomatically independent from the United States. Chávez faced opposition to many of his proposed changes, and the implementation of his economic reforms in 2001 prompted massive protests and strikes. In April 2002 a coup briefly ousted him from office, but Chávez was reinstated within two days after protests from his supporters and after troops loyal to him threatened a rebellion. | Election of Chávez

In December 1999 a severe rainstorm brought on mud slides and flash floods that ravaged communities along the mountainous northern coast, including sections of the Caracas metropolitan area. Hundreds of thousands of structures were damaged or destroyed, and estimates of the dead ranged from a few thousand to tens of thousands. Following the cataclysm, the nation focused its efforts on reconstruction projects and emergency aid, including resettling thousands of homeless families.

For later developments in the history of Venezuela, see the BRITANNICA BOOK OF THE YEAR.

Venice

An island city, the greatest seaport in late medieval Europe and its commercial and cultural link with Asia, Venice (Italian: Venezia) is unique environmentally, architecturally, and historically. In its days as a republic, the city was styled *la serenissima* ("the most serene" or "sublime"). It remains a major Italian port in the northern Adriatic and is the capital of Venezia *provincia* (province) and of the Veneto *regione* (region).

Since the fall of the Venetian republic in 1797, the city has held an unrivaled place in the Western imagination and has been endlessly described in prose and verse. The luminous spectacle of marbled and frescoed palaces, towers, and domes reflected in the sparkling waters of the lagoon under a blue Adriatic sky has been painted, photographed, and filmed to such an extent that it is difficult to distinguish the real city from its romantic representations. The visitor is still transported into another world,

one whose atmosphere and beauty remain incomparable.

Today Venice is recognized as part of the artistic and architectural patrimony of all humanity, a fitting role for a city whose thousand-year economic and political independence was sustained by its role in global trading. The situation of the city on islands has limited modern suburban spread beyond the historic centre; its framework of canals and narrow streets has prevented the intrusion of automobiles; and its unmatched wealth of fine buildings and monuments has ensured a keen and almost universal desire for sensitive conservation. This desire is now extended not just to the city's monuments but to the very city itself, as rising water levels and subsidence of the land upon which Venice is built threaten the continued existence of the city in its present form. In 1987 Venice and its lagoon were collectively designated a World Heritage site.

This article is divided into the following sections:

Physical and human geography

THE LANDSCAPE

Site.   Situated at the northwestern end of the Adriatic Sea, Venice lies on an archipelago in a crescent-shaped lagoon that stretches some 32 miles (51 kilometres) from the reclaimed marshes of Jesolo in the north to the drained lands beyond Chioggia at the southern end. The shallow waters of the lagoon are protected by a line of sandbanks, or *lidi*, whose three gaps, or *porti*, allow passage of the three-foot (one-metre) tides and the city's maritime traffic. On the sandbanks are many small settlements, some of them centuries old. The best known is the Lido itself, built as a fashionable seaside resort in the 19th century.

Terraferma.   Although Venice may aptly be regarded as an isolated sea city, it has always had close links with the surrounding marshlands and the mainland of northern Italy. The Venetian republic included the perimeter of the lagoon, the *dogado;* and, from the early 15th century, amassed a large land empire known as *terraferma* ("dry land"), stretching from the Istrian Peninsula, of Slovenia and Croatia, to the borders of Milan and from the Po River to the high Alps. From the 16th century onward, the Venetians invested heavily in the purchase, reclamation, and drainage of *terraferma* lands. The imprint of the republic may still be seen in former subject cities, such as Padua, Verona, and Vicenza, where Venetian Gothic

The lion of San Marco   palaces line the streets and the symbol of Venice, the lion of San Marco, stands over the city squares.

Today the administrative city, or *comune*, of Venice embraces the 90-mile perimeter of the lagoon, including the mainland urban and industrial complex of Mestre and

Marghera and the Marco Polo International Airport at Tessera.

Lagoon and tides.   Originally formed by the interaction of Adriatic tidal currents and the waters of several Alpine rivers (Piave, Sile, Bacchiglione, and Brenta), the lagoon has always been crucial to the survival of Venice. Its mudbanks, shallows, and channels are a source of income from marine and bird life and from salt pans. The lagoon has served as protection (the Venetians defeated the Genoese in 1380 through their superior knowledge of the navigable channels) and as a natural sewerage system, with the tides flushing out the city's canals twice daily.

But the lagoon requires careful husbandry to prevent it from threatening the very existence of Venice. When high tides combine with storm winds from the south and east, the waters in the lagoon rise and flood the city. The deep-   Flooding ening of channels in the 20th century, the overextraction of fresh water from mainland aquifers, the rising of the Adriatic Sea, and the geologic sinking of the Po River basin have all combined to lower the land level, adding to Venice's flooding problem. On a regular basis, when high tides combine with winds from the south and east, the waters of the lagoon rise and flood the city, creating the *acqua alta* ("high water") so familiar to Venetians, where elaborate raised platforms are laid out in main squares to allow tourists and others to walk around the city. A particularly severe inundation struck the city in 1966, prompting a series of national and even international efforts to study the problem and propose solutions. A scheme to build a mechanical barrage that could be raised in times of flooding to close the lagoon was initiated in 1988. However, progress has been hampered by overlapping local, regional, and national bureaucratic concerns, as well as worries

Venice and (inset) its metropolitan area.

over the effects of ambitious engineering schemes on the ecological balance of the lagoon. Such concurrent jurisdictions and conflicts of interest have produced administrative stalemate, and as a result of this inaction Venice is still vulnerable to floods and could even see a repetition of the disaster of 1966.

Climate. Most visitors experience Venice in summer, when average daytime temperatures are about 75° to 80° F (about 24° to 27° C), and a haze caused by high humidity frequently obscuring the view of the Alps across the lagoon. Spring and autumn bring clear, bright light, especially when winds are northerly, giving relief from mosquitoes and the exhausting heat of the southerly sirocco. In January the mean average temperature is 36° F (2.2° C), and wintertime Venice is dulled and chilled by mists, lending the city an especially mysterious appearance. Annual rainfall averages 33.6 inches (854 millimetres), of which more than 7 inches (185 millimetres) falls in October and November and about 6.5 inches (168 millimetres) in May and June.

Layout. Settlement in the lagoon predates Roman times, but the present urban structure took shape in the early 7th century when migrants from the mainland swelled existing fishing communities on the higher mud flats and sandbanks. Among these early settlements Rivo Alto, its name corrupted over time to Rialto, was the most central and became the heart of Venice, linking together 118 separate islands with bridges and canals and subordinating all other settlements to the rule of its elected doge (duke). In all these

lagoonal settlements the characteristic plan, still detectable in the street patterns, was dominated by a navigable channel from which side channels branched at intervals.

More than 200 original channels have been linked together to form a dense urban network on either side of the curving Grand Canal, which describes a great backward S more than two miles long, from the railway station to San Marco Basin in front of the Doges' Palace. Its width varies from about 100 to 225 feet (30 to 70 metres), and it is lined by buildings that once were the palaces of great merchant families and the public warehouses, or *fondaci*, used in foreign trade.

The Grand Canal

The original pattern of separate islands surrounding the Rialto is evident in the parishes of Venice. In many respects they remain distinct communities, with life centred on the square, or *campo* (site of the community well), and its parish church. Perhaps the most clearly recognizable such area today is the Ghetto, the islet on which from 1516 to 1797 Venice's Jews were confined. The Ghetto is located in the northwestern part of the city and is surrounded by canals whose bridges were once raised and guarded at night. Because this was the only area in which Jews could live in Venice, houses are densely packed and rise to seven stories; alleyways are almost too narrow for two people to pass.

Many parishes had their own minor guild or fraternity, and at festivals their representatives competed with one another to provide floats or oarsmen, a ritualized rivalry encouraged by the ruling patricians to promote civic stability. Over time the patchwork of local streets, canals, and quays

has been modified to improve the overall structure of the city. Quayside paths have been widened to form canalside walkways, or *fondamente,* canals have been filled in (*rio terà*), and streets have been joined by passages under the houses. (For the visitor, trying to find an address in Venice is not made any easier by the practice of numbering houses consecutively through a whole district rather than along each street.)

Gondolas

Canal boats and bridges. The best-known form of transport on the waterways of Venice is the gondola. Today there are fewer than 400 of these unique, keelless boats left, and they have long been outnumbered by other vessels. But their elegant, sleek shape and gleaming black paintwork have made them a symbol of Venice. Many writers have described the romance of Venice by gondola, and many tourists are still willing to pay high prices to be rowed at twilight through the canals to the singing of a gondolier. But it is many years since gondoliers could recite verses from such Italian poets as Ariosto or Tasso while maneuvering their amazingly flexible craft around the sharp bends of the minor canals. A number of gondolas still serve as ferries across the Grand Canal, but the cost of maintenance makes their ultimate disappearance likely.

The canals are filled with a variety of motor-powered boats. They range from the *vaporetti,* public water buses run by the municipal transport system, to the private motor-launch taxis. Other specialized craft, such as the barges carrying fruits and vegetables, the garbage barges, ambulance and police launches, and the boats filled with tourists' baggage, make up a water scene of endless colour and variety.

Venice is a walking city. Other than at the great parking lots at Rome Square and on the Lido, automobiles are banned from the city. At the risk of encountering frequent detours and dead ends, one can reach any point in Venice by foot; along the banks of the canals, on the paved streets, through the neighbourhood squares, and over the 400 or so canal bridges (*ponti*). Many of the traditional arched marble bridges remain, but large numbers of old bridges were replaced by wrought iron structures in the 19th century.

The Grand Canal is spanned by three bridges. At its most dramatic bend is the famous Rialto Bridge, designed by the aptly named Antonio da Ponte (c. 1590). The other two bridges are of more recent origin: the Scalzi Bridge, at the railway station, was built of marble in 1932, and the Accademia Bridge, a high-arched wooden structure with a temporary look, also was built in the 1930s and has withstood foot traffic by being reinforced with steel.

Palaces. The houses (*case,* or, in Venetian, *ca'*) that line the streets and canals of the city range from the poorest blocks to the great palaces (*palazzi*). Ordinary houses generally rise three or four stories. They originally had external staircases and are grouped around a communal courtyard and well. Their simple rectangular doorways and window lights may be framed in unpolished marble; otherwise they are unornamented, their red brick or ochre-painted stucco walls giving a comfortable warmth to the townscape. But it is the palaces, not the ordinary dwellings, that front directly onto the larger canals, particularly the Grand Canal, with gaudily painted mooring posts marking their water entrances.

The facades of the palaces evolved stylistically from their original Byzantine form, characterized by tall, narrow arches—those of the early Gothic period (13th to early 14th century) pointed and Moorish-looking and those of the 15th century adorned with fantastic trefoil and quatrefoil tracery. In the most ornate late Gothic palaces, such as the Ca' d'Oro (1425–c. 1440), the central panel extends across the whole facade and is repeated on two upper stories. In the late 15th century, Renaissance forms began to influence palace architecture, as in the Palazzo Corner, also called Ca' Grande (c. 1533–c. 1545, designed by Jacopo Sansovino), and the Palazzo Grimani (c. 1556, by Michele Sanmicheli, completed 1575). Buildings such as these introduced a measured proportion, tight symmetry, and classical vocabulary to the facade. Mannerist and Baroque palaces built in the 17th century present a decorated classical style with heavy moldings and grotesques, as in the Palazzo Pesaro (1659–1710, by Baldassare Longhena). The variety of styles along the larger canals, unified by the chiaroscuro of deep-set windows, decorative paneling, and building materials, provides much of the visual excitement of the Venetian landscape.

ECONOMY

Legacy of maritime commerce. The landscape of Venice is as much a product of its economic activities, past and present, as of its physical environment. The enduring foundation of Venetian wealth was maritime commerce, initially in local products such as fish and salt from the lagoon, but rapidly expanding to include rich stores of merchandise as Venice became the entrepôt between Europe and the Middle East and Asia. The Rialto remains the core of   The Rialto Venetian commercial and mercantile activity. Fruit, fish, and other markets are concentrated under the open arcades of the Rialto New Building (1554, by Sansovino) and associated buildings. The Rialto Bridge and surrounding streets remain crowded with market stalls. Along the Merceria, the route from the Rialto Bridge to the Piazza San Marco (St. Mark's Square), are the offices of the major banks, still in the traditional banking quarter.

Venetian trade required well-constructed vessels both for transport and for protection from pirates, rivals, and Turkish military forces. Shipbuilding inevitably became a major industry. It occupied a whole sector in the northeast of the city, the Arsenal—a vast assemblage of basins, yards, and workshops for making sails, ropes, and ordnance. At its entrance is an elaborately decorated gateway with a fine group of stone lions guarding what was until the 18th century Europe's largest industrial complex. Parts of the Arsenal are still used for Italian military purposes, though other parts have been converted into beautiful spaces for art and architecture exhibitions or for theatrical productions.

The port of Venice. The main port and related activities have now shifted to the parish of Mendigola in the west. Here the main cruise liners dock, and the offices of shipping lines occupy former palaces. But the real focus of commercial shipping today is Port Marghera, developed next to the suburb of Mestre on the mainland shore west of Venice. Marco Polo International Airport (1960) was built on reclaimed land at Tessera, to the northwest of the city. Although they are incorporated into the city administration, the chief port activities are now largely separate from Venice proper. Their impact on the old city, however, is considerable. Marghera was for 50 years the site of a huge oil-refining and petrochemical complex, easily visible from Venice and a source of air pollution that severely damaged its architecture. Although industrial activity at Marghera has declined, the long-term damage of pollution is still felt.

Traditional industries. Scattered throughout the urban area are small boatyards and other traditional luxury craft workshops producing lace, textiles, and furniture. One of Venice's oldest specialties is glassworking. The finest   Glass-products are of exquisite quality, but most of the present-   working day glass goods are trinkets for the tourist trade. In 1291 many of the glassworking furnaces were relocated on the island of Murano to the north as a precaution against fire, and Murano remains the focus of present-day glass production, though the industry has declined considerably. Exhaust fumes from this ancient industry also contribute to the corrosion of Venice's stonework.

Other small island settlements such as Burano, Caorle, Malamocco, and Torcello traditionally depended on the local economic activities of the lagoon: fishing and fowling, salt production, and horticulture. Some settlements are swamped by seaside tourist developments, but the ancient trades are still carried on, though they are in fast decline. Fishermen in small craft continue to be common sights in the lagoon.

Tourism. Since the end of the 18th century, tourism has been at the heart of the Venetian economy. Luxury establishments such as the Danieli hotel and the celebrated Caffè Florian were developed in the 19th century for wealthy foreigners. Small hotels and shops line each major street and square along the routes from the station and parking lots to the Rialto and San Marco. Nearly a third of the city's workers find employment in tourism and its related industries, now continuous through all seasons.

The tourist industry has been actively encouraged by the authorities. In the early 1980s they revived the ancient Carnival during February, a complement to the round of events like the Biennale (an international art festival held in even years) and international festivals of film, drama, and contemporary music. These, together with the promotion of Venice as an international conference centre, bind the city's economy ever more firmly to tourism.

Mass tourism, however, has also created problems for the city. The infrastructure is often close to collapse under the weight of literally millions of visitors every year, and residents have to deal with extremely high prices dictated by the tourist industry. Indeed, Venice may be transforming itself into a protected "museum-city" with very little in the way of real urban communities or a cultural life apart from that designed for outsiders.

CULTURAL HERITAGE: THE MYTH OF VENICE

Reacting to their physical environment and to a variety of cultural influences—from Italy, northern Europe, and the East—the Venetians consciously designed their city as an exceptional place. They regarded it as a divinely ordained centre of religious, civic, and commercial life, a community blessed by St. Mark, protected by its lagoon, and governed by a balanced constitution incorporating monarchy, aristocracy, and republican liberty. Historians refer to this perception as the "myth of Venice." The architecture of the city, especially in the Renaissance, purposely emulated republican Rome, and the great rituals of state—the doge's procession from his palace to the basilica or the annual Marriage with the Sea, when the doge cast a gold ring into the lagoon as a "sign of true and perpetual dominion"—publicly expressed the myth.

San Marco. The administrative heart of the Venetian republic was at San Marco in the buildings surrounding Piazza San Marco and the Piazzetta ("Little Square"). This spectacular piece of town planning depends for its impact on the articulation of paved open spaces, monumental buildings, carefully situated monuments, and the reflective waters of the lagoon basin.

The Doges' Palace. The core of political life in Venice was the Doges' Palace (Palazzo Ducale), whose crenellated mass appears to float upon the waters of the lagoon. Its plan, typical of Venetian palaces, is centred on an internal courtyard with a great staircase (Scala dei Giganti), and it incorporates three great architectural traditions—Gothic, Moorish, and Renaissance. Erected over many years after the burning of the original 9th-century structure in 976, most of the present building dates from the 14th to the 16th century. The palace was not only the residence of the elected doge but also the meeting place of the republic's governing councils and ministries. Its chambers and staircases were richly decorated by a succession of Venetian painters and craftsmen. On the east side of the palace runs a narrow canal spanned by the Bridge of Sighs, which led to the state prisons and is immortalized in Lord Byron's *Childe Harold.*

The Molo. At the entrance to the Piazzetta was the cere-

monial landing spot for great officials and distinguished visitors. This "front door" to Venice, the Molo, is marked by two massive granite columns brought from the Orient in the 12th century; one supports the winged lion of St. Mark supporting a book and the other St. Theodore, Venice's first patron, standing on a crocodile.

San Marco Basilica. Sculptured lions are to be found at many points within the square and on its buildings. The key to Venetian political iconography, they symbolize the evangelist St. Mark, whose body was said to be buried in San Marco Basilica, attached to the Doges' Palace. This splendid church, begun in 829 and completed in about 1071, was traditionally the private chapel of the doges and effectively a political building. Its architectural design is Byzantine, with five vaulted domes set in a Greek cross. The interior glows with light reflected from its undulating marbled pavements, its columns and polished stone panels, and its golden mosaics.

Piazza San Marco. Before the five arched portals of the basilica lies the Piazza San Marco, a vast paved and arcaded square. Napoleon called it the finest drawing room in Europe. The northern and southern wings of the square are formed by two official buildings, the Old Procurators' Offices and the New Procurators' Offices. The buildings now house fashionable shops and elegant cafés, whose string ensembles compete with each other in summer months to attract customers to their open-air tables. At the basilica end of the Old Procurators' building stands the Clock Tower, a late 14th-century structure where the hours are struck by two Moorish figures.

Tourists throng the square at all hours, outnumbered only by gluttonous pigeons. The Clock Tower rises over the entrance to the Merceria, the main shopping street leading to the Rialto, and stands in a direct line of sight to the columns at the end of the Piazzetta. This sightline is emphasized by three flagpoles fronting the basilica and by Sansovino's Loggetta ("Small Loggia," or "Small Gallery"), at the base of the Campanile, where council members met. The Campanile, the massive 324-foot (99-metre) bell tower of St. Mark's, dominates the townscape, visible for miles across the lagoon. In 1902 it collapsed, making a fortune for the photographer who captured the event. The city council decided immediately to rebuild it around a core of reinforced concrete, and the work was completed in 1912.

The Campanile stands close to the 21 bays of the Old Library (1529, also called the Library of St. Mark's or the National Marcian Library), on the western side of the Piazzetta. The library was designed by Sansovino to house a great collection of humanist texts and manuscripts bequeathed in 1468 to the republic. Now a major research library, it numbers among its treasures Marco Polo's will, a manuscript in Petrarch's hand, and many books and maps printed when Venice was a great publishing and cartographic centre.

Trade-guild buildings. The oligarchic form of government during the republic excluded from power all non-noble Venetian families. There were, however, other ways

Venice, looking toward the Molo and the Piazzetta, with (left of the Piazzetta) the Old Library and the Campanile and (right of the Piazzetta) the Doges' Palace. The domes of San Marco Basilica appear behind the Doges' Palace.

Historic rituals

The Molo

The Campanile

in which ordinary Venetians could participate in public life. One of these was through the *scuole*, six major and numerous minor philanthropic confraternities and guilds that originated in the 13th century. Each school had a two-story meeting hall used for gatherings of its members and for discharging its charitable functions. The six great schools became enormously wealthy, enriching their buildings with splendid architectural decoration, as at the Great School of San Marco (founded *c.* 1260, rebuilt after a fire 1487–95; now a hospital), with its trompe l'oeil marble panels. The painted panels and ceilings of the Great School of San Rocco (instituted 1478, completed 1560) are masterpieces by Tintoretto. The School of San Giorgio degli Schiavoni (for Slavic merchants) has the finest collection of Vittore Carpaccio's works outside Venice's chief gallery, the Academy of Fine Arts, whose own collection came in part from a confraternity of flagellants, the school of San Giovanni Evangelista (founded 1261).

Churches. The San Marco Basilica was the focus of public religious life, but the scores of other Venetian churches are an essential element of the city's landscape. Their campaniles, rarely perpendicular, punctuate the skyline; their ornate facades grace the squares, from the delicate Gothic of Madonna dell' Orto (*c.* 1350, rebuilt in the early 15th century) and the restrained elegance of the early Renaissance at Santa Maria dei Miracoli (1481–89) to the Baroque flamboyance of San Moisè (1668).

The most impressive churches are those of the medieval mendicant orders, the Dominicans and Franciscans. The Dominican church of Santi Giovanni e Paolo (San Zanipolo in the Venetian dialect; founded in 1246 and consecrated in 1430), of rose-coloured stone, its vast interior designed for the large congregations of urban poor whom it served. As a burial place, it was favoured by noble families; a number of doges lie there, commemorated by richly wrought sepulchral monuments. The church's altarpieces, painted by Titian and Giovanni Bellini, were partially destroyed in a fire in 1867, and for masterworks it can no longer rival the Franciscan Santa Maria dei Frari (founded *c.* 1250, completed *c.* 1443), whose enormous Gothic mass rises in the densely settled area west of the Rialto. Titian's "Assumption" (1516–18) stands over its high altar, and the church and sacristy display a magnificent collection of Venetian religious paintings from the High Renaissance.

In contrast to these great Gothic churches, and indeed to Palladian churches the small parish churches enmeshed in the urban fabric, are the church of La Salute and the Palladian churches seen across the water from San Marco. All serve a monumental as much as a religious function. Santa Maria della Salute (begun in 1631/32, Longhena, and consecrated in 1687), erected in thanksgiving for release from plague, occupies a spectacular site where the Grand Canal opens into the San Marco Basin. Its mass of brilliant white marble rises majestically above the Gothic palaces of the Grand Canal. The churches of San Giorgio Maggiore (1566, completed in 1610), Il Redentore (1577–92), and Le Zitelle (1582–86) were all designed by Andrea Palladio; their Roman classical facades were intended to be seen across the waters of the Giudecca Canal. San Giorgio and La Salute turn the open lagoon in front of San Marco into an aquatic extension of the Piazza. Il Redentore is linked to Venice proper by a temporary bridge every July on the Feast of the Redeemer, when illuminated boats fill the Giudecca Canal and there is a display of fireworks.

Painting. Just as the city's architecture reflects notions of Venice as a place for public ritual, so, too, Venetian painting evokes the "myth of Venice." From the late 15th-century townscape paintings by Carpaccio and Gentile Bellini to the High Renaissance Madonnas and saints in landscapes by Giovanni Bellini, Giorgione, and Titian, the Mannerist canvases of Paolo Veronese and Tintoretto, and the rich early 18th-century townscapes of Canaletto, G.B. Piazzetta, and Francesco Guardi, Venetian painting returned constantly to themes celebrating the city, its great families, its legends, its saints, and its victories. Venetian art was more often than not political art; like all cultural life in Venice, it was subordinated to the interests of the state.

Music. Colour and splendour reflecting civic pride are evident, too, in Venetian music. The works written for several separate choirs by Giovanni Gabrieli and Claudio Monteverdi for San Marco echoed around its Byzantine interior with stirring effect. Venice's opera house, La Fenice La Fenice Theatre, built in 1792, became a major Italian music centre. The structure was severely damaged by fire in 1996. The premieres of Gioacchino Rossini's *Tancredi* (1813) and Guiseppe Verdi's *Rigoletto* (1851) and *La Traviata* (1853) at La Fenice were witnessed by their composers. Many foreign composers also developed a special attachment to the city.

Motion pictures. Venice has had a strong attachment to the cinema since 1937, when fascist leader Benito Mussolini set up the International Venice Film Festival, to be held annually in the Palazzo del Cinema on the Lido. Motion-picture directors have often used Venice as a ready-made set for their films, from Luchino Visconti (*Senso,* 1954; *Morte a Venezia [Death in Venice],* 1971) to Nicolas Roeg (*Don't Look Now,* 1973) to Woody Allen (*Everyone Says I Love You,* 1996).

CONTEMPORARY LIFE

For Venice, adaptation to the demands of the modern world is often a painful process. While the era of vast refining and petrochemical development along the lagoon shore may be over, its damage to Venice in visual and environmental terms has been immense. After the disastrous floods of 1966, the United Nations Educational, Scientific and Cultural Organization (UNESCO) began to coordinate an international effort to preserve the city. A number of national committees, too, now exist to save Venice and its art treasures from the combined effects of corrosive air pollution, rising damp, flooding in high-water periods, sheer age, and even defacement by pigeons. The completion of an aqueduct from the nearby Alps to Marghera has prevented further aquifer exhaustion, and the effects of international funding are increasingly visible in renovated buildings and monuments.

Venice still sustains a distinct urban life. Away from the main tourist routes, children use the squares as playing fields, a poor substitute for the chronic shortage of parks, playgrounds, and modern school amenities. The university at Ca' Foscari, a modern foundation, has highly reputable schools of architecture and planning. The renovated State Archives is an international centre of scholarship, its documentary collections covering a thousand years of the Venetian republic. It is complemented by other scholarly centres such as the Old Library, the Correr Civic Museum, and the Cini Foundation.

Although planning regulations severely restrict alterations to buildings, there are examples of modern additions and structures. The fire station of Foscari Canal makes use of the traditional architectural vocabulary; other buildings, such as the headquarters of the Venetian Savings Bank in the Campo Manin, are uncompromisingly modern.

A growing problem for Venice today is the loss of population from the city core. Of some 340,000 residents, fewer Population loss than 100,000 still live in the historic centre. Faced with poor social amenities and old, decaying, often damp buildings with rents inflated by the costs of renovation, demands of the tourist industry, and wealthy foreign residents, Venetians have elected in ever-increasing numbers to move into modern apartments in the mainland boroughs of Mestre and Marghera or on the Lido. This exodus has produced a daily commuting problem and left the city of Venice with a smaller resident population than many of its formerly subject towns. It threatens to turn Venice into a museum city—a glorious spectacle whose architectural and artistic heritage is preserved, as it should be, but whose daily life is almost a parody of the vital unity of commerce, piety, politics, and ritual that was the pride of *la serenissima.* (D.E.C./J.Ft.)

History

THE EARLY PERIOD

Origin of the city. Uniquely among Italy's chief cities, Venice came into being after the fall of the Roman Empire in the West. The Lombard hordes, whose incursions into northern Italy began in AD 568, drove great numbers of

mainlanders onto the islands of the lagoon, previously the homes of itinerant fishermen and salt workers. The isolated communities, literally islands of Veneto-Byzantine civilization, became part of the Exarchate of Ravenna when it was created in 584. When the mainland Byzantine city of Oderzo fell to the Lombards in 641, political authority was shifted to one of the islands in the Venetian lagoon.

The first elected doge, or duke, was Orso, chosen in an anti-Byzantine military declaration in 727, but he was succeeded by Byzantine officials until about 751, when the Exarchate of Ravenna came to an end. There followed decades of internal political strife among various settlements vying for supremacy and between pro- and anti-Byzantine factions; also involved were attempts by church authorities to acquire temporal influence. Finally the doge Obelerio and his brother Beato formed an alliance with the Franks of Italy and placed Venice under the authority of the Italian king Pepin (died 810), in order to free themselves from Byzantine control.

Political independence

Pro-Byzantine reaction to this event under the doges of the Particiaco family led to the transfer of the seat of government to the Rialto group of islands, by then the centre for exiles in the factional fighting. Though a Franco-Byzantine treaty of 814 guaranteed to Venice political and juridical independence from the rule of the Western Empire, it did not confirm any effective dependence on the Byzantine Empire, and by 840–841 the doge was negotiating international agreements in his own name. The unusual legal and political position of the small independent duchy, situated in territorial isolation between two great empires, contributed greatly to its function as a trading intermediary.

A long succession of serious disputes between leading families concerning the office of doge did not halt the rapid development of trade. Increase in private wealth led to the gradual achievement of internal stability by creating a broader ruling class that was capable of putting a limit to the power of the doge. Gradually a national consciousness developed. Beginning in the late 9th century, the doges were chosen by popular election, though the right was frequently abused during times of civil strife. Finally the group of Rialto islands was solemnly transformed into the city of Venice (*civitas Venetiarum*).

The new order. The final collapse of family faction rule led to a change in the system of government, inaugurated by Doge Domenico Flabanico (1032–42). He restored to the people the sovereign right to elect the doge, but the term *populus* was in practice restricted to the residents of the Rialto and, more narrowly, to a select group of nobles. The executive organ was the ducal curia, and the legislative assembly was summoned to approve the doge's acts. A new church was built for St. Mark, symbol of the Venetian spirit, under Doge Domenico Contarini (1043–70), an energetic defender of the religious independence of the duchy.

GROWTH OF TRADE AND POWER

In the conflict between papacy and empire, Contarini and his successors remained neutral (despite the complaints of Pope Gregory VII), while safeguarding Venetian economic interests in the Adriatic when the conflict began to be reflected on the Dalmatian coast. But the greatest danger to Venetian interests was the 11th-century Norman expansion under Robert Guiscard, which threatened to cut Venetian communications to the south. The successful action taken against the Normans by Doge Domenico Selvo and his successor Vitale Falier helped to assure Venetian freedom on the Mediterranean Sea.

Relations with the Byzantine Empire. In gratitude for Venetian aid against the Normans, the Byzantine emperor Alexius I Comnenus granted Venice unrestricted trade throughout the Byzantine Empire, with no customs dues, a privilege that marked the beginning of Venetian activity in the East (1082). The Adriatic was not yet secured, however; Dalmatian ports were threatened by the Hungarians and Slavs, with whom it was difficult to come to agreement.

Toward the end of the 11th century the Crusades focused the newly awakened trading interests of the West on the Mediterranean. At first Venice was chiefly concerned with gaining control of the European trading ports of the Byzantine Empire, leaving to private interests the commercial opportunities in Syria and Asia Minor. Although they had been the first to win trade concessions and a commercial quarter in Constantinople, the Venetians antagonized the Byzantines by their arrogance and lawlessness as well as by their superior enterprise. In helping the emperor Manuel I Comnenus drive the Normans out of Corfu (1147–49), they offended him by their aggressive behaviour.

Soon the mutual dislike between Venetians and Byzantines ripened into hatred. The emperor encouraged merchants from the Italian republics of Genoa and Pisa to compete in Byzantine markets, and the Venetians responded by destroying the establishments of their rivals. In 1171, to maintain order in his dominions, the emperor arrested all Venetian residents in Constantinople and the provinces and confiscated their goods. Relations were patched up in 1187 and again in 1198, but the Venetians remained embittered.

Enmity of the emperor

The commune. All this time the expansion of Venice along the borders of the lagoon and across the Adriatic on the Dalmatian coast not only enriched its patrimony but also created an awareness of its own political power. Between 1140 and 1160, in the response to the needs of its increased territory and growing economy, Venice underwent a revolutionary change in its political structure, reorganizing itself as a republic. The doge lost his monarchic character, becoming a mere official (though he still assumed resounding titles), and a commune took over the powers, functions, and prerogatives of the state. All political and administrative matters were placed in the hands of the Great Council of 45. A Minor Council of six members exercised executive powers alongside the doge, and magistrates were granted administrative and judicial functions.

Trade conflicts. Venetian bitterness against the Byzantines found an outlet in the Fourth Crusade, which captured and sacked Constantinople in 1204 with the doge Enrico Dandolo among its leaders. In the subsequent partition of Byzantine territory between Venetians and crusaders, Venice acquired a commercial empire in the eastern Mediterranean. It included many of the Aegean islands, most importantly Crete and parts of Euboea, with valuable trading stations and fortified lookout posts on the Greek mainland. The doges adopted the title of Lord of One-Quarter and One-Eighth of the Entire Byzantine Empire (*Quartae Partis et Dimidiae Totius Imperii Romaniae Dominator*). A special magistrate, appointed from Venice, administered the substantial Venetian colony in Constantinople.

In 1261 the Byzantine emperor in exile at Nicaea, with the support of the Genoese, recovered the city and evicted the Venetians. The emperor rewarded the Genoese with privileges that challenged the Venetian monopoly of trade and opened up to Genoa the Black Sea markets. The Venetians retained control of many of the Greek islands, however, and gradually found their way back to partial favour in Byzantium through a series of treaties. But when the last of the crusader strongholds in Syria fell to the Muslims in 1291, Venetian merchants who had been dispossessed moved north to dispute the Black Sea trade with the Genoese. For nearly two centuries thereafter, Venice and Genoa were periodically at war.

The patriciate. Meanwhile, at home the Venetian state was being built up. In 1242 the civil statutes of Jacopo Tiepolo regulated civil and economic relations; maritime statutes had been established in 1239. The number of elected members of the Great Council was raised from 45 to 60 and then to 100. The council of 40 (first mentioned in 1223) received powers of jurisdiction, and the Consiglio dei Rogati (60 members; founded mid-13th century), invested with the control of economic affairs, in time assumed all legislative functions and the honorific title of Senate.

Between 1290 and 1300, new laws restricted the right to take part in the government to families traditionally performing magistrate's duties. The patrician class was not created by the "closing of the Great Council" (*serrata del Maggior Consiglio*) achieved by these laws, but it received its legal status from them. Henceforward anyone claiming personal power had to act outside the patrician order and rely on the people; and the people were linked so closely to the patricians by their economic needs that sufficient support was always lacking. Thus the conspiracy of Marin

Patricians and the people

Bocconio failed (1299), as did those of Bajamonte Tiepolo and the Querini brothers (1310) and later of Marin Falier (1354). The special character of Venetian society created a governing class very different from that of the other Italian communes or of the continental states. To counter any attempts at sole personal rule, the Council of Ten was established (1310) to police the patrician order and defend the existing regime.

Struggle for naval supremacy. By the beginning of the 14th century the republic was swept into struggles on the mainland of Italy and in the Adriatic and Mediterranean seas. When the Scaligeri came to power in Verona, the republic made alliance with the Carraresi of Padua, with the Florentines, and with the Visconti of Milan, who feared the rise of a strong territorial lordship in the heart of northern Italy. Deviating from its strictly maritime policy, Venice established sovereignty over Treviso, thereby ensuring its own food supply but also taking on the defense of a land frontier.

The antagonism and rivalry with Genoa were rekindled. The conflict, carried on mainly in Dalmatia, was made more difficult for all by the spread of the Black Death (1348), by the economic and financial crisis caused by the war itself, and by the ineptitude of the military operations. In the alternation of victories and defeats, both sides exhausted their energies and resources. At last a second anti-Venetian coalition brought the war almost into Venice itself; at Pula (Pola) and at Chioggia, Venice first was defeated and then won the victory (1380–81). The Peace of Turin (1381) eliminated Genoese political influence from the Mediterranean and the East, leaving the Venetian government as arbiter of the sea routes.

Zenith of power. The Venetian victory over Genoa took place under the threat of Turkish advance in the East. The Venetians had to negotiate a state of neutrality with the Turks and find another economic base to compensate for the smaller yield now to be expected from trade with the East. So they turned to the Italian mainland, first to rid themselves of neighbouring lordships and then to defend and exploit the rich lands they had acquired. For a time Venetian territorial rule went no further than the Mincio and Livenza rivers, but beyond the Livenza lay the politically and economically important principality of the patriarch of Aquileia, through which passed the main routes to Germany and to Istria. Because the patriarch could not guarantee peace and order, Venice incorporated the principality in the Venetian domains (1420).

Venetian territory now covered roughly the areas of the modern regions of Veneto and Friuli-Venezia Giulia, together with the Istrian Peninsula. The doge Tommaso Mocenigo maintained that his city had reached its political and economic zenith; it had a solid base in Italy that could compensate for its losses in the East, and it should not expect indefinite progress. In fact, efforts to enlarge its conquests might be dangerous, and it was better to preserve, not to risk, its accumulated wealth. Mocenigo's successors, however, did not heed his warning.

POLITICAL AND ECONOMIC DECLINE

When he became Venice's doge in 1423, Francesco Foscari embarked upon a series of wars in mainland Italy, particularly against Milan. Greed for conquering new territory involved the Venetians in a tangled web of Italian balance-of-power politics and in conflicts between the great powers of Europe on a scale out of proportion to Venetian forces and direct interests. The Peace of Lodi (1454) was followed by the formation of the Italian League to restore political balance among the Italian states, but the accord was ephemeral and Italy was threatened with foreign intervention.

Meanwhile, the Turks were encroaching upon the Byzantine Empire in the East; Thessalonica fell in 1430 and Constantinople in 1453. Further Turkish moves prompted Venice to defend its eastern territories, but in 1470 Euboea fell into Turkish hands. Peace with the Turks was finally achieved in 1479. The Venetians, however, soon became involved in another war, this time with Ferrara. Venice's conquest of the Polesine region (1484) increased the opposition of the other Italian states to Venetian territorial expansion.

Europeans and Turks against Venice. This internal discord made Italy a prey to invading foreigners, Spanish, French, and German. By 1508 these powers, together with the pope, the Hungarians, the Savoyards, and the Ferrarese, united to form the League of Cambrai against the Venetians, who were defeated at the Battle of Agnadello. Venice was saved from the worst results of this event by internal discords within the League of Cambrai, but Venetian territories on the mainland were diminished. At the same time, the republic was experiencing an economic crisis. Not only was the Eastern market lost but the discovery of new lands in the West and new trade routes to the East released Europe from dependence on Venetian merchants. Venice ceased to be a Mediterranean power, and, as a European power, it lacked the advantage that the Atlantic countries had of direct access to the New World.

Venetian policy in the 16th century was dictated by the need to keep intact its political, economic, and territorial heritage against the advance of the Turks on the one side and the pressure of the great western European powers on the other. This need supplied the reason for Venice's intervention in the Italian crisis of the emperor Charles V; for its struggle against the Turks, from the defeat of Préveza in 1538 to the victory of Lepanto and the loss of Cyprus in 1571; and for its tenacious resistance to pressure from the pope. So Venice declined into economic stagnation, embittered by a constitutional conflict between the Consiglio dei Rogati and the Council of Ten for control of the public finances. Venetian peace and neutrality meant defending the immediate interests of the nation but ceasing to take part in problems in which it was not directly concerned. Thus the spirit of political and religious conservatism grew increasingly tenacious in Venice.

After a long campaign (1645–69) Crete, Venice's last possession in the eastern Mediterranean, fell to the Turks—the Venetians being allowed to retain only a few strongholds. This blow to morale was mitigated, however, by the preservation of Dalmatia, and the government, after allying itself with Austria, attempted to reestablish itself in the eastern Mediterranean by liberating the Morea (Peloponnese) from the Turks. There the brilliant campaign of Francesco Morosini in 1684–88 assured Venice of this new Greek territory, which was finally handed over in 1699. But the conquest proved profitless and became an expensive burden, and in 1718 the Morea was returned to the Turks. Thus ended Venetian activity in the eastern and southern Mediterranean, save for an unsuccessful attempt in 1769 on Algerian and Tunisian pirates under Angelo Emo.

End of the Venetian republic. During its later years the Venetian republic was estranged from the fervour of new ideas germinating in other nations. Venetian life had crystallized inescapably. The plans of Angelo Querini, Giorgio Pisani, and Carlo Contarini, who in the 18th century called themselves reformers, did not go beyond those of the noble class that for three centuries had controlled the government and that existed to uphold ancestral tradition or to satisfy personal ambition.

The end of the republic came after the outbreak of the French Revolution. Napoleon, determined to destroy the Venetian oligarchy, claimed as a pretext that Venice was hostile to him and a menace to his line of retreat during his Austrian campaign of 1797. The Peace of Leoben left Venice without an ally, and Ludovico Manin, the last doge, was deposed on May 12, 1797. A provisional democratic municipality was set up in place of the republican government, but later in the same year Venice was handed over to Austria.

In 1848 the revolutionary leader Daniele Manin set up a provisional republican government, but it fell the following year. After the defeat of Austria by the Prussians in 1866, Venice was ceded to Italy, which had been a united kingdom since 1861.

IN UNIFIED ITALY

The subsequent growth of Venice was attendant upon its role in the commercial life of Italy and upon exploitation of its inherent physical and aesthetic attributes. The city had lost a bit of its island character and some of its insular mentality in 1846, when a causeway nearly two miles (three kilometres) in length brought the railway across 222 arches from the mainland. It lost even more in 1932 when a par-

(margin notes)

Territorial acquisitions

Struggle for the Venetian heritage

allel road was built to give access to motor vehicles. Each link was stoutly resisted by persons who wished to leave the city unchanged, and they succeeded in forcing wheeled vehicles to be garaged at the landward edge of the island. Similar battles continue between traditionalists and modernists.

In the political sphere, Venice was run by leftist governments immediately after World War II and by centre-left or centrist administrations for much of the 1950s and '60s. During the upheaval of 1968, there were long occupations by students of the architecture faculty in the city as well as massive strikes by workers at Port Marghera. Later, the Socialists ran the city, but their plans for massive development were blocked by protests of possible damage to the city. In the 1990s a reformist intellectual mayor, Massimo Cacciari, attempted to modernize Venice while protecting its immense heritage, but he too was unable to secure action on such basic structural problems as population loss and high water.

The 1990s also saw Venice become a symbol of the regionalist politics of the Northern Leagues (Lega Nord), a collection of parties that advocated greater autonomy for Italy's prosperous northern regions. It was in Venice in 1996 that Umberto Bossi, leader of the Leagues, read a so-called declaration of independence of a separate "Padanian" state. Venice thus found itself the capital of the most regionalist of all elected regional governments. In general, however, the city's voters resisted extreme politics, and Venice remained an oasis of centre-left ideology within the Veneto region.

The environmental crisis In a broad sense, the entire history of Venice has been that of a struggle to control and utilize the environment, and indeed the most urgent problems confronting the present-day city are environmental. In the second half of the 20th century, the deterioration of ancient buildings and art treasures, which had long been associated with natural phenomena such as flooding and subsidence, was intensified by an atmosphere laden with sulfuric acid, much of it generated by industrial and domestic smoke. Severely damaging storms and floods in November 1966 stimulated increased efforts to rescue the historic city from environmental destruction, yet flood-control projects (big and small) have been blocked through a combination of inefficiency, corruption, and overprotection of Venice through special laws and ecological politics. Venice has always been a city of production, from the invention of mass boat and ship construction in the Arsenale to the industrialization of Port Marghera. If the campaign for preservation fails, there seems little that can be done to arrest the city's decline—unless the battle is won by those who adore this most sublime of all cities.   (R.Ce./J.Ft.)

BIBLIOGRAPHY

General. Views and descriptions of the modern city are found in many well-illustrated guides: HUGH HONOUR, *The Companion Guide to Venice,* 4th ed. (1997); GUIDO ALBERTO ROSSI and FRANCO MASIERO, *Venice from the Air* (1988); OLIVIER BERNIER and FULVIO ROITER, *Venice II* (1985); and ALTA MACADAM, *Venice,* 6th ed. (1998), in the *Blue Guide* series. Life in Venice is surveyed in SHIRLEY GUITON, *A World by Itself: Tradition and Change in the Venetian Lagoon* (1977); JAN MORRIS, *Venice,* 3rd rev. ed. (1993); ALESSANDRO SAVELLA and NANTAS SALVALAGGIO, *The Carnival of Venice,* (1984; originally published in Italian, 1984); GEORGE BULL, *Venice: The Most Triumphant City* (1980, reissued 1982); and CHRISTOPHER HIBBERT, *Venice: The Biography of a City* (1988, reissued 1997).

Observations and reflections on Venice can also be found in a number of works by literary individuals who lived or traveled in Venice. These include chapters of GIACOMO CASANOVA, *History of My Life,* 12 vol. in 6 (1966–71, reissued 1997; trans. from French 1960–62 ed.; originally published in 1826–38), by the notorious Venetian adventurer; CHARLES DICKENS, *Pictures from Italy* (1846), written by the Victorian novelist following a European tour, available in many later editions; JOHN RUSKIN, *The Stones of Venice,* 3 vol. (1851–53; reprinted 1979), a major study of the course of history as reflected in architecture, also available in abridged versions; W.D. HOWELLS, *Venetian Life,* rev. and enlarged ed. (1907), written by the American novelist after his posting as U.S. consul to Venice in 1860–65; HENRY JAMES, *Italian Hours* (1909, reprinted 1987), by the great transatlantic novelist

who set many of his stories in Italy; and MARY MCCARTHY, *Venice Observed* (1956, reissued 1963), an illustrated travelogue by the American novelist and critic.

History. A history of the Venetian republic is available in JOHN MARTIN and DENNIS ROMANO (eds.), *Venice Reconsidered: The History and Civilization of an Italian City-State, 1297–1797* (2000). Recent Italian historiography includes two works, *Storia della Cultura Veneta,* 6 vol. in 10 (1976–86), and *Storia di Venezia* (1992–), published by the Istituto della Enciclopedia Italiana. Also useful are ROBERTO CESSI, *Storia della repubblica di Venezia,* 2 vol. (1944–46, reissued in 1 vol., 1981), a history by Venice's foremost historian; and WILLIAM H. MCNEILL, *Venice: The Hinge of Europe, 1081–1797* (1974, reprinted 1986). Other historical studies include GUIDO RUGGIERO, *Violence in Early Renaissance Venice* (1980); ALBERTO TENENTI, *Piracy and the Decline of Venice, 1580–1615* (1967; originally published in Italian, 1961); DONALD E. QUELLER, *The Venetian Patriciate: Reality Versus Myth* (1986); DENNIS ROMANO, *Patricians and Popolani: The Social Foundations of the Venetian Renaissance State* (1987); MARGARET L. KING, *Venetian Humanism in an Age of Patrician Dominance* (1986); D.S. CHAMBERS, *The Imperial Age of Venice, 1380–1580* (1970); EDWARD MUIR, *Civic Ritual in Renaissance Venice* (1981, reissued 1986), on the role of public display in the life of the republic; M.E. MALLETT and J.R. HALE, *The Military Organization of a Renaissance State: Venice, c. 1400 to 1617* (1984), on the armed forces and power politics; ROBERT FINLAY, *Politics in Renaissance Venice* (1980), on the complex political structure that was in place at the height of the republic; and WILLIAM J. BOUWSMA, *Venice and the Defense of Republican Liberty: Renaissance Values in the Age of the Counter Reformation* (1968, reissued 1984), on the evolution and political uses of the "myth of Venice." The 1848 revolution in Venice is discussed in PAUL GINSBORG, *Daniele Manin and the Venetian Revolution of 1848–49* (1978).

Histories of the economic and social conditions and commerce include FREDERIC C. LANE, *Venice: A Maritime Republic* (1973); FREDERIC C. LANE and REINHOLD C. MUELLER, *Money and Banking in Medieval and Renaissance Venice: Coins and Moneys of Account* (1985); PETER LAURITZEN, *Venice: A Thousand Years of Culture and Civilization* (1978, reissued 1981); and a collection of earlier works by FREDERIC C. LANE, *Studies in Venetian Social and Economic History,* ed. by BENJAMIN G. KOHL and REINHOLD C. MUELLER (1987). Also of interest are JAMES C. DAVIS, *A Venetian Family and Its Fortune, 1500–1900: The Dona and the Conservation of Their Wealth* (1975); SUSAN CONNELL, *The Employment of Sculptors and Stonemasons in Venice in the Fifteenth Century* (1988); and RICHARD J. GOY, *Chioggia and the Villages of the Venetian Lagoon: Studies in Urban History* (1985). An intelligent study of the image and future of Venice is GIANFRANCO BETTIN, *Dove volano i leoni: fine secolo a Venezia* (1991).

The role of the Jewish community and the history of the Ghetto is detailed in RICCARDO CALIMANI, *The Ghetto of Venice* (1987; originally published in Italian, 1985); BRIAN PULLAN, *The Jews of Europe and the Inquisition of Venice, 1550–1670* (1983, reissued 1997); and ROBERT C. DAVIS and BENJAMIN RAVID (eds.), *The Jews of Early Modern Venice* (2001).

Arts and architecture. DEBORAH HOWARD, *The Architectural History of Venice* (1980, reissued 1987), provides a detailed treatment of Venetian buildings and their social context. Two more recent surveys are MARION KAMINSKI, *Venice: Art & Architecture,* trans. from German (2000); and GIANDOMENICO ROMANELLI (ed.), *Venice: Art & Architecture,* 2 vol. (1997). Also useful are MICHELANGELO MURARO and PAOLO MARTON, *Venetian Villas,* 2nd rev. ed. (1999); PETER LAURITZEN and ALEXANDER ZIELCKE, *Palaces of Venice* (1978, reissued 1992); DOUGLAS LEWIS, *The Late Baroque Churches of Venice* (1979); and RICHARD J. GOY, *Venetian Vernacular Architecture: Traditional Housing in the Venetian Lagoon* (1988). PETER LAURITZEN, JORGE LEWINSKI, and MAYOTTE MAGNUS, *Venice Preserved* (1986), is a concise survey of restoration work.

Developments of the Renaissance period are studied in JOHN MCANDREW, *Venetian Architecture of the Early Renaissance* (1980); RALPH LIEBERMAN, *Renaissance Architecture in Venice, 1450–1540* (1982); and BERNHARD BERENSON, *The Venetian Painters of the Renaissance,* 3rd ed. (1897, reissued 1911). Essays on many aspects of Venetian art and politics of the Renaissance are collected in an illustrated catalog of a major exhibition, JANE MARTINEAU and CHARLES HOPE (eds.), *The Genius of Venice, 1500–1600* (1983). Other special studies include SIMON TOWNELEY WORSTHORNE, *Venetian Opera in the Seventeenth Century* (1954, reprinted 1984); MICHAEL LEVEY, *Painting in Eighteenth-Century Venice,* 3rd ed. (1994); and JOHN EGLIN, *Venice Transfigured: The Myth of Venice in British Culture, 1660–1797* (2001).   (D.E.C./J.Ft.)

Victoria and the Victorian Age

Victoria served as the queen of the United Kingdom of Great Britain and Ireland from 1837 until 1901. In 1876 she also became empress of India. During her reign the English monarchy took on its modern ceremonial character.

Victoria first learned of her future role as a young princess during a history lesson when she was 10 years old. Almost four decades later Victoria's governess recalled that the future queen reacted to the discovery by declaring, "I will be good." This combination of earnestness and egotism marked Victoria as a child of the age that bears her name. The queen, however, rejected important Victorian values and developments. A mother of nine who hated pregnancy and childbirth, detested babies, and was uncomfortable in the presence of children, Victoria reigned in a society that idealized both motherhood and the family. She had no interest in social issues, yet the 19th century in Britain was an age of reform. She resisted technological change even while mechanical and technological innovations reshaped the face of European civilization.

Most significantly, Victoria was a queen determined to retain political power; yet unwillingly and unwittingly she presided over the transformation of the sovereign's political role into a ceremonial one and thus preserved the English monarchy. When Victoria became queen, the political role of the crown was by no means clear; nor was the permanence of the throne itself. When she died and her son Edward VII moved from Marlborough House to Buckingham Palace, the change was one of social rather than of political focus; there was no doubt about the monarchy's continuance. That was the measure of her reign.

Transformation of the sovereign's role

Lineage and early life. On the death in 1817 of Princess Charlotte, daughter of the prince regent (later George IV), there was no surviving legitimate offspring of George III's 15 children. In 1818, therefore, three of his sons, the dukes of Clarence, Kent, and Cambridge, married to provide for the succession. The winner in the race to father the next ruler of Britain was Edward, duke of Kent, fourth son of

EB Inc

Queen Victoria.

King George III. His only child, christened Alexandrina Victoria, was born at Kensington Palace, London, on May 24, 1819. After his death and George IV's accession in 1820, Victoria became third in the line of succession to the throne after the Duke of York (died 1827) and the Duke of Clarence (subsequently William IV), whose own children died in infancy.

Victoria, by her own account, "was brought up very simply," principally at Kensington Palace, where her closest companions, other than her German-born mother, the Duchess of Kent, were her half sister, Féodore, and her governess, Louise (afterward the Baroness) Lehzen, a native of Coburg. An important father figure to the orphaned princess was her uncle Leopold, her mother's brother, who lived at Claremont, near Esher, Surrey, until he became king of the Belgians in 1831.

Victoria's childhood was made increasingly unhappy by the machinations of the Duchess of Kent's advisor, Sir John Conroy. In control of the pliable duchess, Conroy hoped to dominate the future queen of Britain as well. Persuaded by Conroy that the royal dukes, "the wicked uncles," posed a threat to her daughter, the duchess reared Victoria according to "the Kensington system," by which she and Conroy systematically isolated Victoria from her contemporaries and her father's family. Conroy thus aimed to make the princess dependent on and easily led by himself.

"The Kensington system"

Strong-willed, and supported by Lehzen, Victoria survived the Kensington system; when she ascended the throne in 1837, she did so alone. Her mother's actions had estranged her from Victoria and taught the future queen caution in her friendships. Moreover, her retentive memory did not allow her to forgive readily.

Accession to the throne. In the early hours of June 20, 1837, Victoria received a call from the archbishop of Canterbury and the lord chamberlain and learned of the death of William IV, third son of George III. Later that morning the Privy Council was impressed by the graceful assurance of the new queen's demeanour. She was small, carried herself well, and had a delightful silvery voice, which she retained all her life. The accession of a young woman was romantically popular. But because of the existence in Hanover of the Salic law, which prevented succession by a woman, the crowns of Great Britain and Hanover became separated, the latter passing to William IV's eldest surviving brother, Ernest, the unpopular duke of Cumberland.

The queen, who had never before had a room to herself, exiled her mother to a distant set of apartments when they moved into Buckingham Palace. Conroy was pensioned off. Only Lehzen, of whom Victoria was still in awe, remained close to the queen. Even her beloved uncle Leopold was politely warned 'off discussions of English politics. "Alone" at last, she enjoyed her new-found freedom. "Victoria," wrote her cousin, Prince Albert of Saxe-Coburg-Gotha, who later married her,

is said to be incredibly stubborn and her extreme obstinacy to be constantly at war with her good nature; she delights in Court ceremonies, etiquette and trivial formalities.... She is said not to take the slightest pleasure in nature and to enjoy sitting up at night and sleeping late into the day.

It was, in retrospect, "the least sensible and satisfactory time in her whole life"; but at the time it was exciting and enjoyable, the more so because of her romantic friendship with Lord Melbourne, the prime minister.

Melbourne was a crucial influence on Victoria, in many ways an unfortunate one. The urbane and sophisticated prime minister fostered the new queen's self-confidence and enthusiasm for her role; he also encouraged her to ignore or minimize social problems and to attribute all discontent and unrest to the activities of a small group

Lord Melbourne

of agitators. Moreover, because of Melbourne, Victoria became an ardent Whig.

Victoria's constitutionally dangerous political partisanship contributed to the first two crises of her reign, both of which broke in 1839. The Hastings affair began when Lady Flora Hastings, a maid of honour who was allied and connected to the Tories, was forced by Victoria to undergo a medical examination for suspected pregnancy. The gossip, when it was discovered that the queen had been mistaken, became the more damaging when later in the year Lady Flora died of a disease that had not been diagnosed by the examining physician. The enthusiasm of the populace over the coronation (June 28, 1838) swiftly dissipated.

Between the two phases of the Hastings case "the bedchamber crisis" intervened. When Melbourne resigned in May 1839, Sir Robert Peel, the Conservative leader, stipulated that the Whig ladies of the bedchamber should be removed. The queen imperiously refused, not without Melbourne's encouragement. "The Queen of England will not submit to such trickery," she said. Peel therefore declined to take office, which Melbourne rather weakly resumed. "I was very young then," wrote the queen long afterward, "and perhaps I should act differently if it was all to be done again."

The Albertine monarchy. Victoria's wedding to Prince Albert served as a stage for displays of political partisanship: very few Tories received invitations, and the Tories themselves rejected Victoria's request that Albert be granted rank and precedence second only to her own. Victoria responded violently, "Monsters! You Tories shall be punished. Revenge! Revenge!" Marriage to Albert, however, lessened the queen's enthusiasm for Melbourne and the Whigs. She admitted many years later regarding Melbourne that "Albert thinks I worked myself up to what really became rather foolish." Albert thus shifted Victoria's political sympathies; he also became the dominant figure and influence in her life. She quickly grew to depend on him for everything; soon she "didn't put on a gown or a bonnet if he didn't approve it." No more did Victoria rule alone.

Attracted by Albert's good looks and encouraged by her uncle Leopold, Victoria proposed to her cousin on Oct. 15, 1839, just five days after he had arrived at Windsor on a visit to the English court. She described her impressions of him in the journal she kept throughout her life: "Albert really is quite charming, and so extremely handsome . . . a beautiful figure, broad in the shoulders and a fine waist; my heart is quite *going.*" They were married on Feb. 10, 1840, the queen dressed entirely in articles of British manufacture.

Children quickly followed. Victoria, the princess royal (the "Vicky" of the *Letters*), was born in 1840; in 1858 she married the crown prince of Prussia and later became the mother of the emperor William II. The Prince of Wales (later Edward VII) was born in 1841. Then followed Princess Alice, afterward grand duchess of Hesse, 1843; Prince Alfred, afterward duke of Edinburgh and duke of Saxe-Coburg-Gotha, 1844; Princess Helena (Princess Christian of Schleswig-Holstein), 1846; Princess Louise (duchess of Argyll), 1848; Prince Arthur (duke of Connaught), 1850; Prince Leopold (duke of Albany), 1853; and Princess Beatrice (Princess Henry of Battenberg), 1857. The queen's first grandchild was born in 1859, and her first great-grandchild in 1879. There were 37 great-grandchildren alive at her death.

Victoria never lost her early passion for Albert: "Without him everything loses its interest." Despite conflicts produced by the queen's uncontrollable temper and recurrent fits of depression, which usually occurred during and after pregnancy, the couple had a happy marriage. Victoria, however, was never reconciled to the childbearing that accompanied her marital bliss—the "shadow-side of marriage," as she called it. Victoria explained to her eldest daughter in 1858:

What you say of the pride of giving life to an immortal soul is very fine, dear, but I own I cannot enter into that; I think much more of our being like a cow or a dog at such moments; when our poor nature becomes so very animal and unecstatic.

At the beginning of their marriage the queen was insistent that her husband should have no share in the government of the country. Within six months, on Melbourne's repeated suggestion, the prince was allowed to start seeing the dispatches, then to be present when the queen saw her ministers. The concession became a routine, and during her first pregnancy the prince received a "key to the secret boxes." As one unwanted pregnancy followed another and as Victoria became increasingly dependent on her husband, Albert assumed an ever-larger political role. By 1845 Charles Greville, the observer of royal affairs, could write, "it is obvious that while she has the title, he is really discharging the functions of the Sovereign. He is the King to all intents and purposes." Victoria, once so enthusiastic about her role, came to conclude that "we women are not *made* for governing."

The prince came into his own to negotiate with Peel a compromise on the bedchamber question after the Melbourne government had been defeated in the general election of 1841. The queen's first interview with Peel went well, eased by Melbourne's advice to his successor:

The Queen is not conceited—she is aware there are many things she cannot understand and she likes to have them explained to her elementarily—not at length and in detail but shortly and clearly.

If, as Lady Lyon once noted, "there was 'a vein of iron' which ran through the Queen's extraordinary character," the iron could bend; Victoria was able to revise her opinions and reevaluate her judgments. Peel's very real distress when in the summer of 1842 an attempt was made to assassinate the queen—together with the affinity between the prince and the new prime minister—soon converted the "cold odd man" of the queen's earlier comment into "a great statesman, a man who thinks but little of party and never of himself." Lord Aberdeen, the foreign secretary, also became a great favourite. "We felt so safe with them both," she told King Leopold.

The departure of the possessive Lehzen for Germany in 1842 signaled Albert's victory in the battle between the two for Victoria's loyalty and for power in the royal household. He became effectively the queen's private secretary—according to himself, "her permanent minister." As a result of Albert's diligence and refusal to accept the obstacles that ministers threw in his path, the management of the queen's properties was rationalized and her income thus increased.

A visible sign of the prince's power and influence was the building of the royal residences of Osborne, on the Isle of Wight, and Balmoral Castle in Scotland. Albert, who taught the once party-loving Victoria to despise London, played a central role in the acquisition of both properties as well as in designing the homes he and Victoria erected on them between 1845 and 1855.

Victoria described Osborne as "our island home" and retreated there frequently; it was, however, at Balmoral that she was happiest. The royal pair and their family were able to live there "with the greatest simplicity and ease," wrote Greville. The queen soon came to hold the Highlanders in more esteem than she held any other of her subjects. She liked the simpler life of the Highlands, as her published journal was to reveal: she came to make the most of the thin stream of Scottish blood in her veins; also, so long as the sermons were short enough, she came to prefer the Scottish form of religious service. "You know," she was to tell her prime minister, William Ewart Gladstone, "I am not much of an Episcopalian"; and she developed a comfort in the consolations of the Reverend Norman Macleod and also a delight in the plain speech of John Brown, the Highland servant who stalked with Albert and became her personal attendant.

The royal couple's withdrawal to Scotland and the Isle of Wight bore witness to a new sort of British monarchy. In their quest for privacy and intimacy Albert and Victoria adopted a way of life that mirrored that of their middle-class subjects, admittedly on a grander scale. Although Albert was interested in intellectual and scientific matters, Victoria's tastes were closer to those of most of her people. She enjoyed the novels of Charles Dickens and patronized the circus and waxwork exhibitions. Both Victoria and

[margin left:] Marriage to Albert

[margin right:] Relations with Peel

[margin right:] Preference for Balmoral

Albert, however, differed from many in the middle class in their shared preference for nudes in painting and sculpture. Victoria was not the prude that many claimed her to be. She was also no Sabbatarian: "I am not at all an admirer or approver of our very dull Sunday."

Victoria's delight in mingling with the Scottish poor at Balmoral did little to raise the level of her social awareness. Although in 1846 she and Albert supported the repeal of the Corn Laws (protectionist legislation that kept the price of British grain artificially high) in order to relieve distress in famine-devastated Ireland, they remained much more interested in and involved with the building of Osborne and foreign policy than in the tragedy of Ireland. Victoria, moreover, gave her full support to the government's policy of repression of the Chartists (advocates of far-reaching political and social reform) and believed the workers in her realm to be contented and loyal. In 1848, rejoicing in the failure of the last great Chartist demonstration in London, the queen wrote:

> The loyalty of the people at large has been very striking and their indignation at their peace being interfered with by such worthless and wanton men—immense.

The consequences of continental revolutions led her to conclude:

> Revolutions are always bad for the country, and the cause of untold misery to the people. Obedience to the laws and to the Sovereign, is obedience to a higher Power, divinely instituted for the good of the *people*, not the Sovereign, who has equally duties and obligations.

Yet, revolution or no revolution, many of her people lived in "untold misery," a fact Victoria rarely confronted.

For both the queen and the prince consort the highlight of their reign came in 1851, with the opening of the Great Exhibition. Albert poured himself into the task of organizing the international trade show that became a symbol of the Victorian Age. Housed in the architectural marvel of the Crystal Palace, a splendid, greenhouse-inspired glass building erected in Hyde Park, the Great Exhibition displayed Britain's wealth and technological achievements to a wondering world. To Victoria the success of the Great Exhibition provided further evidence of her husband's genius: "I *do* feel proud at the thought of what my beloved Albert's great mind has conceived." Profits from the Great Exhibition funded what became the South Kensington complex of colleges and museums.

Albert has been credited with teaching Victoria the importance of remaining above party. Certainly he saw the danger in the Whig partisanship she openly displayed before their marriage; more clearly than Victoria he realized the fine sense of balance required of a constitutional monarch. Albert's own actions, however, such as his much-criticized appearance in the gallery of the House of Commons during Peel's speech on the first day of the Corn Laws debates (and thus his open and partisan show of support for Peel), revealed his political sympathies. Gladstone noted in 1846 that

> the Prince is very strongly Conservative in his politics and his influence with the Q. is over-ruling; through him she has become so attached to Conservative ideas that she could hardly endure the idea of the opposite Party as her ministers.

Like the queen, Albert believed that the sovereign had an important and active role to play in British politics. The fluid political situation operating during the prince's lifetime made such an active role seem possible. After the repeal of the Corn Laws (1846) there was a period, not ending until the election of 1868, when politics tended to consist of a series of temporary alliances between splinter groups and no single group could guarantee its extended control over the House of Commons: the golden age of the private member, a condition rendering active political intervention by the crown not only possible but sometimes even necessary. There was a role for the cabinet maker, especially in helping to compose coalitions. Its significance must not, however, be overemphasized; although Victoria probably would not have admitted it, the queen's role, albeit "substantial," was always "secondary."

The tradition also persisted that the sovereign had a special part to play in foreign affairs and could conduct them alone with a secretary of state. Victoria and Albert had relatives throughout Europe and were to have more. Moreover, they visited and were visited by other monarchs. Albert was determined that this personal intelligence should not be disregarded and that the queen should never become (as his own mentor the Baron Stockmar had indicated) "a mandarin figure which has to nod its head in assent or shake it in denial as its Minister pleases." The result was a clash with Lord Palmerston, the foreign secretary, who could look back on a career of high office beginning before the royal couple was born. The prince distrusted Palmerston's character, disapproved of his methods, thought his policy shallow, and disagreed with his concept of the constitution.

Even after Victoria insisted to Palmerston in 1850, "having once given her sanction to a measure, that it be not arbitrarily altered or modified by the minister," the foreign secretary continued to follow policies disapproved of by both Albert and Victoria, such as his encouragement of nationalist movements that threatened to dismember the Austrian Empire. Finally, after Palmerston expressed his approval of the coup d'état of Louis Napoleon (later Napoleon III) in 1851 without consulting the queen, the prime minister, Lord John Russell, dismissed him. Within a few months the immensely popular Palmerston was back in office, however, as home secretary. He would serve twice as prime minister. After Albert's death Victoria's disapproval of Palmerston diminished; his conservative domestic policy and his insistence that Britain receive its due in world affairs accorded with her own later views.

On the eve of the Crimean War (1854–56) the royal pair encountered a wave of unpopularity, and Albert was suspected, without any foundation, of trying to influence the government in favour of the Russian cause. There was, however, a marked revival of royalist sentiment as the war wore on. The queen personally superintended the committees of ladies who organized relief for the wounded and eagerly seconded the efforts of Florence Nightingale: she visited crippled soldiers in the hospitals and instituted the Victoria Cross for gallantry.

With the death of Prince Albert on Dec. 14, 1861, the Albertine monarchy came to an end. Albert's influence on the queen was lasting. He had changed her personal habits and her political sympathies. From him she had received training in orderly ways of business, in hard work, in the expectation of royal intervention in ministry making at home, and in the establishment of a private (because royal) intelligence service abroad. The English monarchy had changed. As the historian G.M. Young said, "In place of a definite but brittle prerogative it had acquired an undefinable but potent influence."

Widowhood. After Albert's death Victoria descended into deep depression—"those paroxysms of despair and yearning and longing and of daily, nightly longing to die . . . for the first three years never left me." Even after climbing out of depression, she remained in mourning and in partial retirement. She balked at performing the ceremonial functions expected of the monarch and withdrew to Balmoral and Osborne four months out of every year, heedless of the inconvenience and strain this imposed on ministers. After an initial period of respect and sympathy for the queen's grief, the public grew increasingly impatient with its absent sovereign. No one, however, could budge the stubborn Victoria.

Although Victoria resisted carrying out her ceremonial duties, she remained determined to retain an effective political role in the period after Albert's death and to behave as he would have ordained. Her testing point was, then, her "dear one's" point of view; and this she had known at a particular and thereafter not necessarily relevant period in English political life. Her training and his influence were ill suited to the "swing of the pendulum" politics that better party organization and a wider electorate enjoined after the Reform Bill of 1867. And since she blamed her son and heir for Albert's death—the prince consort had come back ill from Cambridge, where he had gone to see the Prince of Wales regarding an indiscretion the young prince had committed in Ireland—she did not hesitate to vent her loneliness upon him or to refuse him all responsibility. "It quite irritates me to see him in the room," she

The Great Exhibition (margin note)

Foreign affairs (margin note)

Crimean War (margin note)

startled Lord Clarendon by saying. The breach was never really healed, and as time went on the queen was clearly envious of the popularity of the Prince and Princess of Wales. She liked to be, but she took little trouble to see that she was, popular.

It was despite, yet because of, Albert that Victoria succumbed to Benjamin Disraeli and thus made herself a partisan in the most famous political rivalry of the 19th century. Albert had thought Disraeli insufficiently a gentleman and remembered his bitter attacks on Peel over the repeal of the Corn Laws in 1846; the prince, on the other hand, had approved of Gladstone, Disraeli's political rival. Yet Disraeli was able to enter into the queen's grief, flatter her, restore her self-confidence, and make the lonely crown an easier burden. Behind all his calculated attacks on her affections there was a bond of mutual loneliness, a note of mystery and romanticism, and, besides, the return to good

Disraeli gossip. Disraeli, moreover, told the queen in 1868 that it would be "his delight and duty, to render the transaction of affairs as easy to your Majesty, as possible." Since the queen was only too ready to consider herself overworked, this approach was especially successful. Gladstone, on the other hand, would never acknowledge that she was, as she put it, "dead beat," perhaps because he never was himself; Disraeli, however, tired easily. The contrast between Disraeli's gay, often malicious, gossipy letters and Gladstone's 40 sides of foolscap is obvious. And there was no Albert to give her a neat précis. Gladstone, moreover, held the throne as an institution in such awe that it affected his relations with its essentially feminine occupant. His "feeling" for the crown, said Lady Ponsonby, was "always snubbed." The queen had no patience with Gladstone's moralistic (and, she believed, hypocritical) approach to politics and foreign affairs. His persistent and often tactless attempts to persuade her to resume her ceremonial duties especially enraged her.

Over the problem of Ireland their paths separated ever more widely. Whereas "to pacify Ireland" had become the "mission" of Gladstone's life, the queen (like the majority of her subjects) had little understanding of, or sympathy for, Irish grievances. She disliked disorder and regarded the suggestion of Irish Home Rule as sheer disloyalty. The proposal of an Irish "Balmoral" was repugnant to her, especially when it was suggested that the Prince of Wales might go in her place. To avoid the Irish Sea, she claimed to be a bad sailor; yet she was willing in her later years to cross the English Channel almost every year. In all, she made but four visits to Ireland, the last in 1900 being provoked by her appreciation of the gallantry of the Irish regiments in the South African War.

Gladstone's The news of Gladstone's defeat in 1874 delighted the
defeat in queen. "What an important turn the elections have taken,"
1874 she wrote.

It shows that the country is not *Radical.* What a triumph, too, Mr. Disraeli has obtained and what a good sign this large Conservative majority is of the state of the country, which really required (as formerly) a strong Conservative party!

If, years before, Melbourne, almost despite himself, had made her a good little Whig, and if Albert had left her, in general, a Peelite, temperamental and subsequently doctrinal differences with Gladstone helped make it easy for Disraeli to turn Victoria into a stout supporter of the Conservative Party.

One of the bonds shared by Victoria and Disraeli was a romantic attachment to the East and the idea of empire. Although she supported Disraeli's reform of the franchise in 1867, Victoria had little interest in or sympathy with his program of social reform; she was, however, entranced by his imperialism and by his assertive foreign policy. She applauded his brilliant maneuvering, which led to the British purchase of slightly less than half of the shares in the Suez Canal in 1875 (a move that prevented the canal from falling entirely under French control), especially since he presented the canal as a personal gift to her: "It is just settled; you have it, Ma'am." The addition of "Empress of India" in 1876 to the royal title thrilled the queen even more. Victoria and Disraeli also agreed on their answer to the vexing "Eastern question"—what was to be done with the declining Turkish empire? Even the

revelation of Turkish atrocities against rebelling Bulgarians failed to sway the sovereign and her prime minister from their position that Britain's best interests lay in supporting Turkey, the "Sick Man" of Europe. The fact that Gladstone took the opposing view, of course, strengthened their pro-Turkish sympathies. With the outbreak of a Russo-Turkish war in 1877, however, Disraeli found himself in the uncomfortable position of having to restrain his bellicose sovereign, who demanded that Britain enter the war against Russia. At the Congress of Berlin in 1878 Disraeli emerged triumphant: Russian influence in the Balkans was reduced, and Britain gained control of the strategically located island of Cyprus. The queen was ecstatic.

Victoria's delight in Disraeli's premiership made further conflict with Gladstone inevitable. When in September 1879 a dissolution of Parliament seemed imminent, the queen wrote to the Marchioness of Ely (who was, after the Duchess of Argyll, perhaps her most intimate friend):

Dear Janie, . . . I hope and trust the Government will be able to go on after the Election, as change is so disagreeable and so bad for the country; but if it should *not*, I wish the *principal* people of the Opposition should *know* there *are certain* things which *I never can* consent to. . . .

I never COULD take Mr. Gladstone . . . as my Minister again, for I never could have the slightest *particle* of confidence in Mr. Gladstone *after* his violent, mischievous, and dangerous conduct for the last three years.

After the blow fell with the Conservative Party's defeat
in 1880, Victoria sent for Lord Hartington.

Conserva-
tive defeat
in 1880

Mr. Gladstone *she* could have nothing to do with, for she considers his whole conduct since '76 to have been one series of violent, passionate invective against and abuse of Lord Beaconsfield, and that *he caused* the Russian war.

Nevertheless, as Hartington pointed out, it was Gladstone whom she had to have. She made no secret of her hostility, she hoped he would retire, and she remained in correspondence with Lord Beaconsfield (as Disraeli had become). Gladstone, indeed, said that he himself "would never be surprised to see her turn the Government out, after the manner of her uncles." The queen abhorred Gladstone's lack of Disraelian vision of Britain's role in the world. Over the abandonment of Kandahar in Afghanistan, in 1881, for example, Sir Henry Ponsonby had never seen her so angry: "The Queen has never before been treated," she told him, "with such want of respect and consideration in the forty three and a half years she has worn her thorny crown."

Victoria convinced herself that Gladstone's government, dominated (she believed) by Radicals, threatened the stability of the nation:

No one is more truly Liberal in her heart than the Queen, but she has always strongly deprecated the great tendency of the present Government to encourage instead of checking the stream of destructive democracy which has become so alarming. . . . She will not be a Sovereign of a Democratic Monarchy.

Nevertheless, Victoria did act as an important mediating influence between the two houses to bring about the compromise that resulted in the third parliamentary Reform Act in 1884.

Victoria never acclimatized herself to the effects of the new electorate on party organization. No longer was the monarchy normally necessary as cabinet maker; yet, the queen was reluctant to accept her more limited role. Thus, in 1886 she sought to avoid a third Gladstone ministry by attempting to form an anti-Radical coalition. Her attempt failed. Irish Home Rule, not the queen, would defeat the "People's William."

Last years. In the Salisbury administration (1895–1902), with which her long reign ended, Victoria was eventually to find not only the sort of ministry with which she felt comfortable but one which lent a last ray of colour to her closing years by its alliance, through Joseph Chamberlain, with the mounting imperialism that she had so greatly enjoyed in Disraeli's day when he had made her empress of India.

The South African War (1899–1902) dominated her final years. The sufferings of her soldiers in South Africa aroused the queen to a level of activity and public visibil-

ity that she had avoided for decades. With a demanding schedule of troop inspections, medal ceremonies, and visits to military hospitals, Victoria finally became the exemplar of a modern monarch.

Victoria absorbed a great deal of the time of her ministers, especially Gladstone's, but after 1868 it may be doubted whether, save in rare instances, it made a great deal of difference. She may have postponed an occasional evil day; she certainly hampered an occasional career. And sometimes that "continuous political experience," which Walter Bagehot remarked as a long-lived monarch's greatest asset, was invaluable: in stopping "red tapings," as the queen called them, or in breaking a logjam. Meanwhile— "a comparatively late growth"—she had gained the affection of her subjects. The sheer endurance of her reign in a time of swift change deepened her symbolic value and hence heightened her popularity. Lord Salisbury observed in the House of Lords (Jan. 25, 1901) after her death that:

She had an extraordinary knowledge of what her people would think—extraordinary, because it could not come from any personal intercourse. I have said for years that I have always felt that when I knew what the Queen thought, I knew pretty certainly what views her subjects would take, and especially the middle class of her subjects.

The queen, as the Jubilees of 1887 and 1897 showed, was popular. Gone were the days when pamphlets were circulated asking what she did with her money. More and more fully with advancing years, she was able to satisfy the imagination of the middle class—and the poorer class— of her subjects.

She remained, nevertheless, either aloof from or in opposition to many of the important political, social, and intellectual currents of the later Victorian period. She never reconciled herself to the advance of democracy, and she thought the idea of female suffrage anathema. The sufferings of an individual worker could engage her sympathy; the working class, however, remained outside her field of vision. After Albert's death Victoria had little contact with intellectual and artistic subjects and so remained happily unaware of the unsettling new directions being explored in the world around her. Her reign was shaped by the new technology—without the railroad and the telegraph, her extended stays in Osborne and Balmoral would have been impossible—yet she never welcomed innovation.

Character and personality

Many of the movements of the day passed the aged queen by, many irritated her, but the stupendous hard work that Albert had taught her went on—the meticulous examination of the boxes, the regular signature of the papers. To the very end Victoria remained a passionate and strong-willed woman.

Those who were nearest to her came completely under her spell; yet all from the Prince of Wales down stood in considerable awe. A breach of the rules could still make a fearsome change in the kindly, managing great-grandmother in black silk dress and white cap. The eyes would begin to protrude, the mouth to go down at the corners. Those who suffered her displeasure never forgot it, nor did she. Yielding to nobody else's comfort and keeping every anniversary, she lived surrounded by mementos, photographs, miniatures, busts, and souvenirs in chilly rooms at the end of drafty corridors, down which one tiptoed past Indian attendants to the presence. Nobody knocked; a gentle scratching on the door was all that she permitted. Every night at Windsor Albert's clothes were laid out on the bed, every morning fresh water was put in the basin in his room. She slept with a photograph—over her head—taken of his head and shoulders as he lay dead.

Queen Victoria had fought a long rearguard action against the growth of "democratic monarchy"; yet, in some ways, she had done more than anyone else to create it. She had made the monarchy respectable and had thereby guaranteed its continuance—not as a political power but as a political institution. Her long reign had woven a legend, and, as her political power ebbed away, her political value grew. It lay, perhaps, more in what the electorate thought of her, indeed felt about her, than in what she ever was or certainly ever believed herself to be. Paradoxically enough, her principal contribution to the British monarchy and her political importance lay in regard to those "dignified" functions that she was accused of neglecting rather than to the "business" functions that, perhaps sometimes, she did not neglect enough.

Death

The queen died at Osborne on Jan. 22, 1901, after a short and painless illness. "We all feel a bit motherless today," wrote Henry James, "mysterious little Victoria is dead and fat vulgar Edward is King." She was buried beside Prince Albert in the mausoleum at Frogmore near Windsor. Young said,

She had lived long enough. The idol of her people, she had come to press on the springs of government with something of the weight of an idol, and in the innermost circle of public life the prevailing sentiment was relief.

Her essential achievement was simple. By the length of her reign, the longest in English history, she had restored both dignity and popularity to a tarnished crown: an achievement of character, as well as of longevity. Historians may differ in their assessment of her political acumen, her political importance, or her role as a constitutional monarch. None will question her high sense of duty or the transparent honesty, the massive simplicity, of her royal character.

BIBLIOGRAPHY. The most important authority for the queen's life is *The Letters of Queen Victoria* in three series: for the years 1837–61, ed. by ARTHUR CHRISTOPHER BENSON and VISCOUNT ESHER (REGINALD B. ESHER), 3 vol. (1907); for 1862–85, ed. by GEORGE EARLE BUCKLE, 3 vol. (1926–28); and for 1886–1901, ed. by GEORGE EARLE BUCKLE, 3 vol. (1930–32). See also HECTOR BOLITHO (ed.), *Letters of Queen Victoria,* trans. from German (1938; U.K. title, *Further Letters of Queen Victoria,* 1938, reprinted 1976). Correspondence between the queen and her eldest daughter was edited by ROGER FULFORD: *Dearest Child* (1964, reissued 1977), covering the years 1858–61; *Dearest Mama* (1968, reissued 1977), covering 1861–64; *Your Dear Letter* (1971), covering 1865–71; *Darling Child* (1976), covering 1871–78; and *Beloved Mama* (1981), covering 1878–85. Her correspondence with Gladstone is collected in PHILIP GUEDALLA (ed.), *The Queen and Mr. Gladstone,* 2 vol. (1933); and with Palmerston in BRIAN CONNELL (ed.), *Regina vs. Palmerston* (1961), covering the years 1837–65. See also HOPE DYSON and CHARLES TENNYSON (eds.), *Dear and Honoured Lady: The Correspondence Between Queen Victoria and Alfred Tennyson* (1969, reissued 1971). *Leaves from the Journal of Our Life in the Highlands from 1848 to 1861* (1868, reprinted 1969), and *More Leaves from the Journal of a Life in the Highlands, from 1862 to 1882* (1884), both ed. by ARTHUR HELPS, were published in the queen's lifetime and played their part in eventually securing public affection. Selections from these two journals were published in DAVID DUFF (ed.), *Queen Victoria's Highland Journals,* new and rev. ed. (1980). See also CHRISTOPHER HIBBERT, *Queen Victoria in Her Letters and Journals: A Selection* (1984).

Important biographies are LYTTON STRACHEY, *Queen Victoria* (1921; reissued with the title *The Illustrated Queen Victoria,* 1987), which was written before the second and third series of her *Letters* had been published; ELIZABETH LONGFORD, *Victoria R.I.* (1964; U.S. title, *Queen Victoria: Born to Succeed,* 1965, reprinted 1974); CECIL WOODHAM-SMITH, *Queen Victoria, from Her Birth to the Death of the Prince Consort* (U.K. title, *Queen Victoria: Her Life and Times,* 1972); DOROTHY MARSHALL, *The Life and Times of Victoria* (1972); and STANLEY WEINTRAUB, *Victoria: An Intimate Biography* (U.K. title, *Victoria: Biography of a Queen,* 1987).

Additional sources on her private life include MARINA WARNER, *Queen Victoria's Sketchbook* (1979), a collection of the queen's artistic works with accompanying narrative text; TYLER WHITTLE (MICHAEL SIDNEY TYLER-WHITTLE), *Victoria and Albert at Home* (1980); RONALD W. CLARK, *Balmoral, Queen Victoria's Highland Home* (1981); ROBERT RHODES JAMES, *Albert, Prince Consort: A Biography* (1983; U.S. title, *Prince Albert: A Biography,* 1984); and DELIA MILLAR, *Queen Victoria's Life in the Scottish Highlands: Depicted by Her Watercolour Artists* (1985). Studies of the queen's reign are FRANK HARDIE, *The Political Influence of Queen Victoria, 1861–1901,* 2nd ed. (1938, reissued 1963); HECTOR BOLITHO, *The Reign of Queen Victoria* (1948); THEO ARONSON, *Victoria and Disraeli: The Making of a Romantic Partnership* (1977, reprinted 1987); JEFFREY L. LANT, *Insubstantial Pageant: Ceremony and Confusion at Queen Victoria's Court* (1979); JOHN MAY, *Victoria Remembered: A Royal History, 1817–1861, Entirely Illustrated by Commemoratives* (1983); and BARRY ST.-JOHN NEVILL (ed.), *Life at the Court of Queen Victoria, 1861–1901* (1984).

Vienna

The capital city of Austria, Vienna (German: Wien) is also one of the country's nine *Bundesländer* (federal states)—the smallest in area but the largest in population. Modern Vienna has undergone several historical incarnations. From 1558 to 1918 it was an imperial city—until 1806 the seat of the Holy Roman Empire and then the capital of the Austro-Hungarian Empire. In 1918 it became the capital of a truncated, landlocked central European country that emerged from World War I a republic by choice. From 1938 to 1945 Austria was a part of Hitler's "Greater" Germany, and Vienna became "Greater" Vienna, reflecting the Nazi revision of the city limits. In the decade following World War II, Austria was occupied by British, French, American, and Soviet forces, and Vienna was divided into five zones, including an international zone, covering the Innere Stadt ("Inner City"). In 1955 the State Treaty, by which the country regained independence, was signed with the four occupying powers, and Vienna became once again the capital of a sovereign Austria.

Vienna is among the least spoiled of the great old western European capitals. Its central core, the Innere Stadt, is easily manageable by foot and public transportation. In a city renowned for its architecture, many of Vienna's urban prospects remain basically those devised over several centuries by imperial gardeners and architects. The skyline is still dominated by the spire of St. Stephen's Cathedral and by the giant Ferris wheel in the city's chief park, the Prater. The city suffered heavy damage in the last months of World War II, and much rebuilding was done after the war. Nevertheless, the character of Vienna as a whole remains much the same as in the years before 1914.

Viennese *Lebenskunst* ("art of living") has survived changing rulers and times. It is still possible to live in Vienna at almost the same pace and in much the same style as it was a century ago. The same music is played in the same rebuilt concert halls, and a theatrical or operatic success still stimulates lively conversation. One can drink the same sourish local wines in the taverns on the outskirts of town, consume the same mountains of whipped cream at Sacher's and Demel's, and sample the same infinite varieties of coffee in countless cafés. Thick woolen suits and overcoats in shades of green, gray, or brown loden cloth and colourful dirndl dresses are still the fashion. It is even possible for tourists, and for others on festive occasions, to ride in a traditional fiacre, the two-horse carriage driven by a bowler-hatted coachman.
